

**FINAL
PROGRAM ENVIRONMENTAL IMPACT REPORT

FOR THE

BBARWA, BBCCSD, BBLDWP, AND BBMWD
REPLENISH BIG BEAR PROGRAM**

Lead Agency:

Big Bear Area Regional Wastewater Agency (BBARWA)
121 Palomino Drive, PO Box 517
Big Bear City, California 92314
(909) 585-4018

Prepared for:

**Big Bear Area Regional Wastewater Agency (BBARWA)
Big Bear City Community Services District (BBCCSD),
City of Big Bear Lake Department of Water & Power (BBLDWP),
and Big Bear Municipal Water District (BBMWD)**

Prepared by:

Tom Dodson & Associates
2150 North Arrowhead Avenue
San Bernardino, California 92405

MEMORANDUM

April 17, 2024

From: Kaitlyn Dodson-Hamilton

To: Mrs. Bridgette Burton

Subj: Completion of the Replenish Big Bear Program Final Program Environmental Impact Report (SCH #2022110595)

The Big Bear Area Regional Wastewater Agency (BBARWA) distributed the Replenish Big Bear Program Draft Program Environmental Impact Report (DPEIR) (SCH #2022110595) for public review with the review starting on December 21, 2023, and ending on February 20, 2024. BBARWA received written comment letters from 23 persons/entities on the proposed Replenish Big Bear Program DPEIR, with a 24 comment letter serving as a compilation of the requests for a time extension for the public review period, which was granted. The comments are responded to herein. The contents of a Final PEIR (FPEIR) are defined in Section 15132 of the State California Environmental Quality Act (CEQA) Guidelines and include the following requirements: the DPEIR; comments and recommendations received on the DPEIR; a list of parties commenting on the DPEIR; Responses to Comments by the CEQA Lead Agency (BBARWA); a mitigation monitoring and reporting program (MMRP); a set of facts, findings and statement of overriding considerations (SOOC, where required); and, any other information added by the Lead Agency as part of its decision-making process for a project. Because the DPEIR identified unavoidable significant adverse impacts that could not be mitigated, a SOOC is required as part of the decision-making package before the FPEIR can be certified. This memorandum and the attached Responses to Comments contained herein constitute a portion of the FPEIR for BBARWA on this proposed project.

The following parties submitted written comments. BBARWA's responses to those letters are provided in the attached Responses to Comments:

1. Time Extension Requests from:
 - Friends of Big Bear Valley
 - California Department of Fish and Wildlife
 - Sierra Club Big Bear Group
2. Lucerne Valley Economic Development Agency (LVEDA)
3. Water Infrastructure Finance and Innovation Act (WIFIA) Management Division of the Office of Wastewater Management and Office of Water, United States Environmental Protection Agency (EPA)
4. South Coast Air Quality Management District (SCAQMD)
5. Joe Cylwik

6. John Johnstone
7. Sam Fuller of Bear Valley Mutual Water Company (BVMWD)
8. Scott Pinkerton
9. San Bernardino County Department of Public Works
10. Jim Sperling
11. Robin Sperling
12. Doug Perling
13. Sierra Club Big Bear Group
14. Steve Ludecke
15. Tim Krantz
16. State Water Resources Control Board (SWRCB)
17. Santa Ana Regional Water Quality Control Board (SARWQCB)
18. City of Redlands
19. Friends of Big Bear Valley (FBBV)
20. California Department of Fish and Wildlife (CDFW)
21. Mojave Water Agency (MWA)
22. Tom Sitton
23. Bear Valley Mutual Water Company (BVMWC)
24. San Bernardino Valley Municipal Water District (SBVMWD)

This memorandum, combined with the DPEIR, the above list of commenters, the attached comment letters and responses, the MMRP, SOOC, and other staff materials in the final administrative record constitute the FPEIR for the proposed project. BBARWA will hold a meeting on May 22 at 5:00 PM or thereafter to consider certification of the FPEIR. The meeting will be held in BBARWA Board room at BBARWA located at the BBARWA's Headquarters, Board Room, 121 Palomino Drive, Big Bear City, CA 92314.

After review and response to all of the comments and incorporation of the Errata summarizing the project's evolution since the DPEIR was published, the Final PEIR identifies the same potential significant adverse impacts as were forecast in the Draft PEIR. After taking into consideration the comments submitted by the above parties, the data and analysis continue to indicate that three significant impacts to the environment, Agricultural & Forestry Resources, Biological Resources, Hydrology and Water Quality, and Utilities and Service Systems may result from implementing the proposed project. The data in the FPEIR support a finding that all other potential adverse environmental impacts are either less than significant without mitigation, or are less than significant with implementation of the identified mitigation measures. This finding is consistent with that identified in the DPEIR. No recirculation of the DPEIR will be necessary. The FPEIR package is now ready for consideration and certification by the BBARWA Board.

Do not hesitate to give me a call if you have any questions regarding the contents of this package.

Comment Letter #1 Group of Comments Requesting a Time Extension of the Public Review Period on the Replenish Big Bear DPEIR

P.O. Box 422, Fawnskin, California 92333
www.friendsofbigbearvalley.org fobbvinfo@gmail.com
909-878-3091

24 January 2024

Bridgette Burton
Big Bear Area Regional Wastewater Agency
121 Palomino Drive
P.O. Box 517
Big Bear City, CA 92314

Sent via email: bburton@bbarwa.org

Dear Ms. Burton,

Friends of Big Bear Valley would like to request a 30-day extension on the February 5, 2024 deadline for comments on the Replenish Big Bear Program Environmental Impact Report that was released on December 19, 2023.

1-1

The released documents include thousands of pages of scientifically detailed materials to be reviewed and the documents were released during the end of year holidays when many people are on holiday. Together, these conditions greatly minimize the ability of the public to adequately review the materials and provide meaningful comments.

We, along with other individuals and organizations we are aware of, would greatly appreciate this extension so that everyone interested has the time and resources to be able to review these materials properly.

Thank you for your consideration. I look forward to hearing back from you.
Sincerely,

A handwritten signature in cursive script that reads "Sandy Steers".

Sandy Steers
Executive Director

**NOTICE OF TIME EXTENSION OF PUBLIC REVIEW AND COMMENT PERIOD
FOR THE DRAFT PROGRAM EIR FOR PUBLIC REVIEW
FOR THE REPLENISH BIG BEAR PROGRAM
STATE CLEARINGHOUSE NO. 2022110595**

In accordance with the California Environmental Quality Act (CEQA), the Big Bear Area Regional Wastewater Agency (BBARWA), as the Lead Agency, has completed a Draft Program Environmental Impact Report (DPEIR), pursuant to the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, for the Replenish Big Bear Program (Program)(State Clearinghouse # 2022110595). A Notice of Availability of a DPEIR for the Replenish Big Bear Program was previously distributed to the public on December 21, 2023, which began a 45-day public review and comment period. Thus, this notice is to announce that the public comment period has been extended to Tuesday, February 20, 2024 at 5:00 PM to allow the public a total of 60 days to submit public comments on the Replenish Big Bear Program DPEIR.

Project Location

The Program will span just east of Big Bear Lake to the Wastewater Treatment Plant (WWTP) at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the Bear Mountain Ski Resort Storage Pond and Sand Canyon Recharge Area. Each of these elements are discussed in further detail below. The Program is located within several USGS 7.5-minute topographic maps, including the following: Big Bear City, CA; Big Bear Lake, CA Moonridge, CA; and, San Geronio, CA. The central point for this Program is the BBARWA WWTP site, for which the geographic coordinates of the proposed project are 34.268906°, -116.815575°, which is located in Section 7, Township 2 North, Range 2 East of the Big Bear City, CA USGS 7.5-minute topographic map.

Project Description

The Program includes permitting, design, and construction of an Advanced Water Purification Facility (AWPF) at the existing BBARWA WWTP, about 6.59 miles of pipeline for Program Water and reverse osmosis (RO), brine minimization, three pump stations, groundwater

recharge, and up to four monitoring wells to implement a Program that would retain recycled water in the Big Bear Valley for beneficial use to increase the sustainability of local water supplies. The Program is currently estimated to produce approximately 1,950 acre-feet per year (AFY) of high-quality Program Water, and may produce up to 2,200 AFY by 2040 through utilization of a high-recovery brine minimization technology. The Program includes the following uses and benefits:

- Sustain Stanfield Marsh Habitat and Increase Educational Opportunities: By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained, and educational opportunities for the community and visitors would be created;
- Enhance Big Bear Lake Benefits: The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- Expand Local Water Supplies: When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin;
- Sustain Unarmored Threespine Stickleback Fish with Program Water: To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater.

Environmental Documentation and Review Period

Electronic copies of the entire Program DPEIR can be accessed at:

<https://www.replenishbigbear.com/eir-process>. The DPEIR is available for **an additional fifteen (15) days, with public review period now ending on February 20, 2024**. Any person wishing to comment on the DPEIR may provide written comments by 5:00 PM on February 20, 2024 addressed as follows:

Bridgette Burton

1-2

Good afternoon, Bridgette,
Would you be able to grant CDFW a 1-week extension to submit comments regarding the EIR for the Replenish Big Bear Program (SCH: 2022110595)? We should have comments ready by Monday, February 12th if possible.
Best,

Alyssa Hockaday

Senior Environmental Scientist (Specialist)
California Department of Fish and Wildlife
Inland Deserts Region (6) - Habitat Conservation Program
3602 Inland Empire Blvd, Suite C-220, Ontario, CA 91764
Cell: (760) 920-8252

1-2 The comment by CDFW requests a time extension on the public circulation period for the DPEIR. The commenter was notified that the public comment period was extended through February 20 to provide commenters additional time to make public comment on the DPEIR.

Comment Letter # I
Group of Comments Requesting a Time
Extension of the Public Review Period
on the Replenish Big Bear DPEIR

Dear Ms Burton

The Big Bear Group of the Sierra Club would like to request an extension of 30 days to the review period for this report which was released on 12/19/2023, just prior to the holiday season. We are limited in the number of volunteers that have the ability to review and respond to this lengthy document. This extension would be greatly appreciated and allow us to provide the best response possible.

Sincerely

Ed Wallace,
Conservation Chair Sierra Club Big Bear Group

**NOTICE OF TIME EXTENSION OF PUBLIC REVIEW AND COMMENT PERIOD
FOR THE DRAFT PROGRAM EIR FOR PUBLIC REVIEW
FOR THE REPLENISH BIG BEAR PROGRAM
STATE CLEARINGHOUSE NO. 2022110595**

In accordance with the California Environmental Quality Act (CEQA), the Big Bear Area Regional Wastewater Agency (BBARWA), as the Lead Agency, has completed a Draft Program Environmental Impact Report (DPEIR), pursuant to the California Environmental Quality Act (CEQA) and the State CEQA Guidelines, for the Replenish Big Bear Program (Program)(State Clearinghouse # 2022110595). A Notice of Availability of a DPEIR for the Replenish Big Bear Program was previously distributed to the public on December 21, 2023, which began a 45-day public review and comment period. Thus, this notice is to announce that the public comment period has been extended to Tuesday, February 20, 2024 at 5:00 PM to allow the public a total of 60 days to submit public comments on the Replenish Big Bear Program DPEIR.

Project Location

The Program will span just east of Big Bear Lake to the Wastewater Treatment Plant (WWTP) at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the Bear Mountain Ski Resort Storage Pond and Sand Canyon Recharge Area. Each of these elements are discussed in further detail below. The Program is located within several USGS 7.5-minute topographic maps, including the following: Big Bear City, CA; Big Bear Lake, CA Moonridge, CA; and, San Gorgonio, CA. The central point for this Program is the BBARWA WWTP site, for which the geographic coordinates of the proposed project are 34.268906°, -116.815575°, which is located in Section 7, Township 2 North, Range 2 East of the Big Bear City, CA USGS 7.5-minute topographic map.

Project Description

The Program includes permitting, design, and construction of an Advanced Water Purification Facility (AWPF) at the existing BBARWA WWTP, about 6.59 miles of pipeline for Program Water and reverse osmosis (RO), brine minimization, three pump stations, groundwater recharge, and up to four monitoring wells to implement a Program that would retain recycled water in the Big Bear Valley for beneficial use to increase the sustainability of local water supplies. The Program is currently estimated to produce approximately 1,950 acre-feet per year (AFY) of high-quality Program Water, and may produce up to 2,200 AFY by 2040 through utilization of a high-recovery brine minimization technology. The Program includes the following uses and benefits:

- Sustain Stanfield Marsh Habitat and Increase Educational Opportunities: By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained, and educational opportunities for the community and visitors would be created;
- Enhance Big Bear Lake Benefits: The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- Expand Local Water Supplies: When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin;
- Sustain Unarmored Threespine Stickleback Fish with Program Water: To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater.

Environmental Documentation and Review Period

Electronic copies of the entire Program DPEIR can be accessed at: <https://www.replenishbigbear.com/eir-process>. The DPEIR is available for **an additional fifteen (15) days, with public review period now ending on February 20, 2024**. Any person wishing to comment on the DPEIR may provide written comments by 5:00 PM on February 20, 2024 addressed as follows:

Ms. Hockaday,

Thank you for your email of January 25th, which requested an extension of the formal CEQA comment period on the Draft EIR for the Replenish Big Bear Program (State Clearinghouse # 2022110595). BBARWA's General Manager is reviewing your request.

Please be assured that any comments that are received prior to any Governing Board meeting will be reviewed by staff and also provided to the Governing Board members for consideration prior to any action.

Thank you,

**RESPONSE TO COMMENT
LETTER #2
LVEDA**

- 2-1 The comment requests a hard copy of the DPEIR for the Lucerne Valley Library. BBARWA responded with the following *“Due to staffing levels, we will not be able to print and deliver to the Lucerne Valley Library until after the holidays. In the meantime, interested parties can access the DPEIR online using library computers through the link provided on the NOA.”* The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 2-2 The comment acknowledges BBARWA’s Response to Comment 2-1. BBARWA responded with the following in response to this comment “I don’t have any other copies - the printer quote is \$1k. Let me know how you would like to proceed.” The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 2-3 The comment notes that the document is too costly to print and acknowledges that the LVEDA will take charge of summarizing the DPEIR for its list. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

P. O. Box 193
Lucerne Valley, CA 92356
760 964 3118 chuckb193@outlook.com

(Note: In *blue italics* are quotes from the EIR or
responses to our NOP comments).

2-4 | I read through the entire EIR and most appendices. It
thoroughly describes the impacts – easy to read and
understand – one of the best I have ever read. We
appreciate the responses to our NOP comments and
the analysis of and focus on the impacts and issues
affecting Lucerne Valley. (However I got seasick
scrolling back and forth among the gazillion pages).

FINDINGS:

2-4 The comment praises the content of the DPEIR and conveys appreciation for responses to the LVEDA's NOP comments and the focus in the DPEIR on the impacts and issues affecting Lucerne Valley. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

We agree with the “significant and unavoidable” findings:

Loss of loss of Prime Farmland and Farmland of Statewide Importance

Reduced discharge to LV Site, as a result of the Program, has the potential to contribute to water quality degradation in the Lucerne Valley Basin by removing a dilution source,

2-5

Potential to reduce the groundwater recharge of the Lucerne Valley Basin due to the reduction in discharge to the LV Site, thereby resulting in a significant and unavoidable impact.

Reduction in discharge to the LV Site has the potential to impact the amount of water expected to be recharged to the Lucerne Valley Basin on an annual basis, thereby impacting water supplies for users of the Lucerne Valley Basin.

FIELD RESTORATION:

2-6

We appreciate BBARWA’s commitment to enhance the “maintenance/stabilization/restoration” of the fallowed

- 2-5 The comment concurs with the significant and unavoidable impact findings in the DPEIR, including: Loss of prime farmland and farmland of statewide importance; reduced discharge to the Lucerne Valley Site (LV Site) could contribute to degradation of the Lucerne Valley Basin by removing a dilution source; reduction in discharges to the LV Site could significantly impact the groundwater recharge of the Lucerne Valley Basin; and, reduction in discharges to the LV Site could significantly impact water supply. BBARWA adds that it considered utilizing agricultural conservation easements to mitigate the significant loss of farmland identified in the DPEIR. Since there are no other feasible mitigation measures, utilization of an agricultural easement would not be able to fully mitigate the impact to a level of less than significant. Thus, this concept was deemed infeasible because it would neither fully reduce the significant impact to a level of less than significant, nor would it be logical to consider payment towards or creation of offsite agricultural conservation easements in this instance. This is because the Program would not eliminate the future potential for this land to return to agricultural production, but based on water availability at the LV Site, the continuation of farming 190-acres would likely be infeasible. Thus, the employment of offsite agricultural conservation easements was deemed impractical, and furthermore, would not fully offset significant agricultural impacts. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 2-6 The comment requests that LV Site field maintenance/stabilization/restoration begin in the very near term future. BBARWA appreciates the comment, and will take the comment into consideration when planning for the future of the LV Site. Early consultation with the Mojave Desert Resource Conservation District (MDRCD) and USDA's Natural Resource Conservation Service (NRCS) will be conducted once a plan for maintenance/stabilization/restoration takes shape.

2-6
cont'd

fields. We are prepared to assist via the Mojave Desert Resource Conservation District (MDRCD) and USDA's Natural Resource Conservation Service (NRCS). We request that this process begin soon before wastewater is withdrawn in order to provide the irrigation necessary for said work – at least on the portion of the fields not used for the current farming. Restoration of desert ground is difficult, labor intensive and of course takes years to even get partial reclamation done – even with irrigation.

2-7

2-8

We strongly support: *In the event that continued maintenance and enhanced site maintenance do not fully address the potential for fugitive dust migration to occur at the site as a result of the change in discharge operations to the LV Site from implementation of the Program, a violation of Mojave Desert Air Quality Management District (MDAQMD) Rule 403 Rule 403.2, Fugitive Dust Control for the Mojave Desert Planning Area, could occur thereby resulting in a potentially significant air quality impact. Thus, a fugitive dust response program shall be implemented by BBARWA.*

WINTER FLOWS:

- 2-7 The comment notes that restoration of desert ground is difficult and labor intensive, as well as time consuming. As stated under Response to Comment 2-6, early consultation with the MDRCD and NRCS will be conducted once a plan for maintenance/stabilization/restoration takes shape.
- 2-8 The comment conveys support for the implementation of a fugitive dust response program at the LV Site, implemented through **MM AQ-2**. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

2-9

The best use of the (@340AFY) winter-time wastewater might be direct flow into the recharge ponds rather than the attempt to use it for grain crop irrigation. That could partially alleviate our loss of inflow/Physical Safe Yield (PSY) – assuming of course that recharge from BBARWA’s ponds reaches the middle groundwater aquifer – not just remain in the mostly unused upper aquifer. Plus trying to farm a crop in the winter not knowing the quantity or timing of water delivery can be difficult and unproductive.

RECHARGE/WATER BALANCE:

it is assumed that the actual amount of water recharged to the Lucerne Valley Basin is less than the amount assumed by the MBA Watermaster, at 1,610 AFY.

2-10

The EIR’s Water Balance and estimates of groundwater recharge from BBARWA’s effluent will be helpful to the MWA/Watermaster in determining/estimating the amount of inflow/PSY that will be lost - thereby reducing our PSY and consequently affecting the eventual amount of FPA that the Watermaster Court

- 2-9 The comment suggests that the best use of the reduced discharge to the LV Site under the Program may be to flow into recharge ponds rather than utilize the discharge for crop irrigation as this could partially alleviate the loss of inflow/PSY that the DPEIR acknowledges may occur as a result of Replenish Big Bear Program implementation. BBARWA maintains that it is open to “working with the MBA Watermaster¹ and MWA to find an alternative use for the excess secondary effluent discharged to the LV Site, should there be a desire to do so” (DPEIR page 4-674). Otherwise, BBARWA intends to seek a modification to its existing WDR discharge permit for the LV Site, which will incorporate the change in operation due to reduced flows, and BBARWA intends to maintain the existing ability to dispose of excess secondary effluent to its two disposal ponds on the LV Site.
- 2-10 The comment conveys that the water balance and estimate of groundwater recharge to the Lucerne Valley Basin presented in the DPEIR will be helpful to the MBA Watermaster in determining the eventual amount of Free Production Allowance that Lucerne Valley water users will be subject to as a result of the reduction in discharge to the LV Site. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

¹ Mojave Basin Area (MBA) Watermaster

2-11 could eliminate. (I personally think that the amount of actual recharge to groundwater from crop irrigation alone was overestimated due to inefficient wheel line spray irrigation – evaporation - wind and climate conditions – water uptake from deep alfalfa roots – clay lenses keeping water from infiltrating into the middle aquifer -etc. However I can't legitimately argue that point without being accused of “practicing hydrology without a license”).

NITRATES:

In 2016, the Colorado Regional Board requested for BBARWA to complete an analysis to assess changes in groundwater quality beneath the LV Site since BBARWA began collecting groundwater quality data in 1991.

2-12 *Data regarding nitrate concentrations in groundwater in the vicinity of the Lucerne Valley was not available for the period prior to 1980 when the facility began operation. The earliest available data, from 1991 through 1998, show nitrate concentrations in groundwater in the Lucerne Valley to be less than 2 mg/L (SWRCB, 2017). TDS and nitrate concentrations*

- 2-11 The comment conveys a personal opinion that the actual amount of recharge to the Lucerne Valley Basin is less than what was forecast in the DPEIR, but notes that, without a background in hydrology, such a claim remains a personal opinion. BBARWA acknowledges that the water balance presented in the DPEIR is likely a conservative estimate of the amount of water recharged to the Lucerne Valley Basin as a result of the reduction in discharge to the LV Site. The DPEIR utilizes the best available data to forecast environmental impacts consistent with CEQA, and as such BBARWA maintains that the actual recharge may be less than that which is forecast in the DPEIR.
- 2-12 The comment quotes directly from the DPEIR, and therefore does not require further response.

2-12
cont'd

in BBARWA effluent sent to the LV Site have historically been lower than the TDS and nitrate concentrations detected in samples from the downgradient monitoring wells at the LV Site (MW-2 and MW-3).

2-13

Exh. 4-624 shows BBARWA's nitrate levels from 1990 on. Wastewater flow to Lucerne Valley started around 1980. (Wastewater nitrate levels from 1980 to 1990 might have been cited in the EIR but I didn't see it).

2-14

QUESTION: What were BBARWA's wastewater nitrate levels from 1980 to 1990? Was there any denitrification during that period?

2-15

High nitrate levels are showing up close to and downstream from BBARWA's facility. 20-25 years ago Mitsubishi Cement lost Well #7 due to high nitrates. It lost Well #9 in mid-2019 due to nitrates. I have heard statements like: "Mitsubishi's "Carter Ranch" wells just northwest and downstream of BBARWA's recharge 'were clean' before BBARWA". Both Bar H MWC along Medanos Rd. just to the northwest – and possibly Gordon Acres(?) to the northeast are under Compliance Orders due to high nitrates.

- 2-13 The comment reflects the content of the Exhibit shown on page 4-264 of the DPEIR, and therefore does not require further response.
- 2-14 The comment asks whether nitrate levels were recorded between 1980 and 1990, and whether denitrification occurred during this period. In 1997 and 1998, BBARWA completed several studies to evaluate the sources of nutrients at the LV Site (the Report containing these findings is provided as **Appendix 1** to these Responses to Comments). Exhibit 8 of the Evaluation of Nitrogen Sources and Effects Apr 1, 1997 Phase I report included effluent data from the BBARWA plant. Based on this exhibit, between 1980 and 1990, the average BBARWA effluent nitrate concentration as N was 11.63 mg/L. The minimum and maximum concentrations were 0.44 and 24.8 mg/L as N, respectively. Thus, data shows that a range of complete, partial, and limited denitrification occurred during that time period.
- 2-15 The comment conveys anecdotal observations on the source of high nitrates in the Lucerne Valley Basin in the vicinity of the LV Site, and potentially attributing the high sources of nitrate to BBARWA. Based on Appendix C17 of the Mojave Salt and Nutrient Management Plan (SNMP) (**Appendix 2** to these Responses to Comments), the key loading factor for nitrate-NO₃ in the Lucerne Valley South subbasin, where the BBARWA discharge is located, is agricultural irrigation return (46%), septic tank return (30%) and imported BBARWA WWTP effluent (22%). Although the BBARWA discharge does add some nitrate, it is not the largest source, as discussed in the DPEIR and SNMP. Refer to the expanded discussion of this topic on Response to Comment 2-16, below.

-

2-16

QUESTION: If wastewater nitrate levels were higher before 1990 – and it takes X years for subsurface flows to move downstream – could BBARWA’s pre 1990 nitrate levels account for nitrates detected in the on-site monitoring wells – in Mitsubishi’s - and in the other wells? (Mitsubishi’s wells along and just west of Camprock Rd. aren’t near septic systems – but the other locations could be so affected. Not sure how to account for nitrates/TDS in monitoring wells upstream from the BBARWA facility where few if any septic systems occur).

Since BBARWA’s wastewater is not included in the LV Basin’s annual yield calculation or claim to that supply.....

2-17

QUESTION: I don’t understand this statement especially since it is acknowledged elsewhere that the discharge IS accounted for in our PSY. Or is that statement referencing something different?

2-18

QUESTION: At project implementation – in a worst-case, emergency scenario - if something fails at the treatment plant or it can’t handle all the wastewater to

2-18 | be treated – can BBARWA’s reservoir and recharge
cont’d | ponds in Lucerne Valley accommodate it?

- 2-16 The commenter asks if BBARWA's pre-1990 nitrate levels account for the current detected nitrate levels in the onsite monitoring wells, and in other area monitoring wells. As discussed above in the Response to Comment 2-15 and in the DPEIR on pages 4-663 to 4-666, as outlined in the Groundwater Quality Evaluation at the Lucerne Valley Land Discharge Location prepared by Thomas Harder & Co (**Appendix 6** to the DPEIR), total dissolved solids (TDS) and nitrate concentrations in BBARWA effluent sent to the LV Site have historically been lower than the TDS and nitrate concentrations detected in samples from the downgradient monitoring wells at the LV Site (monitoring well [MW]-2 and MW-3) and the upgradient monitoring well (MW-1). The comment raises questions about the historical nitrate levels prior to 1990, which has no bearing on the determinations made in the DPEIR regarding the impacts related to water quality from reducing BBARWA's discharge to the LV Site as a result of implementation of the proposed Program. The DPEIR measured the above impacts utilizing the average historical nitrate levels of BBARWA's effluent discharge to the LV Site (refer to **Table 4.11-14** of the DPEIR, page 4-665), and determined that, *"as the BBARWA effluent is of better quality for nitrate and TDS than the downgradient groundwater, the continued discharge would not degrade the water quality of the Lucerne Valley Basin. However, because the BBARWA effluent is of better quality than the downgradient groundwater for nitrate and TDS, it may be currently acting as a minor source of dilution"* (DPEIR 4-665).
- 2-17 The comment questions the meaning of the DPEIR quote: "Since BBARWA's wastewater is not included in the LV Basin's annual yield calculation or claim to that supply . . ." This is in reference to BBARWA's wastewater flow into the LV Basin. BBARWA's wastewater flow to the LV Site is not considered an adjudication water right or claim to the LV Site, but only considered to be an accounting for that supply (**Appendix 23** to the DPEIR). Since BBARWA's wastewater is not included in the LV Basin's annual yield calculation or claim to that supply, BBARWA is not bound by the LV Basin's adjudication and its wastewater can be diverted to be reused in Big Bear Valley at BBARWA's discretion. (**Appendix 24** to the DPEIR).
- 2-18 The comment asks whether BBARWA's LV Site can handle the effluent discharge if there were to be a failure of the new advanced water purification facility (AWPF) at the BBARWA WWTP. BBARWA intends to preserve its existing permit to discharge to the LV Site, which will allow BBARWA to continue discharging undisinfected secondary water to the LV Site as it does under the current operation, including flows that cannot be treated by the AWPF during emergencies.

Subject: Replenish Big Bear: DPEIR Available for Public Comment from 12/21/23 to 2/5/24

Caution: This email originated from outside EPA, please exercise additional caution when deciding whether to open attachments or click on provided links.

Good Morning All,

BBARWA posted the DPEIR for public comment this morning on their website. Please visit this page to access the report: <https://www.replenishbigbear.com/eir-process>

As a reminder, the DPEIR was completed for the entire Replenish Big Bear Program. BBARWA's

WIFIA loan application is to help implement the following components: BBARWA WWTP Upgrades Project, Solar Evaporation Ponds Project, and Stanfield Marsh/Big Bear Lake Discharge Project.

Beth, you mentioned that you were coordinating with the USBR Title XVI and the EPA STAG Environmental teams to complete the federal environmental review. Could you please forward this email to them or send me their contact information so I can send them the DPEIR? For reference, I'm attaching the NOA.

Let me know if you have any questions. Thank you, and Happy Holidays,

Sincerely,

FYI – I will be on vacation from **1/8/24** to **1/26/24** with no access to email or phone. Please coordinate with me for any information you may need in my absence.

Antonia Estevez-Olea

Subject: Technical Data Request: Proposed Replenish Big Bear Program Project

Dear Bridgette Burton,

4-1

South Coast AQMD staff received the Notice of Availability of a Draft Program Environmental Impact Report (NOA/DPEIR) for the **Proposed Replenish Big Bear Program Project** ([South Coast AQMD Control Number: SBC231221-07](#)). Staff is currently in the process of reviewing the NOA/DPEIR. The public commenting period is from 12/21/2023 – 2/5/2024.

4-2

Upon review of the files provided as part of the public review period, I was able to access the DPEIR and Appendices on the [website](#) that was provided in the NOA.

Please provide an electronic copy of any live modeling and emission calculation files (complete files, not summaries) that were used to quantify the air quality impacts from construction and/or operation of the Proposed Project as applicable, including the following:

- CalEEMod Input Files (.csv files);
- Live EMFAC output files;
- Any emission calculation file(s) (live version of excel file(s); no PDF) used to calculate the Project's emission sources (i.e. truck operations);
- Any cancer risk calculation files (live version of excel file(s); no PDF) used to calculate cancer risk, and chronic and acute hazards from the Project.

You may send the above-mentioned files via a Dropbox link in which they may be accessed and downloaded by South Coast AQMD staff by **1/9/24**. Without all files and supporting documentation, South Coast AQMD staff will be unable to complete a review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.

If you have any questions regarding this request, please contact me.

Thank you,

Evelyn Aguilar

Draft Program Environmental Impact Report (PEIR) for the Replenish Big Bear Program Project (Proposed Project)

4-5

The South Coast Air Quality Management District (South Coast AQMD) appreciates the opportunity to review the above-mentioned document. The Big Bear Area Regional Wastewater Agency (BBARWA) is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. To provide context, South Coast AQMD staff has provided a brief summary of the project information and prepared the following comments.

South Coast AQMD's Summary of Project Information in the Draft PEIR

4-6

Based on the Draft PEIR, the Proposed Project consists of construction and operation of an advanced water purification facility (AWPF), and associated pipelines and infrastructure, in the Big Bear Valley area of the San Bernardino Mountains of San Bernardino County.¹ Specifically, the aforementioned includes the construction of: 1) approximately 6.59 miles of drinking water and reverse osmosis (RO) pipelines; 2) brine minimization; 3) three pump stations; 4) a groundwater recharge system; and 5) four monitoring wells with a capacity of up to 2,210 acre-feet per year of water from the AWPF.² The AWPF will be co-located at the existing BBARWA Wastewater Treatment Plant (WWTP).³ Upgrades to the WWTP to accommodate the AWPF consist of upgrades to the existing oxidation ditches and the addition of tertiary filtration, ultrafiltration and RO membrane filtration, brine pellet reactor, and ultraviolet advanced oxidation processes.⁴ Construction is anticipated to commence in January 2025 and be completed by January 2027.⁵ The Proposed Project is located roughly east of Big Bear Lake and spans to the BBARWA WWTP.⁶

South Coast AQMD Comments

South Coast AQMD Air Permits and Role as a Responsible Agency

¹ Draft PEIR. Program Description. Pages 3-19 through 3-33.

² *Ibid.* Executive Summary. Page 1-4 & Chapter 3. Page 16.

³ *Ibid.* Chapter 3. Page 14 through 17.

⁴ *Ibid.* Pages 3-51 through 3-59.

⁵ *Ibid.* Appendices. Table 3-2: Construction Duration. PDF Page 877 of 2826.

⁶ *Ibid.* Project Description. Figure 3-29. Page 3-22.

4-5 The comment introduces SCAQMD's review of the DPEIR. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

4-6 The comment summarizes the Program. BBARWA offers a few points of clarification:

- The comment does not include mention of the proposed solar array that will be installed as part of the program, nor does it include mention of the solar evaporation ponds that would be installed as part of the Program.
- Note that the 2,210 AFY capacity is related to the AWPf itself, not the monitoring wells, as monitoring wells do not have a "capacity" in the way that extraction, aquifer storage and recovery, and injection wells have capacities.
- The proposed Program will not install a "groundwater recharge system," instead it will install a pipe outlet at Sand Canyon, and the water released from this outlet is anticipated to recharge naturally.

4-7

If implementation of the Proposed Project would require the use of new stationary and portable sources, including but not limited to emergency generators, fire water pumps, boilers, etc., air permits from South Coast AQMD will be required. The final CEQA document, whether a MND or EIR, should include a discussion about the potentially applicable rules that the Proposed Project needs to comply with. Those rules may include, for example, Rule 201 – Permit to Construct,⁷ Rule 203 – Permit to Operate,⁸ Rule 401 – Visible Emissions,⁹ Rule 402 – Nuisance,¹⁰ Rule 403 – Fugitive Dust,¹¹ Rule 1110.2 – Emissions from Gaseous and Liquid Fueled Engines,¹² Rule 1113 – Architectural Coating,¹³ Rule 1166 – VOC Contaminated Soil Excavation,¹⁴ Rule 1179 – Publicly Owned Treatment Works Operation,¹⁵ Regulation XIII – New Source Review,¹⁶ Rule 1401 – Air Toxics,¹⁷ Rule 1466 – Control of Particulate Emissions from Soils with Toxic Air Contaminants,¹⁸ Rule 1470 – Requirements for Stationary Diesel Fueled Internal Combustion and Other Compression Ignition Engines,¹⁹ etc. It is important to note that when air permits from South Coast AQMD are required, the role of South Coast AQMD would change from a Commenting Agency to a Responsible Agency under CEQA. In addition, if South Coast AQMD is identified as a Responsible Agency, per CEQA Guidelines Sections 15086, the Lead Agency is required to consult with South Coast AQMD.

4-8

CEQA Guidelines Section 15096 sets forth specific procedures for a Responsible Agency, including making a decision on the adequacy of the CEQA document for use as part of the process for conducting a review of the Proposed Project and issuing discretionary approvals. Moreover, it is important to note that if a Responsible Agency determines that a CEQA document is not adequate to rely upon for its discretionary approvals, the Responsible Agency must take further actions listed in CEQA Guideline Section 15096(e), which could have the effect of delaying the implementation of the Proposed Project. In its role as CEQA Responsible Agency, the South Coast AQMD is obligated to ensure that the CEQA document prepared for this Proposed Project contains a sufficient project description and analysis to be relied upon in order to issue any discretionary approvals that may be needed for air permits. South Coast AQMD is concerned that the project analysis in its current form in the Draft PEIR is inadequate to be relied upon for this purpose.

⁸ South Coast AQMD. Rule 203 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-ii/rule-203.pdf>

⁹ South Coast AQMD. Rule 401 available at <https://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-401.pdf>

¹⁰ South Coast AQMD. Rule 402 available at <https://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-402.pdf>

¹¹ South Coast AQMD. Rule 403 available at <https://www.aqmd.gov/docs/default-source/rule-book/rule-iv/rule-403.pdf>

¹² South Coast AQMD. Rule 1110.2 available at https://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1110_2.pdf

¹³ South Coast AQMD. Rule 1113 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xi/r1113.pdf>

¹⁴ South Coast AQMD. Rule 1166 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1166.pdf>

¹⁵ South Coast AQMD. Rule 1179 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xi/rule-1179.pdf>

¹⁶ South Coast AQMD. Regulation XIII available at <https://www.aqmd.gov/home/rules-compliance/rules/scaqmd-rule-book/regulation-xiii>

¹⁷ South Coast AQMD. Rule 1401 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1401.pdf>

¹⁸ South Coast AQMD. Rule 1466 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1466.pdf>

¹⁹ South Coast AQMD. Rule 1470 available at <https://www.aqmd.gov/docs/default-source/rule-book/reg-xiv/rule-1470.pdf>

- 4-7 The comment notes that air permits from SCAQMD may be required to implement the Program, and that these permits should be outlined in the FPEIR. The comment lists the Rules that may apply to the Program, and notes that in the event that air quality permits are required, SCAQMD would be a responsible agency under CEQA. In the event that this is the case, BBARWA and/or the Program Team would be required to consult with SCAQMD. At this time, no new stationary or portable equipment, such as emergency generators, fire water pumps, or boilers, are anticipated to be required. However, as the design progresses, if a need for additional permits is identified, BBARWA will coordinate with SCAQMD to secure the required permits.

As discussed by **MM AQ-2**, in the event that continued maintenance and enhanced site maintenance do not fully address the potential for fugitive dust migration to occur at the site as a result of the change in discharge operations to the LV Site from implementation of the Program, a violation of Mojave Desert Air Quality Management District (MDAQMD) Rule 403.2, Fugitive Dust Control for the Mojave Desert Planning Area, could occur thereby resulting in a potentially significant air quality impact. Thus, a fugitive dust response program shall be implemented by BBARWA.

- 4-8 The comment details the role of SCAQMD as a responsible agency. The comment also notes that if a project analysis is inadequate SCAQMD would require further actions as outlined in CEQA Guideline Section 15096(e), which could delay the Program Implementation. Based on their review of the DPEIR, the SCAQMD is concerned that the project analysis in its current form is inadequate to be relied upon for this purpose for reasons outlined in Comment 4-9. Please refer to Response to Comment 4-9, which addresses the concerns raised in this comment completely.

The project will likely be subject to the following permitting requirements:

1. Modification application to incorporate the BBARWA WWTP Upgrades Project.
2. New construction application(s) for emergency generator(s).
3. New construction application(s) for odor control units, if new odor control equipment are to be constructed at the WWTP and/or pump stations.

4-9 For these reasons, the final CEQA document should be revised to include a discussion about any and all new stationary and portable equipment requiring South Coast AQMD air permits, provide the evaluation of their air quality and greenhouse gas impacts, and identify South Coast AQMD as a Responsible Agency for the Proposed Project as this information will be relied upon as the basis for the permit conditions and emission limits for the air permit(s). Please contact South Coast AQMD’s Engineering and Permitting staff at (909) 396-3385 for questions regarding what types of equipment would require air permits. For more general information on permits, please visit South Coast AQMD’s webpage at <http://www.aqmd.gov/home/permits>.

Conclusion

4-10 As set forth in California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(a-b), the Lead Agency shall evaluate comments from public agencies on the environmental issues and prepare a written response at least 10 days prior to certifying the Final PEIR. As such, please provide South Coast AQMD written responses to all comments contained herein at least 10 days prior to the certification of the Final PEIR. In addition, as provided by CEQA Guidelines Section 15088(c), if the Lead Agency’s position is at variance with recommendations provided in this comment letter, detailed reasons supported by substantial evidence in the record to explain why specific comments and suggestions are not accepted must be provided.

Thank you for the opportunity to provide comments. South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Evelyn Aguilar, Air Quality Specialist, at eaguilar@aqmd.gov should you have any questions.

Sincerely,
Sam Wang
 Sam Wang
 Program Supervisor, CEQA IGR
 Planning, Rule Development & Implementation

SW:PT:EA
SBC231221-07
 Control Number

- 4-9 The comment lists the possible permitting requirements applicable to the Program. Refer to Response to Comment 4-7, in which BBARWA responds that permits related to new stationary or portable equipment are not anticipated. However, as the design progresses, if a need for additional permits is identified, BBARWA will coordinate with SCAQMD to secure the required permits.
- 4-10 The comment cites the law requiring BBARWA to prepare written response to SCAQMD at least 10 days in advance of FPEIR certification. BBARWA has provided written response to SCAQMD and the other commenting entities in accordance with the law, as demonstrated herein through these Responses to Comments. BBARWA will retain the contact information provided in this comment as part of the Program file.

Subject: DPEIR...Replenish Big Bear Project
Date: Friday, January 26, 2024 4:51:21 PM

5-1

I appreciate the opportunity to comment on the DPEIR.

I wish to submit my support for Replenish Big Bear Project.

5-2

I would also suggest that the RQWCB should reconsider the project directive. Instead of requiring the Replenish Big Bear effluent be pumped up and discharged into Sand Canyon, it should be discharged into Stanfield Ponds and thus save the project and local ratepayers millions of dollars in offsite construction costs.

Sincerely,

Joe Cylwik

**RESPONSE TO COMMENT
LETTER #5
JOE CYLWIK**

5-1 The comment conveys support for the Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

5-2 The comment asked for the Regional Water Quality Control Board (RWQCB) to reconsider asking BBARWA to send the Program Water to Sand Canyon as that is more expensive, and instead ask for the Program to be added to the Stanfield Ponds. To clarify, the RWQCB is not requiring BBARWA to send the Program Water to Sand Canyon. The Program components described in the DPEIR were selected after many alternatives were evaluated (refer to Chapter 5 of the DPEIR and **Appendix 20** to the DPEIR) and the Program put forth in the DPEIR was determined to bring the most benefit to the Community of Big Bear. Overall, the Program objectives, the Program includes the following uses and benefits:

- **Sustain Stanfield Marsh Habitat and Increase Educational Opportunities:** By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained and educational opportunities for the community and visitors would be created;
- **Enhance Big Bear Lake Benefits:** The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- **Expand Local Water Supplies:** When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin. The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge;
- **Sustain Unarmored Threespine Stickleback Fish with Program Water:** To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater. While this part of the Program is included in this DPEIR for analysis purposes, this Program component is not anticipated to be completed in the near term. Therefore, a full analysis was not completed;

The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

To whomever it may concern:

I am so happy with the progress of your work with Replenish Big Bear. I think the end result would be extraordinary for many reasons. The obvious, more usable water for growth. The beauty of the lake, and the economic help it will bring to our city.

Also, the ability to enhance the marsh and other areas for a haven, dedicated to birdwatchers and nature lovers.

Thank you so much for your dedication and hard work. Please fulfill your promise and complete this needed process.

Sincerely,
John Johnstone

RE: CEQA – NOTICE OF AVAILABILITY OF A DRAFT PROGRAM EIR FOR PUBLIC REVIEW FOR THE REPLENISH BIG BEAR PROGRAM

Dear Ms. Burton:

9-1 Thank you for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced public hearing notice. **We received this request on December 27, 2023**, and pursuant to our review, the following comments are provided:

Permits Division (Johnny Gayman, Chief, 909-387-7995):

9-2 1. The proposed Replenish Big Bear Program in the City of Big Bear Lake is located adjacent to a San Bernardino County Flood Control facility. The applicant will need to obtain an encroachment permit if they are proposing any work within the San Bernardino County Flood Control District Road Right of Way (FCD R/W). If you have any questions regarding this process, please contact the FCD Permit Section at (909) 387-1863.

9-3 We respectfully request to be included on the circulation list for all project notices, public reviews, or public hearings. In closing, I would like to thank you again for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. Should you have any questions or need additional clarification, please contact the individuals who provided the specific comment, as listed above.

Sincerely,

Nancy Sansonetti

**RESPONSE TO COMMENT
LETTER #9
SAN BERNARDINO COUNTY DEPARTMENT OF PUBLIC WORKS**

- 9-1 The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

- 9-2 The comment notes that an encroachment permit for work within the San Bernardino Flood Control District (SBCFCD) Right of Way (ROW) may be required as a result of the Program's possible location adjacent to SBCFCD facilities. BBARWA and the Program Team will ensure that any encroachment into SBCFCD will be performed in accordance with SBCFCD standards and procedures. If an encroachment permit is necessary, BBARWA or the Program Team implementing agency will ensure a permit is obtained before construction within SBCFCD ROW.

- 9-3 The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program. BBARWA will include the SBCFCD in the circulation list for all future project notices, public reviews, and public hearings.

Comment Letter #10

From: [Jim Sperling](#)
To: [Bridgette Burton](#)
Subject: DPEIR...Replenish Big Bear Project
Date: Thursday, February 1, 2024 9:10:30 AM

Thank you for the opportunity to comment on the DPEIR.

10-1

I would like to express my support for Replenish Big Bear Project. This could be the best improvement project to support the Big Bear Community in our History!

10-2

Talking with my friend Joe Cylwik, I agree with his thought that the RQWCB should reconsider the project directive to have the effluent pumped into the Stanfield Ponds (vs. discharged into Sand Canyon) to save ratepayers Millions of \$\$ in offsite construction costs. With the State requiring this project to treat the wastewater to the maximum cleanliness level, why not just discharge into the Stanfield Ponds? Much

10-3

less costly and the lake can further benefit by the higher level as well as the potential overflow at the dam for water uses below.

Sincerely,

James Sperling
39225 Seminole Drive
P.O. Box 482

Subject: Replenish Big Bear!
Date: Tuesday, February 6, 2024 11:36:42 AM

Dear Bridgette Burton,

12-1 | Thank you for the chance to comment on the "Replenish Big Bear" project. This is a very sought after and valuable effort that needs to happen! Big Bear Lake's water levels need to be continually restored to help the residents, visitors, and wildlife alike. I look forward to hearing more about this project and seeing it's completion in the coming years.

Thank you,

Doug Sperling

Comment Letter #13

Big Bear Group

San Gorgonio Chapter

PO Box 3048 Big Bear Lake CA. 92315

13-1

The Big Bear Group of the Sierra Club representing approximately 150 members in the Big Bear Valley and 6500 members in the San Gorgonio Chapter has the following comments on the Replenish Big Bear Program being proposed by the Big Bear Area Regional Wastewater Agency.

13-2

California has historically been plagued by water problems. The cycle of flooding and drought dates back thousands of years. As a result, the state has developed a transportation and storage system that is among the best in the world. Unfortunately, the Big Bear Valley is not connected to this system and most likely never will be. The water we are able to extract from our aquifer is all we are going to get. The effects of climate change may decrease the amounts of water the valley receives from rain and snow and thus limit the water available for aquifer recharge. The water we extract from our aquifers is a valuable commodity and must be treated as such. If we are to continue to thrive, projects like Replenish Big Bear are necessary. However, our membership has the following concerns that must be addressed in order for them to be comfortable with this program.

**RESPONSE TO COMMENT
LETTER #13
SIERRA CLUB BIG BEAR GROUP**

- 13-1 The comment describes the Big Bear Group of the Sierra Club. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

- 13-2 The comment outlines the opinion of the Sierra Club Big Bear Group on the existing setting pertaining to water availability in the State of California. The comment also offers that the Replenish Big Bear Program is a necessary Program for the Big Bear Valley, but conveys that the comment letter will outline the Sierra Club Big Bear Group's concerns with the Program and DPEIR.

- **Pharmaceuticals and personal care products in the water piped to Sand Canyon for recharge and water going to Shay Pond the Stanfield Marsh.**

13-3

What if any of these contaminants do you expect in the product stream after being treated with UF, RO and UV/AOP? It is our understanding that these

13-4

processes have been used in other sewage treatment facilities in southern California. What has been their experiences, and does it align with the finding from

13-5

China that you reference in the appendices of the DEIR? If there are minute amounts in the product

13-6

stream has the scientific community deemed them of no consequence? We would believe that with the State Water Resources Control Board recently

13-7

approving regulations for converting wastewater to drinking water that this must have been addressed by their scientists. What were their findings?

13-8

Information from local sources would be better accepted than an article referencing an experience in China that was pulled off the internet.

- **Adverse effects on wildlife getting into the potentially toxic evaporation ponds.**

13-9

The primary problem is waterfowl. BIO-29 suggests that the deterrents will be tarps or screens placed

- 13-3 The comment asks whether any contaminants related to pharmaceuticals and personal care products (PPCP) are expected to be present in the Program Water. Because PPCPs are contaminants of emerging concern (CECs), many individual contaminants are not yet regulated, and laboratory tests are not yet available to test for all of the contaminants at very low concentrations. However, the science and regulations for PPCPs are continually evolving.

Currently, the State of California has adopted regulations to protect public health and the environment by setting specific requirements for indirect potable reuse projects (IPR), like the Replenish Big Bear Program, that can be used to protect the Big Bear Valley Community. In order for an IPR project to be permitted, it must meet very stringent treatment, monitoring, reporting, and response action requirements. For example, a groundwater replenishment project that seeks to inject recycled water directly into a groundwater basin must treat its water using full advanced treatment, which was deemed by the regulators to be sufficient to protect public health. BBARWA is proposing to produce Program Water through full advanced treatment via a new advanced water purification facility (AWPF), so although the Program is not a direct groundwater recharge project because the Program Water will be discharged into Stanfield Marsh, BBARWA will employ the same advanced treatment steps as a groundwater replenishment project.

Per Title 22 regulations (§60320.201 (d)) for groundwater replenishment projects using full advanced treatment, 1,4-dioxane is used as a surrogate for chemicals that can be oxidized, like PPCPs. Therefore, by demonstrating that 1,4-dioxane can be broken down, it can also be inferred that PPCPs can also be oxidized by the UV/AOP process and will be broken down. In general, the UV/AOP system uses free radicals to break down PPCPs into non-toxic and small-molecule compounds. As part of the Pilot Study, BBARWA tested 15 samples of the purified water for 1,4 dioxane and this constituent was not detected in any of the 15 samples. A non-detect (ND) result means that the chemical analyzed is not present in the sample at a high enough level for the laboratory equipment to detect. For 1,4-dioxane, the lowest concentration that the laboratory test equipment can detect it at is 0.023 µg/L.

- 13-4 The comment notes that Ultrafiltration (UF), Reverse Osmosis (RO), and UV/AOP technologies are not unique to the Replenish Big Bear Program, and this statement is correct. These technologies are used throughout the water treatment and wastewater treatment industries. Currently, there are 11 permitted groundwater replenishment projects and one surface augmentation project that use similar technologies. About 40 additional planned projects will also use similar treatment processes. A map of these projects is shown here:

<https://watereuse.org/sections/watereuse-california/potable-reuse-map-of-california/>

The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

- 13-5 The comment asks whether UF, RO, and UV/AOP technologies implemented by the Program is anticipated to align with the findings of the “China” reference in the DPEIR. Please refer to the discussion under Response to Comment 13-3, above. The State of California has adopted regulations to regulate water reuse and protect public health. These regulations require project proponents to comply with treatment, monitoring, reporting, and response action requirements to protect public health.

- 13-6 The comment asks whether the science community has weighed in on the potential consequences of any CECs or PPCPs that may remain in advanced treated water generated by treatment systems similar to those proposed by this Program. As stated in response 13-3, not much information is available on CECs or PPCPs, including safety levels or testing methods. Therefore, the use of surrogate parameters to safeguard against groups of constituents like CECs is accomplished by monitoring and regulating surrogate chemicals. The State of California has established water quality limits for many chemicals to protect public health and the environment. The most stringent limits are used when issuing permits to operate facilities. If a limit is violated, regulators will ask the permittee to address the violations within specified time limits. Refer to Response to Comment 19-6 for additional information on water quality.
- 13-7 The comment conveys that the State Water Resources Control Board must be utilizing science in developing regulations for operating facilities such as that which is proposed under this Program. This comment does not pertain to the CEQA process, and therefore does not require a response. However, BBARWA points the commenter to this document, which outlines the steps the State Water Board took to evaluate, develop, and adopt the direct potable reuse regulations:
https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/docs/rulemaking/dpr_draft_isor.pdf
- 13-8 The comment requests the findings of a “local” study pertaining to the safety of the water generated by facilities such as that which is proposed under this Program. As stated under Response to Comment 13-7, this comment does not pertain to the CEQA process, and therefore does not require a response. Refer to the linked document in Response to Comment 13-7, which provides the requested findings.
- 13-9 The comment conveys concern over the use of tarps and/or screens on the Solar Evaporation Ponds to block bird access. Further response to this concern can be found under Responses to Comments 13-10 and 13-11.

13-10 | over the ponds which will block their access. We question the viability of this plan. It would seem that a tarp would block the evaporation process and a screen would potentially snare birds that land on it.

13-11 | Has this method been used at any facility that you can reference? Was it successful? What maintenance problems did they encounter? Are there alternatives?

- **Contamination of aquifer beneath evaporation ponds**

13-12 | The DEIR recognizes the importance of maintaining an impervious barrier of a synthetic material lining the evaporation ponds to prevent the percolation into the underlying aquifer. How is this barrier protected from damage during removal operations of the brine solids? Can you point to projects that have used a liner in this way? How often does the liner need to be replaced?

13-13 |

- **Potential effect on stickleback fish in Shey Pond.**

13-14 | We question the prudence of replacing the present source of water for Shey Pond with water from the RO process. **BIO-6** reflects that concern and the

- 13-10 The comment conveys concern over the use of tarps and/or screens on the Solar Evaporation Ponds to block bird access because it could potentially snare birds that land on the tarps/screens. The comment also questions if the use of tarps would block the evaporation process. The use of tarps may impede the evaporation process for the brine; however, the determination of the appropriate use of bird deterrents—utilization of either tarps or screens—will be made as part of the final design and engineering process. Only materials that would not hinder the efficacy of brine evaporation would be utilized. The ponds will be monitored as part of BBARWA's normal operational procedure for any potential bird activity. Bird netting is utilized in agricultural practices, industrial structures to prevent bird entry, and other applications. There are a number of products² that can be utilized that are designed to control bird access while also minimizing the potential for any impacts to birds.
- 13-11 The comment conveys concern over the use of tarps and/or screens on the Solar Evaporation Ponds and asks if there are other projects that have used these tools, what maintenance problems were encountered, and if there are alternatives. Please refer to Response to Comment 13-10, which describes that use of bird screens is common practice throughout various industries to prevent bird access. BBARWA is open to exploring alternatives, but none have yet been identified that would be equally effective to the use of bird screens, or that would not have potentially significant consequences on birds that utilize the area. For instance, bird deterrents such as bird cannons, bird bombs, and whistler pyrotechnics could be utilized, but these deterrents are disruptive, and as such, a more passive bird deterrent—netting/screens—was preliminarily selected for use by this project.
- 13-12 The comment acknowledges that the DPEIR recognizes the importance of utilizing liners in support of the Solar Evaporation Ponds. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 13-13 The comment asks several questions pertaining to the maintenance and efficacy of the Solar Evaporation Pond liners. The commenter asked if there are any projects that use liners, and how often these are replaced and protected from damage during cleaning operations. Currently, there are few permitted brine ponds, as most projects that use RO technologies discharge their brine into the ocean.

Brine evaporation ponds are typically designed with an impermeable liner system (composed of one or more flexible geomembrane liners and/or clay layers) and an independent leak detection and removal system (LDRS). If a leak is detected, then the liner system needs to be inspected and, if needed, repaired or replaced.

The brine solids will accumulate in the ponds very slowly, and removal of brine solids from the ponds is not expected to be needed until approximately 100 years after operation begins. The ponds themselves are likely to have exceeded their useful life and need to be replaced before the brine solids would have to be removed. Therefore, there are limited to no maintenance activities expected to occur within the ponds that would risk damage to the liner. If damage were to occur, it would be repaired, as noted above.

TIN means the sum of nitrite-nitrogen, nitrate-nitrogen and ammonia-nitrogen.

13-14 The comment conveys concern related to the replacement of water source for the Stickleback at Shay Pond. As stated in the DPEIR on page 1-11 when introducing the Shay Pond Discharge Project, it should be noted that *“while this part of the Program is included in this DPEIR for analysis purposes, the Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (Gasterosteus aculeatus williamsoni), which is a Federally and state endangered species.”* The DPEIR itself acknowledges the challenges related to implementing the Shay Pond Discharge Project, and in fact, as a result of **MM BIO-6**, if this Project was to go forward in the future, CDFW and USFWS must first approve the adaptive management and mitigation plan (AMMP) in order to carry out the pilot study that would determine whether the change in water sources is feasible. In short, the Shay Pond Discharge Project would not go forward without CDFW and USFWS concurrence, and furthermore, without a successful pilot study proving that the change in water source is feasible. While BBARWA appreciates the concern over the feasibility of this Program component, BBARWA does not plan to withdraw its inclusion in the FPEIR because of the protections set forth therein that would ensure the viability of this Program component prior to its implementation, should the Program Team consider its implementation in the future.

13-14
cont'd

complications that such a change would entail. When you add the possibility of needing to construct a new pipeline from the treatment facility, we believe this part of the project should be deleted from consideration.

13-15

We would like to thank the Big Bear Area Regional Wastewater Agency for extending the review period for this lengthy document. It is our hope that all of the concerns expressed by our members can be resolved and that water produced from Big Bear aquifers will stay in the Big Bear Valley.

Sincerely

Ed Wallace

Environmental Chair – Big Bear Group Sierra Club

www.sierraclub.org/san-gorgonio/bigbear

13-15 The commenter thanks the Program Team for extending the commenting period. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

Comment Letter #14

From: [Steve Ludecke](#)
To: [Bridgette Burton](#)
Subject: Comment to Draft PEIR for replenish project.
Date: Sunday, February 18, 2024 2:26:44 PM

Ms. Burton,

14-1 First of all, my wife and I would like to thank you for all of your hard work in advancing the Replenish project and for making the time to field comments and questions from the public.

14-2 We believe that the project carries a great amount of value for the future water needs of our valley. However, there is one portion of the project that we feel would be a great detriment to the neighborhood. That being the addition of a solar field on the property that is currently owned by the BBCCSD directly to the south of BBARWA'S main office building. While we understand that green or inexpensive electricity may be crucial for the success of the project, we feel that the impact to the neighbors would far outweigh the benefit to the project. The negative impacts would include but are not limited to, visual pollution, native species and wildlife impact, and the negative impact to our property values. We currently would put a value on our home at 116 Palomino Drive right around the \$1 million dollar range with a large part of our value due to vast open spaces, views, and enjoying the local wildlife. We feel that the addition of a large-scale solar field would lower our property value significantly and take away our beautiful views and would possibly cause us great financial harm.

14-3 In closing, we wish to express that we are vehemently opposed to the location of the proposed solar field directly to the south of your main office building.

Thank you for your consideration in this matter.

Steve and Kathy Ludecke

(909)709-8619 (cell)
sludecke@hotmail.com
CSLB License # 860384

**RESPONSE TO COMMENT
LETTER #14
STEVE LUDECKE**

- 14-1 The commenter thanks the Program Team for moving the Program forward, and expresses the value in the Program in serving the future water needs of the Big Bear Valley. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 14-2 The commenter expresses opposition to the installation of the Solar Array just south of the BBARWA administration building, citing “negative impacts...to, visual pollution, native species and wildlife impact, and...property values.” CEQA does not require an evaluation of economic considerations such as negative impacts on property values, unless such a regulation has been included in the applicable jurisdiction’s General Plan. In this instance, the San Bernardino Countywide Plan does not reference any goals and policies pertaining to negative impacts on property values, and therefore this issue does not warrant further consideration under CEQA.

The impacts to biological resources have been well documented throughout the DPEIR, and the commenter does not point to a specific concern related to wildlife impacts from the solar array, and as such, BBARWA believes that the evaluation contained in the DPEIR, which considered impacts from installation of the BBARWA WWTP Upgrades, including the proposed Solar Array, remains valid. Furthermore, BBARWA already operates a one million kilowatt (kW) solar array to the west of its WWTP operations, and to date, BBARWA has not observed any negative impacts on wildlife. As the additional solar facilities would be similar in size and scope to the existing solar facilities, there is no evidence to support that the Solar Arrays would pose a threat to wildlife.

Regarding the visual impacts, the area in which the majority of the solar arrays would be installed would be on existing or new building roofs, east of BBARWA’s WWTP plant operations, which is an area that is already highly disturbed by BBARWA’s existing operations, and south of the BBARWA administration building. The area of concern in this comment appears to be the parcel owned by Big Bear City Community Services District (BBCCSD) south of the BBARWA administration building. This parcel is not zoned nor designated by the County’s general plan for open space and furthermore is adjacent to the highly disturbed BBARWA operational site, which does not offer pristine views. The question regarding guarantee of private views is one of the few qualitative environmental issues that the California Supreme Court has addressed. The San Bernardino Countywide Plan and San Bernardino Development Code do not protect private views. Based on this lack of County policy on private views and the State court decisions regarding private views, BBARWA finds that although the adjacent neighbor claims that their views would be degraded by the development of the Solar Array—which in and of itself does not appear to be true given the disturbed nature of the area due to BBARWA’s existing WWTP, administration, and solar array operations—the perception that private views from private residences would constitute a significant impact is not found to be correct as this impact does not rise to a level of a significant unavoidable adverse impact in accordance with CEQA as demonstrated in the preceding analysis.

14-3 The comment expresses opposition to the Solar Array just south of the BBARWA administration building. Refer to Response to Comment 14-2, above. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

Subject: Replenish Big Bear Specific Plan (RBBSP)
SCH # 2022110595

Re: Biological Resources

ATTN: Bridgette Burton, bburton@bbarwa.org
Big Bear Area Regional Wastewater Agency
121 Palomino Drive
P.O. Box 517
Big Bear City, CA 92314

CC: State Clearinghouse—Office of Planning and Research
California Department of Fish and Wildlife
U.S. Fish and Wildlife Service

Dear Ms. Burton:

15-4

Please accept these comments on the Replenish Big Bear Specific Plan (RBBSP) Draft Environmental Impact Report (DEIR). These comments are generally focused on the Biological Impact Assessment section of the DEIR, with general reference to hydrology and related environmental resource assessments of the project, as presented in the Specific Plan.

15-5

First and foremost, I would like to express my general support for the Replenish Big Bear proposal. As a former resident of Big Bear (1978-1989) and past San Bernardino County Planning Commissioner (1983-1988) representing the mountain-area district at the time, I am very familiar with the long history of exportation of municipal wastewater “down the hill” to Lucerne Valley. As the RBBSP points out, Big Bear is situated at the top of the Santa Ana River watershed and is entirely dependent on local precipitation in the form of rain and snow for its municipal water supply. Big Bear and Baldwin Lake, Shay Pond and Creek and all other surface water features are dependent on this local precipitation. Snow making to support the local ski industry derives their water from this same limited resource; not to mention the ecological dependence of Big Bear’s diverse flora and fauna, including bald eagles, unarmored three-spine stickleback fish, and several rare and endangered plant species found nowhere else in the world but the Big Bear area.

Record low water levels in Big Bear Lake in recent years as a result of extreme drought are a clear indication of the vulnerability and dependence of the entire valley on this critical and limited resource—water! So it only makes sense to keep as much of it on the hill as possible. The Replenish Big Bear program, through its proposed state-of-the-technology tertiary treatment technologies, will keep 2,200 acre-feet—more than 700 million gallons—of water on the mountain, helping to maintain groundwater levels for municipal production, as well as sustaining surface water levels in Big Bear Lake, Stanfield Marsh, Shay Pond and other water features in the valley.

- 15-4 The comment conveys the focus of the comment letter: Biological Resources. The comment refers to the Replenish Big Bear Program as a "Specific Plan." It should be noted that the Program is not a Specific Plan, it is a Program with several components detailed specifically in Chapter 1 and 3 of the DPEIR.
- 15-5 The comment expresses general support for the Replenish Big Bear Program, and details the history of the Replenish Big Bear Program along with the existing setting, and the need for the Program to maintain groundwater levels for municipal production. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

15-6 My general response to the RBBSP? It's about time! Let's do this! But let's do it smartly and in such a way that we may optimize municipal water supply while enhancing the benefits of beautiful lakes and creeks and minimize impacts and even improve and restore the habitats of Big Bear's unique flora and fauna. With this basic premise of the Specific Plan and its programmatic implementation, please accept these comments on the potential impacts and mitigation measures of the project on Biological Resources.

Rare and Endangered Plants

15-7 The Big Bear area supports one of the most biodiverse floras in the continental United States (Krantz 1994), with more than a dozen species found nowhere else in the world. Among these are several endemic (restricted) species found only in the wet meadows of Big Bear and Holcomb Valleys. Several of these are obligate wetland species, according to the National Wetland Plant List maintained by the U.S. Army Corps of Engineers—the regulatory agency of the Waters of the United States. (USACE 2024, <https://nwpl.sec.usace.army.mil/>) The indicator species of unique meadow wildflowers is the bird-foot checkerbloom, *Sidalcea pedata*, found only in wet meadows of Big Bear Valley proper—not even in Holcomb Valley or elsewhere in the San Bernardino Mountains. The bird-foot checkerbloom, together with the slender-petalled mustard (*Thelypodium stenopetalum*), California dandelion (*Taraxacum californicum*) and Bear Valley bluegrass (*Poa atropurpurea*), are all Federal- and State-listed as Endangered species associated with wet meadows.

I have been a stalwart advocate and defender of the checkerblooms and other rare plants in Big Bear over my 45 years of professional work as a botanist, environmental consultant, planning commissioner and professor. I dare say that I have developed some notoriety—positive or negative, depending on one's perspective—for standing up for endangered species of Big Bear. The fact that the checkerbloom and the other wetland species are **obligate** wetland plant species means that they only occur in wetlands. They depend on **water!** They depend on this project to keep the water on the hill!

The checkerblooms and other endangered plant species are known to occur on and in the vicinity of the BBARWA and BBCCSD Additional Solar Locations, in the Baldwin Lake Pipeline Alignment Option, and potentially along the East Neighborhoods and Meadow Lane Pipeline Alignment Options.

The DEIR adequately describes the potential impacts on endangered plants and has developed biological mitigation measures to reduce those impacts to the fullest extent possible. Biological mitigation measures BIO-1 to -5 require botanical surveys to be completed prior to construction and avoidance of occupied habitat to the extent possible.

15-8 As a professional botanist—the one who got these species listed as endangered in the first place nearly 40 years ago—I not only support these measures, but I firmly believe that this project offers a unique opportunity to move forward with the project to the benefit of all Big Bear residents, while restoring and conserving the endangered plant species habitats as a legacy project for Big Bear Valley.

- 15-6 The comment once again conveys support for the Program, but notes that the Program could enhance its efforts to minimize impacts to and even improve and restore the habitats of Big Bear's unique flora and fauna. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 15-7 The comment notes that Big Bear supports one of the most biodiverse floras in the continental United States, with several species that occur nowhere else in the world. The comment reiterates that species such as checkerblooms and other endangered plant species may occur in the Program Area of Potential Effect (APE), which is disclosed in the DPEIR.
- 15-8 The comment affirms the potential impacts to endangered plants identified in the DPEIR, and conveys support for MMs **BIO-1 through BIO-5** to minimize impacts thereof. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

East-West Pipeline Alternatives

The RBBSP proposal describes two east-to-west pipeline alternatives to deliver water from the treatment facilities at south Baldwin Lake to Stanfield Marsh and Big Bear Lake—the Baldwin Lake-Meadow Lane Pipeline Option or the East-West Neighborhood Pipeline Option (Fig. 1-10 of the RBBSP). The Baldwin Lake-Meadow Lane Pipeline, which would run across the undeveloped meadows at the southwest end of Baldwin Lake, is much more direct than the Neighborhoods Pipeline alignment, which winds through the streets and neighborhoods of Big Bear City.

The Baldwin Lake Pipeline alignment would run through occupied habitat for the endangered meadow plant species. Biological Mitigation Measures 1-5 (BIO 1-5) require botanical surveys for the endangered meadow species prior to construction and avoidance of them to the extent possible. Regarding the Baldwin Lake pipeline option, BIO MM-5 stipulates:

15-9

Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:

- At least 20 days prior to construction within areas containing the bird-foot checkerbloom, BBARWA shall notify USFWS and CDFW of the construction plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction.
- If neither CDFW nor USFWS opt to collect plants and/or plant seeds, BBARWA shall transplant the plants to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE.

Rather than limit BIO MM-5 to a 20-day notification period, the mitigation measure should proactively call for a restoration plan for the checkerblooms and other rare plant species at southwest Baldwin Lake. There is evidence that transplantation of checkerblooms can be accomplished successfully. Just this past year (2023), working with The Wildlands Conservancy, I oversaw the transplantation of checkerblooms and other native meadow vegetation at the Bluff Lake Reserve in southwest Big Bear Valley, in conjunction with a "rewilding" project to re-establish critically endangered southern mountain yellow-legged frogs and unarmored three-spine stickleback fish. As part of a watershed restoration grant under the direction of the California Department of Fish and Wildlife (CDFW) and U.S. Fish and Wildlife Service (USFWS), 100 checkerblooms were removed from the grading construction area where two earthen berms were to be removed from the meadow. The checkerblooms were watered and maintained in a holding area until grading was completed and then moved back into the graded area after construction, together with 450 plugs of native meadow vegetation as part of the revegetation program. Initial results are very promising, indicating that most of the checkerblooms were vigorous, and some were even flowering several weeks after transplantation.

15-10

A similar methodology could be undertaken along the Baldwin Lake Pipeline route, as well as other areas of the project, such as the Solar Treatment locations, where checkerblooms and other rare plant species are identified during pre-construction surveys. Of course, avoidance

15-11

- 15-9 The comment describes the East-West Pipeline Alternative and requests that **MM BIO-5** be modified to proactively call for a restoration plan for the checkerblooms and other rare plant species that may be impacted by implementation of the Baldwin Lake Pipeline Alignment Option. BBARWA concurs with the concept proposed in this comment, as well as in Comments 15-10 and 15-11. The modification of **MM BIO-5** is discussed further in Responses to Comments 15-10 and 15-11.
- 15-10 The comment describes a project that the commenter undertook that included removing checkerbloom and watering and maintaining the plants in a holding area until grading was completed, and moving the plants back following grading alongside other native vegetation. BBARWA appreciates the commenter's input on how a restoration program for the checkerbloom and other rare plant species could be successful.
- 15-11 The commenter recommends that a similar restoration plan to that which the commenter detailed in Comment 15-10 could be undertaken as part of the Program. BBARWA concurs with the concept proposed in this comment, detailed in Comments 15-9 and 15-10, and appreciates that the commenter has suggested a potential program that could be successful in the commenter's own experience, as there are few examples to draw from in the Valley given the uniqueness of these species to the Valley. BBARWA proposes to modify **MM BIO-5** to incorporate what BBARWA believes is the intent of the recommendation provided in this comment (revisions are shown in underline and strikeout):

BIO-5 *Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:*

- ~~At least 20 days prior to construction within areas containing the bird-foot checkerbloom, BBARWA shall notify USFWS and CDFW of the construction plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction. Due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, and an Incidental Take Permit (ITP) from CDFW shall be obtained.~~
- If neither CDFW nor USFWS opt to collect plants and/or plant seeds Subject to CDFW and USFWS concurrence, with the ultimate mitigation strategy to be approved by CDFW and USFWS prior to implementation, BBARWA shall proceed with the following approach to mitigate impacts to this species:
 - BBARWA shall ~~transplant the plants~~ implement a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either:
 - (a) replanted over the ~~to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or,~~
 - (b) replanted in BBARWA's established conservation area to protect the species in perpetuity.

Furthermore, the above modification to **MM BIO-5** addresses the need for Section 7 consultation as well as Incidental Take Permit obtainment from CDFW, which are

necessary due to the federal nexus for the Program related to the obtainment of grants from the Bureau of Reclamation, United States Environmental Protection Agency (EPA) State and Tribal Assistance Grants (STAG), and EPA Water Infrastructure Finance and Innovation Act of 2014 (WIFIA), as well as grant opportunities being pursued from other federal and/or state agencies. The intent of the above modification is to provide a more broad, experience based potential for the bird-foot checkerbloom species to survive the potentially significant transplant/translocation process that may result from implementation of the Baldwin Lake Pipeline Alignment Option APE. BBARWA believes that, with the above changes to **MM BIO-5**, potential impacts to bird-foot checkerbloom from the implementation of the Baldwin Lake Pipeline Alignment Option, for which a significant and unavoidable impact was identified, will be mitigated to the greatest extent feasible; however, the determination that impacts to this species would be potentially significant and unavoidable remains.

15-11 cont'd is the priority, but if avoidance is not possible, a translocation program may be undertaken in which plants can be moved out of the way of construction, maintained in a holding area and then replanted over the pipeline after construction is completed. The restoration areas can then be secured by conservation easements to ensure long-term preservation of the habitat.

Unarmored Three-spine Stickleback (UTS)

The UTS is a critically endangered fish. The San Bernardino Mountains population was limited to Shay Creek and Baldwin Lake when the lake was full during wet years. During dry years, the fish would find refuge in Shay Creek and the Shay Pond area, where they could survive until the next wet cycle would refill Baldwin Lake. With the installation of the Big Bear City Community Services District (CSD) municipal wells and tanks at the headwaters of Shay Creek in the late 1990s-early 2000s, the creek and lake dried out completely. The BBCCSD committed to maintain the pond as a condition of approval for their municipal water development projects, according to the terms of a Biological Opinion (BO) and agreement between the CSD, the U.S. Forest Service, and the USFWS. (USFWS 2002)

15-12) The terms of the BO require the CSD to acquire and maintain a 2.9-acre parcel of land including the Shay Pond. The Shay Pond parcel was to have been transferred to a “Steward Agency” other than the permittees (the CSD, BBARWA and BBDWP). The San Bernardino Mountains Land Trust took title to approximately 8 acres south and east of the pond, but fee title of the pond itself was retained by the CSD without establishment of a conservation easement or other instrument, in violation of the terms of the BO. Furthermore, the CSD was required to:

“maintain a minimum 20-gallon-per-minute outflow from Shay Pond. The objective is to maintain a minimum pond water level that will support suitable habitat conditions for the fish. Flow measurements are taken at Shay Creek at the culvert outflow on a monthly basis to assure the 20-gallon-per-minute flow is being met. In summer months (mid-July through October) the flow measurement will be conducted at least once every other week.”

15-13 The CSD has not maintained the minimum 20gpm outflow from the pond. The CSD was also required to maintain the fence around the pond to exclude feral burros and livestock grazing. The fence came down during the winter of 2023 and feral burros got into the enclosure, wallowing in the pond and trampling and defecating in the water. The manure and lack of sufficient outflow caused the water to become eutrophic, resulting in death and extirpation of most of the UTS in the pond. This was the last natural habitat for this critically endangered species! Luckily, the CDFW, USFS and USFWS have established a backup population of UTS at another location in the San Bernardino Mountains, or the species would be extinct within the mountain range.

Shay Pond Conveyance Pipeline

15-14 The BO further stipulates, “Should a suitable alternative supply of water be found to be appropriate for the stickleback in the future, CSD may use an ‘in-lieu’ water supply [such as] the

15-12 The comment details the history of protection of the Stickleback in the Big Bear Valley, and cites the requirements of the Biological Opinion between BBCCSD and the USFWS, and USFS. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

15-13 The comment alleges that BBCCSD has not maintained the minimum 20 gallon-per minute (gpm) outflow. The comment also alleges that, due to feral burrows, and lack of fence maintenance, the Stickleback population at Shay Pond has been substantially reduced as a result of eutrophic water. BBCCSD has provided the following context in response to this comment (paraphrased from an email dated February 29, 2024 with Jerry Griffith):

BBCCSD is required to maintain 20 gpm outflow from the pond. The pond was receiving more than enough water because of the above average winter snowfall and runoff, to the point that it was overflowing. BBCCSD recently found that someone blocked the outflow line by damming it up during its most recent clean up, which is why 20 gpm was not exiting the pond. BBCCSD was not able to see the dam that was created because it was underwater.

The fence does get knocked down by the burros from time to time, but BBCCSD has always tried to fix it in a timely manner. BBCCSD checks the pond weekly, sometimes more, and has never observed burros wallowing in the pond or defecating directly in the pond.

Furthermore, BBCCSD's Glenn Jacklin reports that photographic evidence of at least 1 UTS from October 23, 2023 is available. He also reported that CDFW's William Sherwin concluded that UTS were migrating back upstream to the pond and that no local extinction occurred. The above response from BBCCSD to this comment provides additional context that, while the 20 gpm outflow was not maintained for a short period of time, it was due to a manmade blockage that BBCCSD recently remedied. Further, it would appear that BBCCSD has maintained the pond area, and does so on a frequent basis. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

15-14 The comment further details the BO pertaining to the Stickleback, and states that the Shay Pond Conveyance Pipeline should be implemented in conjunction with CDFW, USFWS, and the San Bernardino Mountains Land Trust (SBMLT) to meet BBCCSD's existing requirements under the terms of the BO and as mitigation for the Replenish Big Bear Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

In regards to the BBCCSD meeting existing requirements under the terms of the BO, as this is an existing requirement, the enforcement of this requirement remains under the purview of USFWS and the USFS. In regards to implementation of the Shay Pond Discharge Project as part of the Replenish Big Bear Program, **MM BIO-6** requires consultation with CDFW and USFWS; it states, "*The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.*" The involvement of the SBMLT would be at the discretion of BBARWA and BBCCSD, as the involvement of SBMLT is not necessary to avoid a significant impact under CEQA to the Stickleback. BBARWA and BBCCSD will consider the involvement of SBMLT once this project is defined at concrete level.

15-14 use of tertiary-treated water...” The RBBSP calls for construction of the Shay Pond Conveyance Pipeline to deliver project water from the Treatment Plant to the pond, thereby enabling the CSD to use treated water in lieu of municipal water. As per the conditions of the BO, the replacement of 20gpm of flows from Shay Pond with tertiary treated water would equate to a savings of 32afy (acre feet per year), or 10,512,000 gallons of water saved annually.

cont'd

15-15 Installation of the Shay Creek Conveyance Pipeline should be implemented in conjunction with the CDFW, USFWS, and the San Bernardino Mountains Land Trust (SBMLT) to establish a UTS mitigation area to meet the CSD’s requirements under the terms of the BO, but also as mitigation for the RBBSP, as its project components may pose direct and indirect impacts to this critically endangered species. Furthermore, the area around the Shay Pond parcels, altogether comprising approximately 15 acres of land already owned by the CSD, SBMLT and State, should be fenced to exclude the burros and other livestock. Once fenced and protected, the Shay Pond Conservation Area could also serve as a mitigation and restoration area to offset other impacts on endangered plant habitats, as discussed above.

Conclusions

15-16 The Baldwin Lake Pipeline Alignment option and the Shay Pond Conveyance Pipeline will both require mitigation and establishment of restoration projects for endangered plants and fish. However, by working proactively with the regulatory agencies and conservation organizations, both projects may result in long-term benefits to the species involved, while providing substantial improvements for municipal water supplies and supplemental inflows to sustain Stanfield Marsh and Big Bear Lake.

15-17 These large-scale watershed restoration projects will require obtaining Safe Harbor Agreements between the regulatory agencies and the project Implementing Agencies. Using the Bluff Lake Reserve Habitat Restoration Project as a precedent and model, these RBBSP projects may be fully permitted, constructed and completed in a timely manner as the water treatment programs come online.

15-18 In my 45 years of professional experience working with environmental planning in the Big Bear area, the Replenish Big Bear Specific Plan represents one of the most significant beneficial developments—for plants, animals and people—that I have ever had the opportunity to review. If you have any further questions in these regards, please do not hesitate to contact me at the numbers/email below.

Sincerely,

Dr. Timothy Krantz
Professor Emeritus, Environmental Studies Program
University of Redlands
1200 E. Colton Avenue, Lewis Hall 121

- 15-15 The comment suggests that, once fenced, the Shay Pond Conservation Area could serve as a mitigation and restoration area to offset other impacts on endangered plants. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program. As stipulated by **MMs BIO-7 and BIO-26**, compensatory mitigation for impacts to special status species shall be negotiated between the regulatory agency (CDFW or USFWS, in this case) and the implementing agency. BBARWA and the Program Team shall take the suggestion that, once fenced, the Shay Pond Conservation Area could serve as a mitigation and restoration should the need arise as a result of future pre-construction surveys. BBARWA considers the provisions of the existing mitigation measures, as modified by these Responses to Comments, to be sufficient to protect biological resources within the determinations made in the DPEIR.
- 15-16 The comment reiterates that the Baldwin Lake Pipeline Alignment Option and Shay Pond Discharge Projects will require mitigation, but that in working collaboratively with regulatory agencies, the projects may result in long-term benefits to the species impacted. BBARWA appreciates this and the other comments provided in this comment letter and believes that throughout these Responses to Comments, BBARWA has demonstrated its commitment to protecting sensitive species as part of the Program.
- 15-17 The comment notes that the Program will require obtaining Safe Harbor Agreements between the regulatory agencies and the implementing agencies, and that in doing so, the Program components can be constructed in a timely manner. The mitigation measures provided in the DPEIR would ensure coordination and cooperation between the regulatory agencies and the Program Team, as suggested in this comment. The need for Safe Harbor Agreements will likely be determined through coordination with the regulatory agencies during the regulatory permitting process, or, through the obtainment of incidental take permit(s) in the unlikely event that incidental take permit(s) are determined to be necessary, pursuant to the mitigation measures presented in the DPEIR. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 15-18 The comment conveys the commenters appreciation for the development of the Program, and DPEIR supporting the Program. The comment references the commenter's contact information, which will be retained in the Program file. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

REVIEW OF A DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT FOR THE REPLENISH BIG BEAR PROGRAM

Dear Ms. Burton:

16-1 | The State Water Resources Control Board’s (State Water Board) Division of Water Rights (Division) appreciates the opportunity to review the Draft Program Environmental Impact Report (DPEIR) for the Big Bear Area Regional Wastewater Agency (BBARWA)¹ Replenish Big Bear Program (Program).

Program Summary

16-2 | The Program includes permitting, design, and construction of full advanced treatment facility upgrades at the existing BBARWA wastewater treatment plant (WWTP), more than 7 miles of pipeline for product water and reverse osmosis brine minimization, three pump stations, a groundwater recharge facility, and up to four monitoring wells. With the Program, the BBARWA WWTP will produce up to 1,950 acre-feet per year (AFY) of purified water but has the capacity to produce up to 2,210 AFY. Up to 80 AFY of purified water will be discharged to Shay Pond to replace potable water and the balance of the purified water discharges will go to the Stanfield Wildlife and Waterfowl Preserve, a tributary to Big Bear Lake (Lake). The DPEIR states that Program water stored in the Lake may be removed for golf course irrigation and dust control at the Big Bear Mountain Resorts in the summer. In addition, stored Program water may be pumped from the Lake, as needed, to Sand Canyon to recharge a groundwater basin. Currently, the BBARWA WWTP discharges undisinfected secondary effluent for irrigation use in

¹ The Big Bear Area Regional Wastewater Agency (BBARWA) is the lead agency for the Replenish Big Bear Program. The Big Bear City Community Services District (BBCCSD), Big Bear Lake Department of Water and Power (BBLDWP), and Big Bear Municipal Water District (BBMWD) are Program partners.

**RESPONSE TO COMMENT
LETTER #16
STATE WATER RESOURCES CONTROL BOARD**

- 16-1 The comment introduces State Water Resources Control Board's (SWRCB) Division of Water Rights review of the DPEIR. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

- 16-2 The comment summarizes the Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

16-2 | the Lucerne Valley, while the excess water not used for irrigation is discharged to
cont'd | percolation ponds.

Wastewater Change Petition Determination

Water Code section 1211, subdivision (a) states that the owner of a wastewater treatment plant must receive approval from the State Water Board prior to making changes to the point of discharge, place of use, or purpose of use of treated wastewater. That approval is requested through submittal of a wastewater change petition to the Division. Subdivision (b) of Water Code section 1211 states that approval from the State Water Board is not required if the changes in discharge or use of the treated wastewater do not result in decreasing flow in any portion of a watercourse.

16-3 | We note that the Division's Water Code section 1211 checklist (1211 checklist) was referenced in the Bibliography on page 7-3 of the DPEIR. We also note in response to our comment letter (Comment Letter #13 State Water Resources Control Board) in the Appendices of the DPEIR, that since the Program will not result in decreasing the flow in a watercourse BBARWA concluded that subdivision (a) of Water Code section 1211 does not apply. BBARWA has also indicated they do not intend to be the entity that withdraws Program water from Big Bear Lake. Based on the information currently available, the Division agrees that BBARWA is not required to submit a wastewater change petition.

16-4 | The 1211 checklist helps identify and provide information to the State Water Board to determine if a wastewater change petition is needed and is not intended to be a self-certification. If the circumstances of the project change or additional information becomes available, Division staff recommend submittal of a completed 1211 checklist to the Division at WaterRightPetitions@waterboards.ca.gov. The link to the 1211 checklist and additional information regarding wastewater change petitions is shown below.

https://www.waterboards.ca.gov/water_issues/programs/recycled_water/docs/2021/1211_checklist_v2_accessible_3.pdf

https://www.waterboards.ca.gov/waterrights/water_issues/programs/petitions/wastewater.html

Water Right Issue

16-5 | Withdrawal of Program water from the Lake would need to be authorized pursuant to an existing water right. The Program water is not "stored" in the lake; BBARWA does not retain ownership of the Program water once it has been discharged unless a wastewater change petition is submitted and approved. In a meeting with Division staff on February 8, 2024, BBARWA indicated BBARWA would not be withdrawing Program

- 16-3 The comment details Water Code section 1211, and points specific portions of the DPEIR that reference this Code. The Division of Water Rights agrees that BBARWA is not required to submit a wastewater change petition for the change in flows to the LV Site as part of Program Implementation. The comment is noted and BBARWA appreciates the Division of Water Rights' concurrence on this matter.
- 16-4 The comment further details the Water Code section 1211, and provides contact information and recommendations should the Program change such that a wastewater change petition would be required. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 16-5 The comment states that BBARWA does not retain ownership of the Program Water once it has been discharged into the Stanfield Marsh/Big Bear Lake unless a wastewater change petition is submitted and approved. BBARWA recognizes that it does not retain ownership of the Program Water once it's been discharged into Big Bear Lake/Stanfield Marsh, nor is there any proposal in the DPEIR to withdraw Program Water from the Lake by BBARWA at this time. Should circumstances change in the distant future, BBARWA will contact the State Water Board and submit a wastewater change petition.

16-5
cont'd

water from the Lake, and withdrawals by others would be done through existing water rights held by those parties. If future withdrawal of Program water from the Lake is proposed, the ability to withdraw the water pursuant to a water right should be identified in the DPEIR, including an explanation and identification of which water rights will be used.

16-6

If you require any further information regarding this matter, please contact Patricia Fernandez at: Patricia.Fernandez@waterboards.ca.gov.

DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT, REPLENISH BIG BEAR PROGRAM, BIG BEAR AREA REGIONAL WASTEWATER AGENCY, STATE CLEARINGHOUSE NO. 2022110595

Dear Bridgette Burton:

17-1 | Santa Ana Regional Water Quality Control Board (Santa Ana Water Board) staff has reviewed the Draft Program Environmental Impact Report (DPEIR) for the Replenish Big Bear Program (Program). The Santa Ana Water Board appreciates the opportunity to provide comments on the Program.

PROGRAM SUMMARY

In general, the Program includes permitting, design, and construction of an advanced water purification facility at the existing Big Bear Area Regional Wastewater Agency Wastewater Treatment Plant. Additionally, the Program includes approximately 6.59 miles of pipeline for product water and reverse osmosis brine minimization, three pump stations, groundwater recharge, and up to four monitoring wells.

17-2 | As part of the Program, up to 2,200-acre feet per year of water is proposed to be discharged at the east end of Stanfield Marsh, which will then flow into Big Bear Lake. Additionally, up to 380-acre feet per year of water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period.

The overall Program area consists of Big Bear Valley, which is located in the San Bernardino Mountains in San Bernardino County. The Program will span just east of Big Bear Lake to the wastewater treatment plant at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the southeast of Resort Storage Pond and Sand Canyon Recharge Area.

**RESPONSE TO COMMENT
LETTER #17
SANTA ANA REGIONAL WATER QUALITY CONTROL BOARD**

- 17-1 The comment introduces Santa Ana Regional Water Quality Control Board (SARWQCB) review of the DPEIR. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

- 17-2 The comment summarizes the Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

COMMENTS

Based on the DPEIR documents, the Santa Ana Water Board offers the comments below to assist in adequately identifying, avoiding, and/or mitigating the Program's significant or potentially significant environmental impacts.

- 17-3 In 2006, the Santa Ana Water Board adopted a Nutrient Total Maximum Daily Load (TMDL) for Dry Hydrologic Conditions in Big Bear Lake for inclusion into the Water Quality Control Plan for the Santa Ana River Basin (Basin Plan). The TMDL was adopted to establish the appropriate numeric targets to protect the beneficial uses of Big Bear Lake, along with an implementation plan to attain the TMDL targets. Table 6-1a-c in [Basin Plan](#) specifies TMDL numeric targets for Big Bear Lake.

Comment # 1

- 17-4 Tables 3-4, 4.11-6, and 4.11-9 incorrectly refer to the TMDL numeric targets for total phosphorus and chlorophyll-a as TMDL objectives.

Comment # 2

- 17-5 Table 3-3 references a total nitrogen numeric target. The adopted Big Bear Lake TMDL does not include a total nitrogen numeric target.

Comment # 3

- 17-6 The DPEIR (including Table 4.11-6) only references narrative objectives for Shay Pond and Stanfield Marsh and does not include references to parameter-specific narrative objectives (i.e., UIA, dissolved oxygen, pH, etc.). The Basin Plan refers to most objectives as narrative except for waterbody-specific numeric objectives listed in Table 4-1. However, parameter-specific narrative objectives apply to all inland surface waters within the Santa Ana Region, including lakes, streams, and wetlands. Where more than one objective is applicable, the stricter shall apply.

Comment # 4

- 17-7 The DPEIR states that Big Bear Lake has the same or more stringent water quality objectives than downstream receiving waters therefore meeting the objectives of Big Bear Lake, will also meet the water quality objectives of all downstream receiving waters, so it can be concluded that downstream uses will be protected. However, Table 4.11.9 does not include Bear Creek, immediately downstream of Big Bear Lake, which has more stringent objectives for hardness, sodium, and sulfate.

Comment # 5

- 17-8 The DPEIR explains that if the Baldwin Lake Pipeline Alignment Option is chosen as part of the Stanfield Marsh/Big Bear Lake Discharge Point 1, the pipeline alignment will adversely impact the bird-foot checkerbloom (*Sidalcea pedate*), a state and federally endangered plant species. However, if not selected, a significant impact on biological resources will be avoided. Santa Ana Water Board staff recommend that other pipeline

- 17-3 The comment summarizes specific actions taken by the SARWQCB that relate to the protection of beneficial uses in the Santa Ana Basin Plan. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 17-4 The comment indicates that there is an incorrect reference to TMDL numeric targets for total phosphorus and chlorophyll-a as Total Maximum Daily Load (TMDL) objectives in **Tables 3-4, 4.11-6, and 4.11-9** of the DPEIR. The comment is noted, and the changes to the above referenced tables will be reflected in the text of the FPEIR, as follows (changes are shown in underline and ~~strikeout~~):

**Table 3-4 and Table 4.11-6
SUMMARY OF WATER QUALITY OBJECTIVES**

Water Quality Objective (WQO)	Shay Pond	Stanfield Marsh	Big Bear Lake	Big Bear Valley
Total Dissolved Solids (TDS), mg/L	Narrative Objectives	Narrative Objectives	175	300
Hardness, mg/L			125	225
Sodium, mg/L			20	20
Chloride, mg/L			10	10
Total Inorganic Nitrogen, mg/L			0.15	5
Sulfate, mg/L			10	20
Chemical Oxygen Demand, mg/L			--	--
Total Phosphorus, mg/L (TMDL Objective <u>Numeric Targets</u>)			0.035	--
Chlorophyll-a, mg/L (TMDL Objective <u>Numeric Targets</u>)			0.014	--

**Table 4.11-9
BIG BEAR LAKE WQOS VS. THE SAR REACHES LOCATED DOWNSTREAM OF BIG BEAR LAKE**

Water Quality Objective (WQO)	Big Bear Lake	SAR Reach 6	SAR Reach 5	SAR Reach 4	SAR Reach 3
Total Dissolved Solids (TDS), mg/L	175	200	300	550	700
Hardness, mg/L	125	100	190	--	350
Sodium, mg/L	20	30	30	--	110
Chloride, mg/L	10	10	20	--	140
Total Inorganic Nitrogen, mg/L	0.15	1	5	10	10
Nitrate as N	--	--	--	--	--
Sulfate, mg/L	10	20	60	--	150
Chemical Oxygen Demand, mg/L	--	5	25	30	30
Total Phosphorus, mg/L (TMDL Objective <u>Numeric Targets</u>)	0.035				
Chlorophyll-a, mg/L (TMDL Objective <u>Numeric Targets</u>)	0.014				

- 17-5 The comment indicates that **Table 3-3** of the DPEIR incorrectly references a total nitrogen numeric target, when the adopted Big Bear Lake TMDL does not include a total nitrogen numeric target. The comment is noted, and the changes to the above referenced table will

be reflected in the text of the FPEIR, as follows (changes are shown in underline and strikeout):

**Table 3-3
LAKE REGULATORY LIMITS FOR CONSTITUENTS OF INTEREST**

Constituent	Santa Ana Basin Plan WQO (mg/L)	Nutrient TMDL (mg/L)
Total Dissolved Solids (TDS)	175	
Hardness	125	
Sodium	20	
Chloride	10	
Total Inorganic Nitrogen (TIN) (mg/L-N)	0.15	
Sulfate	10	
Total Phosphorus (TP) (mg/L-P)	0.15	0.035
Total Nitrogen (TN) (mg/L-N)		4
Chlorophyll-a (mg/L)		0.014

Note: **Bolded** constituents were identified as priority in previous regulatory meetings and are specifically evaluated in this study.

17-6 The comment notes that the DPEIR only references narrative objectives for Shay Pond and Stanfield Marsh and does not include references to parameter-specific narrative objectives (i.e., un-ionized ammonia, dissolved oxygen, pH, etc.). The Program Team understands that the receiving waters also contain narrative objectives and that the most stringent limit applies. Therefore, pilot data was collected to evaluate compliance with the most stringent numeric and narrative objectives. Preliminary results are included in **Appendix 19** of the DPEIR. **Appendix 19** considered most of the narrative objectives like nutrients (including ammonia), algae, dissolved oxygen and temperature to evaluate the potential impacts to the water quality, aquatic life, and beneficial uses as a result of the Program's discharge to Stanfield Marsh and Big Bear Lake. This analysis identified that additional data is needed to fully evaluate the impacts related to boron, dissolved oxygen, pH, and temperature; therefore, water quality monitoring to collect this data is recommended once the Program's discharge is introduced to Stanfield Marsh/Big Bear Lake. The Program's discharge effluent would be monitored along with utilizing the existing Big Bear Lake Nutrient TMDL Sampling Station MWDL9.

Some of the narrative objectives in the Basin Plan were not analyzed in **Appendix 19** because Program Water will receive the highest level of treatment to produce purified water that these narrative objectives will be met. The following additional information is provided to clarify compliance with the remaining parameter-specific narrative objectives that were not fully addressed in **Appendix 19**.

- Because the proposed Program Water will be purified, the Program water will **NOT**:
 - Result in increases in chemical oxygen demand (COD) levels in inland surface waters, which could exceed 5 mg/L (Bear Creek's COD WQO) or adversely affect beneficial uses. Overall, the Program water will have low (minimal) amounts of oxidizable material present in a sample, including stable organic materials. For additional context on the treatment that will be provided, indirect potable reuse projects producing purified water using full advanced treatment are required to not exceed 0.5 mg/L of total organic carbon, which is another measure of the organic strength.

- Contain chlorine residual since ultraviolet disinfection will be used.
- Contain floating materials, including solids, liquids, foam, or scum, which could cause a nuisance or adversely affect beneficial uses.
- Result in coloration of the receiving waters, which could cause a nuisance or adversely affects beneficial uses.
- Result in deposition of oil, grease, wax, or other material in concentrations which could result in a visible film or in coating objects in the water, or which cause a nuisance or adversely affect beneficial uses.
- Contain suspended or settleable solids in amounts which cause a nuisance or adversely affect beneficial uses as a result of controllable water quality factors.
- Contain concentrations of surfactants which result in foam in the course of flow or use of the receiving water, or which adversely affect aquatic life.
- Contain taste- or odor-producing substances at concentrations which could cause a nuisance or adversely affect beneficial uses.

17-7 The comment notes that Bear Creek is a downstream receiving water of Big Bear Lake and that **Table 4.11-9** does not include a comparison of the Program Water to the objectives for this receiving water. The comment also notes that Bear Creek has more stringent objectives for hardness, sodium, and sulfate than any other receiving water. The comment is noted, and the changes to the above referenced table will be reflected in the text of the FPEIR, as follows (changes are shown in underline and strikeout):

**Table 4.11-9
BIG BEAR LAKE WQOS VS. THE SAR REACHES LOCATED DOWNSTREAM OF BIG BEAR LAKE**

Water Quality Objective (WQO)	Big Bear Lake	<u>Bear Creek</u>	SAR Reach 6	SAR Reach 5	SAR Reach 4	SAR Reach 3
Total Dissolved Solids (TDS), mg/L	175	<u>175</u>	200	300	550	700
Hardness, mg/L	125	<u>115</u>	100	190	--	350
Sodium, mg/L	20	<u>10</u>	30	30	--	110
Chloride, mg/L	10	<u>10</u>	10	20	--	140
Total Inorganic Nitrogen, mg/L	0.15	<u>1</u>	1	5	10	10
Nitrate as N	--		--	--	--	--
Sulfate, mg/L	10	<u>4</u>	20	60	--	150
Chemical Oxygen Demand, mg/L	--	<u>5</u>	5	25	30	30
Total Phosphorus, mg/L (TMDL Objective)	0.035					
Chlorophyll-a, mg/L (TMDL Objective)	0.014					

As shown above, **Table 4.11-9** will be updated in the FPEIR to include Bear Creek. **Table 4.11-7**—which depicts the anticipated Program Water discharge quality as measured by the pilot study—shows that the proposed Program Water discharge would be below these lower WQO limits. Expected Program Water quality will be validated during final design as compared to applicable water quality and regulatory requirements.

17-8 The comment recommends avoiding the significant impacts to bird-foot checkerbloom from installation of the Baldwin Lake Pipeline Alignment Option. The DPEIR considers multiple pipeline alignment options to allow for flexibility in the final engineering phase of

the Program, and as a result, discloses all potential impacts associated with each of the pipeline options. The Baldwin Lake Pipeline Alignment Option will remain included in the FPEIR because it would significantly lower the costs of implementing the Program, and would create less of a nuisance to the neighborhoods to the west of BBARWA's WWTP because it is the most direct route from BBARWA's WWTP to Stanfield Marsh. Furthermore, refer to Responses to Comment Letter #15, in which Dr. Tim Krantz suggests another method for transplantation of bird-foot checkerbloom that has been successful, which, while it would not avoid a significant impact on this species, has a potential to even further minimize impacts to this species (refer to the modifications to **MM BIO-5** provided in Response to Comment 15-11). Finally, modifications to **MM BIO-5** have been made to address the need for Section 7 consultation as well as Incidental Take Permit (ITP) obtainment from CDFW, which are necessary due to the federal nexus for the Program related to the obtainment of grants from the Bureau of Reclamation, EPA STAG, and EPA WIFIA, as well as grant opportunities being pursued from other federal and/or state agencies. The recommendation provided in this comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

17-8 | alignment options be considered for the Stanfield Marsh/Big Bear Lake Discharge Point
cont'd | 1.

Comment #6

17-9 | The DPEIR states that Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and Sand Canyon Channel are not considered waters of the United States. The identification and location of jurisdictional water of the United States, is determined by the U.S. Army Corps of Engineers, Santa Ana Water Board staff request an Approved Jurisdictional Determination for Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and Sand Canyon Channel.

CONCLUSION

17-10 | The Santa Ana Water Board appreciated the opportunity to comment on the Program's DPEIR. Santa Ana Water Board staff request our comments and concerns be addressed prior to adoption of the final PEIR.

If you have any questions, please contact me at (951) 782-4995 or at Terri.Reeder@waterboards.ca.gov.

Sincerely,

Terri S. Reeder, PG, CEG, CHG
Supervisor, Coastal Waters Planning and CEQA Section
Santa Ana Regional Water Quality Control Board

- 17-9 The comment requests approved jurisdictional delineations for Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and Sand Canyon Channel. The DPEIR presents the preliminary jurisdictional findings for the aforementioned areas. **MM BIO-27** requires preconstruction jurisdictional water surveys at least six months prior to the start of ground disturbing activities. Once this is accomplished, **MM BIO-26** shall go into effect for those individual projects that would require regulatory permitting. Thus, no jurisdictional delineations have been secured as of yet. Once obtained (and where necessary), BBARWA shall provide the documentation to the SARWQCB.
- 17-10 The contact information provided in this comment will be retained in the Program file. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

RE: Replenish Big Bear Project Draft Program Environmental Impact Report Comments, State Clearinghouse #2022110595

Ms. Burton,

18-1

The City of Redlands is happy to support the Big Bear Area Regional Wastewater Agency (BBARWA) Replenish Big Bear Project! In light of the ongoing multi-decade statewide drought, which includes the driest three-year period in recorded history, we recognize the importance of sustainable water resources projects and programs. Redlands understands that the project will discharge recycled water from the BBARWA treatment and reclamation facility into Big Bear Lake through the Stanfield Marsh and will replace/supplement the Shay Pond water source. We also understand that water will be pumped from Big Bear Lake to replenish the groundwater basin southeast of the lake.

18-2

18-3

The City of Redlands is a retail water supplier serving approximately 84,000 potable water customers through approximately 23,000 water service connections within the City of Redlands and surrounding communities. Redlands owns and operates two (2) surface water treatment plants, one (1) of which is supplied by Santa Ana River (SAR) water. Both plants are capable of receiving and treating State Water Project water provided by San Bernardino Valley, the regional State Water Contractor. Redlands receives SAR water through entitlements as a shareholder in five (5) local Mutual Water Companies – Bear Valley Mutual Water Company, Lugonia Water Company, Redlands Water Company, West Redlands Water Company, and Lugonia Park Water Company.

18-4

The Santa Ana Regional Water Quality Control Board assigned Big Bear Lake water used for crop irrigation and human consumption with water quality beneficial use designations of AGR and MUN. The Replenish Big Bear Draft Program Environmental Impact Report (Table 4-11.1) identifies the same beneficial use designations. We encourage BBARWA to continue recognizing Redlands as a downstream user of water released from Big Bear Lake and to provide

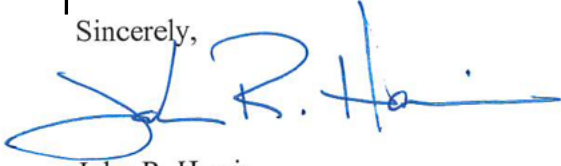

**RESPONSE TO COMMENT
LETTER #18
CITY OF REDLANDS**

- 18-1 The comment conveys the City's recognition of the importance of sustainable water resources projects such as the Replenish Big Bear Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 18-2 The comment summarizes the Program. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 18-3 The comment describes the service area of the City of Redlands, including the sources of water supply, which includes sources from Bear Valley Mutual Water Company.
- 18-4 The comment notes that the SARWQCB assigned Big Bear Lake water used with beneficial uses, including AGR and MUN, and acknowledges that the DPEIR identifies these same uses. The comment requests that BBARWA continue to recognize the City as a downstream user of water released from Big Bear Lake. BBARWA demonstrated that the impacts to the water in Big Bear Lake from discharge of Program Water to the Lake would not result in any significant impacts thereof, and determined that, as a result, impacts to downstream users, such as the City of Redlands, would be less than significant. **MM HYD-1** would require implementation of a monitoring plan to ensure that the beneficial uses of Big Bear Lake are maintained, thus meeting the intent of the request for "post construction water quality monitoring and associated contaminant/pollutant mitigation" made in this comment. BBARWA will provide this information. In addition, as discussed at the meeting on March 16, 2023, the Program Team has agreed to notify the City of Redlands of spills, releases, or exceedances related to BBARWA operations.

18-4 | post-construction water quality monitoring and associated contaminant/pollutant mitigation as
cont'd | necessary.

18-5 | The City of Redlands supports BBARWA's efforts to sustain water resources within the
mountain communities and is grateful for the opportunity to comment on the potential for water
quality impacts to downstream users.

Sincerely,

John R. Harris
Municipal Utilities & Engineering Director

Re: Draft Program Environmental Impact Report for the Replenish Big Bear Program

Dear Ms. Burton,

19-1 We would like to thank BBARWA for the opportunity to comment on the Draft Program Environmental Impact Report for the Replenish Big Bear Program, and also for the 15-day extension granted for the comment period.

19-2 Friends of Big Bear Valley (FOBBV) is an educational environmental non-profit organization representing over 10,000 members who are local residents or visitors to Big Bear Valley and who prioritize protecting the unique surrounding environment and special species and habitats here. FOBBV considers preserving and protecting these unique environmental surroundings an essential part of ensuring that this valley and its residents continue to thrive on all levels.

19-3 First, we would like to state that in general, we are absolutely in favor of the goal of keeping this reclamation water on the mountain rather than sending it down to Lucerne Valley. We appreciate the work that has been done in moving in that direction.

19-4 After reviewing the DPEIR, we have many questions and are not convinced that sufficient analysis and option evaluation has been done in some areas to make the program ready for approval to move forward.

19-5 There are significant large gaps in actual data available or presented in this document, without which it is impossible to evaluate the potential impacts. From researching the information presented, along with additional options presented by outside sources, we see that some issues may be better handled by options which have apparently not been considered or at least that are not presented in this PDEIR.

**RESPONSE TO COMMENT
LETTER #19
FRIENDS OF BIG BEAR VALLEY**

- 19-1 The comment thanks BBARWA for the opportunity to comment on the Replenish Big Bear Program DPEIR. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 19-2 The comment describes the FBBV as an organization, and notes that FBBV considers preserving Big Bear Valley's environment and the habitats and species supported therein as essential. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 19-3 The comment conveys that FBBV is in favor of keeping reclaimed water (Program Water) on the Mountain, rather than continuing to send secondary effluent to BBARWA's LV Site. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 19-4 The comment conveys concern that the analysis presented in the DPEIR is not sufficient. BBARWA disagrees that the analysis presented in the DPEIR is insufficient and will demonstrate that the data and additional analysis requested in this comment letter can already be found within the DPEIR itself, and has been expounded upon herein for clarification purposes.
- 19-5 The comment notes that FBBV feels that there are data gaps that do not provide the reviewer of the DPEIR with enough information to evaluate the potential impacts from implementing the Replenish Big Bear Program, but does not note what potential impacts specifically require additional data and analysis. Without more guidance as to which data gaps or significance conclusions of the DPEIR suffer from this alleged infirmity, BBARWA cannot provide further comment on this matter.

The comment references "options which have apparently not been considered," but does not point to which options the commenter is referring. Therefore, BBARWA cannot provide further comment on this matter. The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

19-5 cont'd | For a program of this magnitude, importance and potential significance to everyone and everything in our valley, it is paramount that the time be taken to consider and weigh in on all possible solutions to the various issues that this program presents. These options must be fully analyzed and presented in the PDEIR.

Key Missing Pieces

| First and most importantly, nothing in this PDEIR shows or states the actual data on the measured quality or resulting toxic content still remaining the program water being discharged from the advanced treatment processes and planned for so many uses.

19-6 | A huge percentage of the impacts that could result from the program and each project within it depends on the provable quality of the resulting discharge water. It is therefore essential to public comment and to any decision-making regarding this program that this piece of information be known. This key data must be presented to the public in these environmental documents before any valid evaluation can be made by the decision-makers, the agencies or the public regarding the true potential impacts.

19-7 | In addition, there are other major questions and plan details that have been addressed only on the basis of assumptions rather than actual knowledge determined from data. With that, it is impossible to fully determine the actual potential environmental impacts of program components at this point.

19-8 | It is essential to moving forward that these gaps in data and knowledge be filled in so that any potential impacts are clear-cut and based on actual data before any final conclusions can be made. Only then can real solutions to these potential impacts be presented, along with sound assurances that the impacts can be lowered to less than significant.

Detailed Comments and Questions

19-9 | **Overall program**

- What is the identity and percentage of any remaining constituents in the program discharge water?

19-10 | - How does the quality of the discharge water, by measured data, compare with the current shed water that is running into Stanfield Marsh and Big Bear Lake?

19-11 | - How does the quality of the discharge water, by measure data, compare with the current ground water being used as the valley's drinking water?

19-12 | - To continue improving the quality of the water in future, this program must continue being upgraded with new technology as it becomes available. Are there requirements in the program for these upgrades to be done in future? If not, why not?

19-6 The comment conveys that the DPEIR does not present the water quality of the Program Water to forecast impacts. As discussed in the impact analysis presented on pages 4-638 to 4-663 of the DPEIR, BBARWA temporarily installed a small-scale advanced treatment system (referred to as the Pilot Study) to purify BBARWA's wastewater using the same treatment processes proposed for the full scale Program and collected water quality samples to evaluate the treatment performance and assess if the Program Water would effectively meet all the regulatory limits set in place to protect public health and the environment. The Pilot Study was operated from February 2023 through mid-March 2024. The full Pilot Study Report, which will document the details of the pilot testing is expected to be complete by summer 2024. Preliminary water quality results collected as part of the Pilot Study from June to September 2023 were available during the development of the DPEIR were used to complete **Appendix 19** and confirm the conclusion of previous analyses, which were used to complete Section 4.11. The full set of preliminary water quality results are included in Appendices A and B of **Appendix 19**. Overall, the water quality impacts related to the use of Program Water at each proposed discharge location (i.e., Stanfield Marsh/Big Bear Lake, Shay Pond, and the local groundwater basin) are discussed in Section 4.11 of the DPEIR.

Appendix 19 assessed the preliminary results to evaluate the impacts of the purified water on aquatic life in Big Bear Lake. As part of the Pilot Study, on July 20, 2023, BBARWA collected and analyzed more than 260 constituents and used the testing methods with the lowest detection limits to ensure an accurate evaluation was completed. Of the 260+ constituents analyzed, only 35 constituents were detected. **Table 3** of **Appendix 19** contains the preliminary results of the constituents that were detected in the first sample. Overall, this analysis concluded that all the constituents analyzed meet the most stringent limit except for total inorganic nitrogen (TIN) as the average concentration was 0.21 mg/L for the period evaluated. To address this issue, BBARWA extended its Pilot Study to test another RO unit to see if expected limits for TIN can be reliably met using other available treatment equipment. BBARWA is also exploring the potential need for additional treatment equipment to meet the TIN objective of 0.15 mg/L, which is one of the most stringent in the State of California. Because the Program Water will be treated with reverse osmosis (RO) membranes and UV/AOP, which are treatment systems capable of removing any constituents larger than 0.0001 microns and destroying viruses and bacteria, the Program Water will be purified and contain very low concentrations of most contaminants as demonstrated by the data collected by BBARWA.

19-7 The comment conveys concern that there are questions and plan details that have been addressed on the basis of assumption rather than hard data. The commenter does not point to the specific assumptions to which the commenter is referring. Without more guidance as to which specific assumptions or significance conclusions of the DPEIR suffer from this alleged infirmity, BBARWA cannot provide further comment on this matter.

19-8 The comment conveys that the data gaps referenced in the previous comments must be filled in order to verify the significance conclusions contained in the DPEIR. Without more guidance as to which specific data gap or significance conclusions of the DPEIR suffer from this alleged infirmity, BBARWA cannot provide further comment on this matter.

19-9 The comment asks what constituents remain in the Program Water after the advanced purification process. Refer to Response to Comment 19-6 for the water quality data that was used to complete the DPEIR. Refer to page 4-640 of the DPEIR, specifically **Table 4.11-7** and the analysis contained on pages 4-638 to 6-663 of the DPEIR regarding water

quality, which depicts the projected average effluent quality of the proposed discharge in comparison with the existing ambient Lake water quality.

- 19-10 The comment asks how the Program Water compares to the water quality of stormwater runoff that flows to Stanfield Marsh and Big Bear Lake. The stormwater quality data has not been collected so it is not available to evaluate the quality of runoff that flows into Big Bear Lake. However, as discussed under Responses to Comments 19-6 and 19-9, the DPEIR demonstrated that the quality of the Program Water would meet the stringent WQOs of Big Bear Lake, Stanfield Marsh, and other downstream receiving waters. Furthermore, BBARWA would be required to meet the very stringent requirements that have been established by regulators to protect public health and the environment.
- 19-11 The comment asks what the quality of the Program Water is anticipated to be in comparison to the water quality of groundwater that is utilized to serve customers in Big Bear Valley. This data can be found in the DPEIR on page 4-656. **Table 4.11-10** of the DPEIR compared the most stringent water quality objective to Big Bear City Community Services District's potable water near Shay Pond and the proposed Program Water. Based on this table, the projected effluent quality of the proposed discharge to Shay Pond is better than the current potable water supply for chloride, hardness, sodium, sulfate, TDS, TN, aluminum, and specific conductance. The projected effluent quality of the proposed discharge is expected to be of similar quality to existing potable water supplies for ammonia, fluoride, Methylene Blue Active Substances (MBAS), cadmium, copper, and lead. Boron may be the only constituent that could be above the existing potable water supply quality. The projected boron effluent quality of the proposed Shay Pond Discharge (0.11 mg/L) is anticipated to exceed Shay Pond ambient water quality (0.059 mg/L – based on one sample collected in November 2021), but remain well below the most stringent criterion of 0.75 mg/L for the protection of sensitive crops. Therefore, Shay Pond's boron assimilative capacity, defined as the difference between the criterion and the ambient water quality, is 0.691 mg/L (i.e., 0.75 mg/L – 0.059 mg/L). Per the 2018 Recycled Water Policy, if a groundwater recharge project proposes to utilize less than 10 percent of the available assimilative capacity in a basin or subbasin, the antidegradation analysis only needs to demonstrate that the project will use less than 10 percent of the available assimilative capacity. If a similar approach is used for Shay Pond, this means an increase of up to 0.0691 mg/L would be allowed. If this is added to the ambient water quality, the maximum boron concentration in Big Bear Lake would be about 0.128 mg/L, which is higher than projected Program Water. The projected boron concentrations with the proposed Program Water discharge to Shay Pond are not estimated to exceed this concentration. Thus, the water quality impacts related to boron would be less than significant because less than 10% of the assimilative capacity would be consumed.
- 19-12 The comment asks how the AWPf will adapt to future, more stringent water quality objectives. BBARWA will be regulated under a National Pollutant Discharge Elimination System (NPDES) permit, which will be renewed every five years. Each time the permit is renewed, regulators use the strictest water quality objective limits during their analysis. If a permittee exceeds certain limits, regulators will ask the permittees to address the issues within a specified amount of time to be determined by the regulators. In this way, dischargers, such as BBARWA, are regulated to ensure they meet the regulations in place.

- 19-13 | - It seems that this program is being rushed and moved forward without all the key knowledge yet know. Is there some background reason for this rush? If so, please present this to the public so that it can be taken into consideration in public comment and evaluation.
- 19-14 | - Is there sufficient known data for all outside agency permits to be obtained? If not, this information must be made known to the public prior to the public being required to understand and evaluate the validity and potential environmental impacts of the program and each project within it.
- 19-15 | - What are the costs of the program, including initial and construction costs, as well as ongoing annual costs? How much of that cost would be paid by the public/residents versus grant or private funding, both initially and ongoing?
- 19-16 | - One study from China cited in the PDEIR does not seem to be sufficient as the basis to assume that the Advanced Treatment systems selected will work to remove 100% of toxins. Multiple studies must always be reviewed and utilized to confirm scientific results. What other studies have been utilized in these analyses for comparison and confirmation?
- 19-17 | - There are studies published that show that only 20 to 90% of certain types of toxins are removed through these advanced treatment methods. What is different in the planned advanced treatment for this program that makes it any better than what those studies have found? (See Appendix, Reference 1)
- 19-18 | - What analysis has been done on the actual level of all pesticides, herbicides, microplastics, personal care products, and pharmaceuticals that could still remain in the discharge water? And which portions of the advanced treatment upgrade assure the removal of each of those? Please present actual test data from the pilot system.
- 19-19 | - How will the program components be mitigated to prevent any significant impact from contaminants in the water that cannot be fully removed on aquatic ecosystems and bird and wildlife species that would be exposed on a long term basis?
- 19-20 | - Reverse osmosis is known to take out all minerals, which can create issues in humans (See Appendix, Reference 2). Is the water being re-mineralized before being discharged? Or has there been any analysis for what impact water that is void of all minerals has on wildlife? What mitigations are being proposed to reduce any impacts?
- 19-21 | - Have the nitrogen levels been measured in the discharge water to know what impact this water might have on the algae systems in the lake?
- 19-22 | - How will the mitigation measures be enforced now, during construction and into the future? This valley, both in the City and in the County has many mitigation measures that have been set up initially and then forgotten and not enforced over the long term. (We would be happy to pull together a sample list of these, if that

- 19-13 The commenter alleges that the Program is being rushed forward without the key data necessary to forecast impacts. BBARWA disagrees with the assertion that this process has been “rushed,” particularly given that there is a long history dating back to 1980 of exploring water reuse opportunities in the Big Bear Valley to keep this valuable resource within the watershed. BBARWA and its partner agencies have conducted several studies to evaluate the different alternatives possible. BBARWA directs the reader to **Appendices 1, 3, 10, and 20**.
- 19-14 The comment asks whether sufficient data exists to support the various permits that would be required to be obtained to implement the Program. There is sufficient data contained in the DPEIR to support the ultimate applications for the various permits outlined in **Table 2.6-1** (page 2-7 of the DPEIR). The environmental documentation has been prepared to meet CEQA requirements, and additional data may be requested by the agencies that would issue the permits, but this would be handled through the permitting process and would be at the discretion of the permitting agency to request additional data.
- 19-15 The comment requests the cost of implementing the Program, and the cost to be paid by the residents to support the implementation of the Program. Please refer to the Replenish Big Bear Program website for the latest updates and costs: <https://www.replenishbigbear.com/about>

Currently, the estimated construction and implementation costs to build the AWP and pipeline to Stanfield Marsh are approximately \$86.7 million which includes a \$22 million contingency. BBARWA has received approximately \$17.9 million in grant funding and is awaiting a response from the respective government agencies on one additional grant. BBARWA is also pursuing a low-interest federal loan to fund up 80% of the total eligible costs, minus federal grants. BBARWA is also continuously exploring additional grant opportunities and potential contributions from additional beneficiaries of the Program to reduce the costs to residents.³

The Sand Canyon Recharge Project facilities will be funded separately and total approximately \$3 million.

- 19-16 The comment questions the use of a study from China to justify of the effectiveness of the UV/AOP system to treat CECs and PPCPs. Please refer to Response to Comment 13-3, which fully addresses the questions and concerns raised in this comment.
- 19-17 The comment utilizes a reference to suggest that only 20 to 90% of certain toxins are removed through advanced treatment, and asks what the difference is between the referenced study and the Program. The reference cited discusses the principles and process of RO treatment for household drinking water. Although this is a great resource for learning more about RO treatment, household ROs are smaller and are not required to meet the strict requirements set by government agencies that would regulate this Program. Programs such as the Replenish Big Bear Program are required to add multiple physical and chemical treatment processes to meet the needed removal efficiencies to comply with the permit limits. Please refer to Responses to Comment 19-6, 19-9, and 19-

³ Replenish Big Bear, 2024. Replenish Big Bear Program update March 2024. https://www.replenishbigbear.com/news?utm_campaign=4b405e8a-387c-4323-8bf6-256980b92ed5&utm_source=so&utm_medium=mail_lp&cid=115e8001-e4d5-4345-a55f-4f50d3359fba (accessed 04/22/24)

10, the DPEIR demonstrated that the quality of the Program Water would meet the stringent Water Quality Objectives (WQOs) of Big Bear Lake, Stanfield Marsh, and other downstream receiving waters.

- 19-18 The comment asks what pesticides, herbicides, microplastics, personal care products, and pharmaceuticals could remain in the Program Water that has undergone full advanced treatment. Please note that most of the personal care products, pharmaceuticals, and microplastics are not yet regulated or have reliable testing methods to evaluate concentrations, as discussed in Response to Comment 13-3. Some pesticides and herbicides are currently regulated and were monitored as part of the Pilot Study. As discussed in the Response to Comment 19-6, BBARWA analyzed more than 260 constituents and used the testing methods with the lowest detection limits to ensure an accurate evaluation was completed. **Table 3 of Appendix 19** of the DPEIR presents the constituents that were detected in the first monitoring sample that tested for more than 260 constituents. Of the 260+ constituents monitored, only 35 were detected, of which three are of interest. Di(2-ethylhexyl)adipate, which is used primarily as a plasticizer, and trichloroacetic acid, which is used in making medicines, pharmaceuticals, and pesticides, were detected at very low concentration, and were well below the most stringent regulatory criterion. N-Nitrosomorpholine was also detected but no regulatory limits have been set. The Pilot Study final report with additional water quality data will be finalized in the summer of 2024.
- 19-19 The comment asks what mitigations would be in place to ensure that significant impacts on aquatic systems, bird species, and wildlife species would not be impacted by the use of Program Water. As discussed in **Appendix 19** of the DPEIR, specific constituents will be monitored so that the SARWQCB can monitor and evaluate the discharge's impacts. Furthermore, monitoring is recommended once the Program's Water is introduced to Stanfield Marsh/Big Bear Lake, and would be monitored with mitigative adaptation to address any impacts through the implementation of **MM HYD-1**. Additionally, the actions necessary to adapt and mitigate any beneficial use or WQO conflicts observed through the monitoring program that will be undertaken as part of Program operations will be enforced through **MM HYD-1** (refer to the discussion on pages 4-638 to 6-663 of the DPEIR regarding water quality).
- 19-20 The comment references a study that indicates that RO removes minerals from water, and asks what is proposed to address the removal of needed minerals from the Program Water. The Program Water will be stabilized with minerals before it is discharged into Shay Pond and Stanfield Marsh. The RO process removes dissolved solids, including minerals, resulting in low levels of calcium hardness and alkalinity. Stabilization is required to protect distribution pipelines, pump stations, and storage tanks.
- 19-21 The comment asks whether the nitrogen levels have been measured in the Program Water to determine what impacts algae may have in Big Bear Lake. Pilot study results (**Appendix 19** Table 3 of GEI's TM) indicated that the average TIN in the water produced by the pilot treatment system exceeded the Santa Ana Basin Plan WQO of 0.15 mg/L. As noted in the Response to Comment 19-6, treatment process optimization is being explored to attain a higher removal efficiency to meet the most stringent TIN WQO of 0.15 mg/L. As TIN has a WQO under the Santa Ana Basin Plan, if this objective is not met, BBARWA would not be permitted to discharge to Stanfield Marsh. For the purposes of this analysis, it is assumed that treatment optimization will result in attainment of 0.15 mg/L TIN. As a result, the beneficial uses would be maintained under the Program. However, if additional

treatment equipment is needed to meet this objective or if regulatory compliance mechanisms are pursued to allow discharge above the objectives, consistency with the Program CEQA documentation will be verified, and, if determined necessary to comply with CEQA, subsequent CEQA documentation will be conducted. Impacts were determined to be less than significant.

Assuming the TIN WQO is met through additional treatment optimization, and as discussed in Section 4.11.10 under the header **Stanfield Marsh/Big Bear Lake Discharge – Impacts on Surface Water Quality** beginning on page 4-638 of the DPEIR, and in the Antidegradation Analysis (**Appendix 3**), the proposed discharge is estimated to improve water quality in Big Bear Lake for total nitrogen (TN), total phosphorus (TP), and chlorophyll-a, maintain similar water quality for TIN. These constituents were evaluated because nutrients can cause algae to grow in the Lake. Per the Total Maximum Daily Load (TMDL) for Big Bear Lake for Dry Hydrological Conditions, (Nutrient TMDL), TP is the primary limiting nutrient in Big Bear Lake, meaning that TP has a stronger correlation to algae blooms than TIN. Per the Pilot Plan preliminary water quality data, TP concentration of the Program water will be below the TMDL numeric objective of 0.035 mg/L. The predicted long-term average concentrations of TIN, TN, TP, and chlorophyll-a were lower with the proposed Program Water at various rates as compared to the predicted baseline condition, except for TIN under the 2,210 AFY + TP Offset. It is unclear why the model predicted increased TIN under this scenario while all other scenarios showed significantly reduced TIN values relative to the modeled baseline; however, the modeled difference in TIN between the Baseline and 2,210 AFY + TP Offset scenarios is approximately 4 percent, which is within the range of model variance and is considered statistically insignificant.

- 19-22 The comment asks how mitigation would be enforced over the short- and long-term. The agency undertaking the implementation of a given component of the Program (i.e. Implementing Agency/member of the Program Team) would utilize the Mitigation Monitoring and Reporting Program (MMRP) prepared for the Program that has been compiled as part of the FPEIR to facilitate the continued implementation of the mitigation measures identified in the FPEIR to minimize impacts from implementation of the Program. As Lead Agencies, the Implementing Agency of a given Program Component would be responsible for implementing the MMRP, and the Program Team is committed to ensuring that this mitigation is followed through with not only to comply with the law, but also to ensure continued protection of the environment as identified in the FPEIR.

- 19-22 | would be beneficial.) For this huge program, it is essential that mitigations are
cont'd | enforced both short and long term.
- 19-23 | - Has a full analysis been conducted on how the change from the current water to
include the discharge water will affect bird species, fish, other wildlife and
habitats?
- 19-24 | - There are many details in the PDEIR that are not specifically pinned down, for
example: "4 monitoring wells will be drilled concurrently or at different times." If
either option will cause potentially significant impacts, that needs to be stated. If
that is not the case, what criteria will be used to determine the actual plan? And
what are the potential impacts of each option? (These statements and questions
are true for all areas and options discussed in the PDEIR. There is not sufficient
time in the comment period to detail them all here.)
- 19-25 | - The map of added solar panel locations on page 1475 of the technical
appendices does not show same solar locations as Figure 9 of the PDEIR main
document. Which is correct? How will the final site be determined? Some of the
locations noted in Figure 9 appear to be residential homes. Has the availability of
those sites been evaluated and/or procured?

Brine Evaporation Ponds

- 19-26 | - This brine is not simply salts, but contains ALL the toxins that have been
removed from the water through the advanced treatment facility. What is the
actual content, including types of salts, and remaining toxic materials such as
pharmaceuticals, herbicides, pesticides, personal care products, and
microplastics, of the brine slurry that would be going into these ponds?
- 19-27 | - The salt deposits in these evaporation ponds are known to be environmental
hazards. (See Appendix, Reference 3). What mitigations are being proposed to
keep the salt deposits contained and properly collected rather than blowing away
in the wind? If any of these deposits do get blown, what are the potential impacts
and how will they be mitigated.
- 19-28 | - These ponds are very large holes dug into the earth. What mitigations are being
done to keep animals and wildlife from falling into and being trapped in these
holes?
- 19-29 | - Any open area is inviting to birds to investigate. BIO-29 says that "To avoid any
harm to waterfowl that may utilize the Solar Evaporation Ponds, BBARWA shall
install bird deterrents at the Solar Evaporation Ponds to discourage waterfowl
use of the ponds. The deterrent shall encompass access control through tarps or
screens limiting bird access to the surface of the Solar Evaporation Ponds." What
types of tarps and/or screens are being proposed?

19-23 The comment asks whether a full analysis has been conducted on how the Program Water will impact bird species, fish, other wildlife, and habitat. BBARWA points the commenter to the analysis prepared by GEI, provided as **Appendix 19** to the DPEIR. This analysis was prepared to analyze “potential impacts to the water quality, aquatic life, and beneficial uses as a result of the Program’s discharge to Stanfield Marsh and Big Bear Lake” (**Appendix 19**, page 1). This study utilized modeled outputs specific to Big Bear Lake and utilized pilot data for the Replenish Big Bear Pilot Study collected between June and September of 2023, in addition to the Antidegradation Analysis prepared by WSC, provided as **Appendix 3** to the DPEIR to forecast impacts. This analysis is presented in the DPEIR to analyze impacts under two separate topics and issues (Biological Resources and Hydrology and Water Quality). As this comment also pertains to Biological Resources, BBARWA directs the commenter to page 4-240 under the “Other Physical Changes to the Environment” header.

Impacts to bird species, fish, other wildlife, and habitat that would be impacted by the discharge of Program Water to Big Bear Lake via Stanfield Marsh were analyzed on pages 4-241 through 4-249. This analysis utilizes the beneficial uses of Big Bear Lake and Stanfield Marsh to forecast impacts to special status species, habitats, and wildlife protected therein. Thus, by analyzing the beneficial uses of these water bodies, a determination of impacts to special status species, habitats, and wildlife protected therein can be made. BBARWA points the reader to the beneficial uses listed on pages 4-242 and 4-243 of the DPEIR, which not only lists the beneficial uses of Big Bear Lake and Stanfield Marsh, but also explains why the protection of these beneficial uses would indicate that the Program can be implemented without significant impacts to special status species, habitats, and wildlife. The analysis concluded that the discharge of Program Water to Big Bear Lake via Stanfield Marsh would not result in impairment of the beneficial uses of these waterbodies, and would therefore have a less than significant potential to impact special status species, habitats, and wildlife protected therein. This impact conclusion requires implementation of **MM HYD-1**, which would ensure that long-term monitoring and adaptive mitigation is implemented to protect to beneficial uses of Stanfield Marsh and Big Bear Lake, minimizing impacts to the RARE and WILD designations thereof.

Impacts to the Unarmored Threespine Stickleback (Stickleback) are documented in the second paragraph under the Other Physical Changes to the Environment” header. It was determined that, *“should the Program Team decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**, below. This MM details the additional studies that will be necessary to ensure that the product water is suitable to support this species”* (page 4-241). Furthermore, please refer to responses to CDFW’s comments, specifically Responses to Comments 20-13 through 20-16. The AMMP required by **MM BIO-6**, as modified by these Responses to Comments (refer to Response to Comment 20-16), would ensure that impacts to Stickleback would be minimized as the Shay Pond Discharge Project as a whole would simply not be able to go forward without USFWS and CDFW approval to *“carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible”* (this is a direct quote from **MM BIO-6**).

Based on the evidence provided above, the direct response to the question raised in this comment is, yes.

19-24 The comment indicates that many details provided in the DPEIR are not specific, and cites a specific quote from the DPEIR, though without a page reference. The comment requests

a determination of significance for each option presented as part of the Program, and further indicates that this comment applies to all areas and options discussed in the DPEIR. It is important to note that CEQA does not require the level of analysis presented in an EIR to be “exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible” (CEQA Guidelines §15151). The specific quote provided by the commenter is a great example of an instance in which the DPEIR provides the reasonably foreseeable manner in which construction may occur. In most instances, when a project or program undergoes CEQA analysis, it has not yet been defined to the point in which every detail of construction or operation is known, as these details require engineering data and construction contracts that cannot be awarded for public agencies until the CEQA process has been concluded. Thus, as stated on page 3-72, the monitoring wells may be drilled concurrently or at different times, depending on the ultimate schedule determined by the Program Team in coordination with the contractor.

For analysis purposes, this DPEIR analyzes the greater impact in the case where two methods of construction are considered, but more importantly, the specific construction scenarios modeled for air quality, energy, GHG, and Noise purposes are presented in the respective impact analysis sections. For instance, the construction duration and equipment assumptions for each individual project considered under the Program are presented in each of these Subchapters (Subchapters 4.4, 4.7, 4.9, and 4.14). Furthermore, the DPEIR analyzes environmental effects to the extent information exists to enable such an evaluation, even when such an evaluation requires forecasting, but the DPEIR terminates analysis where evaluation of the impact is too speculative for evaluation (CEQA Guidelines §§15144, 14145). Generally, environmental analysis was terminated where the particular location of future project is not known—for this Program, the Sand Canyon monitoring well locations are the only component for which the location is unknown. Additionally, analysis of site-specific biological resource impacts can only occur once a site is identified or, in the case of Stickleback and the development of the Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level or where a project has not yet been defined in sufficient detail in the planning process to be analyzed at a site-specific level—in the case of Stickleback and the development of the Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level.

- 19-25 The comment questions the solar locations that were analyzed in the DPEIR. It is unclear what specific figure “**Figure 9**” is that the commenter is referring to; the first instance of the solar locations appearing in the DPEIR is in **Figure 1-4**. The second figure the commenter refers to appears to be **Figure 12b** of the BRA provided as **Appendix 12**. This figure is also provided in the DPEIR as **Figure 12b**. Due to the sale of **Figure 12b**, the appearance of the solar locations is less clear than the site specific figure provided as **Figure 1-4**. The BRA and other technical studies that required site surveys utilized **Figure 1-4** as the reference locational figure to initiate site surveys. As previously stated, documents such as the Replenish Big Bear Program DPEIR utilize the Program EIR (CEQA Guidelines §15168) to analyze a range of activities that can be implemented to accomplish the objectives of the Program at hand. In this instance, BBARWA desires to install a solar array that would account for the majority of the energy required to operate the proposed AWP and associated facilities at its WWTP site. The specific size and area necessary to install a solar array of this magnitude has been conceptualized, but the concrete specifications will be determined by the solar contractor once a contract has been awarded for this effort (refer to Response to Comment 19-24, construction contracts for public agencies cannot be awarded until the CEQA process has been conducted for

“projects” requiring a CEQA determination). As such, the DPEIR analyzed the potential for construction and operation of solar arrays located within the areas presented in **Figure 1-4**.

This comment notes that some of the areas shown on the referenced figure (**Figure 1-4**) appear to be residential homes. The areas shown atop structures on **Figure 1-4** are all owned and operated by BBARWA as part of its operations. No residential homes would be impacted.

- 19-26 The comment asks what the actual content of the brine generated by the AWPf processes would be. The brine concentrations depend on the recovery rates achieved by the AWPf and the characteristics of the wastewater treated. Analysis of the brine content was not conducted during the Pilot Study because projects using RO treatment are typically not required to conduct extensive water quality monitoring on the brine, so limited information is available at this time on the content of the brine that will be produced by BBARWA.

As discussed in Response to Comments 13-13 and 19-43, the evaporation ponds will be designed, constructed, and operated in a manner to prevent brine from spilling or leaking into Baldwin Lake or groundwater supply. Furthermore, as discussed in Response to Comment 19-27, under normal conditions, the pond will be continuously monitored and fed with brine, thereby keeping most of the brine solids submerged and protected from blow off.

To address potential concerns related to wildlife and birds, BBARWA did proactively test the brine for selenium concentration as part of the Pilot Study to evaluate the potential impacts of the brine on birds, should they be exposed to the brine. The results are shown in the table below. Overall, selenium is a naturally occurring element present in sedimentary rocks, shales, and soils and can be released into water resources by natural sources via weathering and by anthropogenic sources, like mining, coal fire power plants, and agricultural irrigation. Per the USEPA, selenium is a nutritionally essential element for animals in small amounts, but toxic at higher concentrations. Selenium bioaccumulates in the aquatic food chain, and chronic exposure in fish and aquatic invertebrates can cause reproductive impairments (e.g., larval deformity or mortality). Selenium can also adversely affect juvenile growth and mortality.

In 2016, the EPA released the final aquatic life ambient water quality criterion for selenium in freshwaters. This criterion provides recommendations to states and tribes authorized to establish water quality standards under the Clean Water Act and includes information to help states to develop site specific criteria that account for differing local conditions. Please note that these EPA criteria are not effective under the Clean Water Act until they have been adopted into state water quality standards and approved by EPA, which has not yet occurred in California. The 2016 criterion reflects the latest scientific knowledge, which indicates that selenium toxicity to aquatic life is primarily based on organisms consuming selenium-contaminated food rather than being exposed only to selenium dissolved in water.

Sample Date	Preliminary Results From First Stage RO	Units
7/7/2023	1.1	ug/L
8/3/2023	<1	ug/L
8/31/2023	<1	ug/L
Hazardous Waste Criteria	1000	ug/L
EPA 2016 Selenium Criterion Monthly Average Exposure for Lentic Freshwater ⁴	1.5	ug/L

Based on a comparison of the brine results and criteria available to protect birds and wildlife, the brine is not considered hazardous, and the selenium concentration is below the EPA recommended criterion for freshwater bodies. BBARWA will work with the SARWQCB to permit the ponds, which will include monitoring requirements to assess the brine concentrations of specific constituents. If brine concentrations are higher than the recommended thresholds, BBARWA will work with regulators to protect the environment and wildlife.

- 19-27 The comment references a study of an agricultural evaporation pond complex in the San Joaquin Valley that identified salt deposits as potential environmental hazards, and questions how blow off of precipitated brine would be prevented. The evaporation ponds constructed as part of the proposed project will be designed and operated differently than the evaporation ponds referenced in the study. As the water level in the proposed brine pond decreases through evaporation, the salt in the brine will crystallize and settle as solids underwater along the sides and bottom of the pond. Under normal conditions, the pond will be continuously monitored and fed with brine, thereby keeping most of the brine solids submerged and protected from blow off. If evaporation rates were high and operating levels dropped, manual wetting of brine solids deposited along the pond's sloped banks would be performed to mitigate wind-blown brine being introduced into the air.

In addition, because the RO unit will recover >98% of the treated water and the size of the pond being relatively large due to low evaporation rates, BBARWA is not anticipating having to remove the crystallized brine solids during the lifespan of the evaporation ponds. When it is to be removed, it will be tested, collected, and disposed of in accordance with state and federal regulations based on its composition.

- 19-28 The comment conveys concern that the solar ponds would be very large holes that could impact animals that fall into and become trapped within these holes. The commenter is directed back to **Figure 1-4**, which shows that there are already several ponds within BBARWA's WWTP site, and the area in which the Solar Evaporation Ponds would be installed is already a "large hole" in the ground. BBARWA has not witnessed any impacts on wildlife from these ponds, and the entirety of BBARWA's WWTP site is fenced, and would remain fenced as part of this Program, which deters larger wildlife from entering the site. Furthermore, as discussed in Responses to Comments 13-10 and 13-11, the use of tarps may impede the evaporation process for the brine; however, the determination of

⁴ EPA, 2016. Aquatic Life Ambient Water Quality Criterion for Selenium in Freshwater 2016 – Fact Sheet https://www.epa.gov/sites/default/files/2016-06/documents/se_2016_fact_sheet_final.pdf (accessed 03/21/24)

the appropriate use of bird deterrents—utilization of either tarps or screens—will be determined as part of the final design and engineering process. Only materials that would not hinder the efficacy of brine evaporation would be utilized. The Solar Evaporation Ponds would not be shaped in a way that would prevent a small animal such as a squirrel from escaping (i.e. there will not be a sheer drop off along the sides). Thus, no mitigations are necessary, beyond the design of the Solar Evaporation Ponds themselves, to ensure that impacts to wildlife would be insignificant.

- 19-29 The comment asks what type of tarps and/or screens are being proposed. Please refer to Responses to Comments 13-10 and 13-11. The responses therein respond to the question posed in this comment pertaining to bird screens completely.

- 19-30 | - Have these tarps or screens or any other deterrent that is anticipated to be used been determined to be safe for wildlife or birds that may land on or step on it? Where is the data showing this?
- 19-31 | - Where is the data showing that these selected deterrents of tarps or screens have been effective and how effective in other places they have been utilized?
- 19-32 | - What other possible deterrents besides tarps or screens were investigated to assure that birds cannot land in this toxic slurry of brine? And why were other options eliminated in favor of tarps or screens?
- 19-33 | - If screens are used, what measures will be taken to keep birds and wildlife from getting entangled in the screens?
- 19-34 | - If tarps or screens are the only mitigation to keep wildlife out, how will those tarps or screens be attached to and kept atop the berms to assure that nothing gets through them?
- 19-35 | - Will these tarps or screens be removed for brine collection? And if so, how will birds and wildlife be kept away from the area during these processes?
- 19-36 | - If tarps are used, how much will this slow down the evaporation process? Has this slow-down been taken into account in the size of the ponds and the amount of brine they can hold given the expected output?
- 19-37 | - How will the program ensure that the tarps and screens do not assist in the development of toxic chemicals during the evaporation processes?
- 19-38 | - Other regions that have brine evaporations needs, have this process completely contained in buildings, using heat and other methods for evaporation. Has this option been considered for this Replenish Program? If not, why not? If so, what were the criteria used for eliminating it and choosing the open pond option?
- 19-39 | - Besides these evaporation ponds, what other options were considered for handling the brine resulting from these treatment processes? Why were the other options that were considered eliminated?
- 19-40 | - What is the criteria for the final determination of the actual depth (between 6 and 8 feet) and the actual size (400-800 feet X 400-800 feet) for the evaporation ponds? How will the size determine the difficulty in protecting wildlife from the ponds, especially with tarps or screens and how they are being kept in place across the area? What impact will the size have on the difficulty of removing the resulting brine from the area?
- 19-41 | - Especially during times of such things as high water levels and/or deep snow levels, what plans and mitigations are being done to keep the brine contaminants from seeping up through the snow or high water and into Baldwin Lake water?

- 19-30 The comment asks whether bird deterrents, such as the tarps and screens proposed in **MM BIO-29**, are safe to utilize without adversely impacting wildlife. Please refer to the Responses to Comments 13-10 and 13-11. The use of tarps may impede the evaporation process for the brine; however, the determination of the appropriate use of bird deterrents—utilization of either tarps or screens—will be determined as part of the final design and engineering process. Only materials that would not hinder the efficacy of brine evaporation would be utilized. The ponds will be monitored as part of BBARWA’s normal operational procedure for any potential bird activity, but the use of bird screens is common practice in many industries. Specifically, bird netting is utilized in agricultural practices, industrial structures to prevent bird entry, and other applications.⁵ As previously stated, there are a number of products that can be utilized that are designed to control bird access while also minimizing the potential for any impacts to birds.
- 19-31 The comment requests data showing the efficacy of the use of bird screens. Please refer to the references provided in Response to Comment 19-30, which responds to the question raised in this comment completely.
- 19-32 The comment asks what bird deterrents were investigated for use other than tarps or screens. As stated under Response to Comment 13-11, BBARWA is open to exploring alternatives, but none have yet been identified that would be equally effective to the use of bird screens, or that would not have potentially significant consequences on birds that utilize the area. For instance, bird deterrents such as bird cannons, bird bombs, and whistler pyrotechnics could be utilized, but these deterrents are disruptive, and as such, a more passive bird deterrent—netting/screens—was preliminarily selected for use by this project.
- 19-33 The comment asks what measures will be taken to ensure that birds and other wildlife do not get tangled in the screens. Please refer to the Responses to Comments 13-10 and 13-11, as well as 19-30 and 19-31, above, which responds to the question raised in this comment completely.
- 19-34 The comment asks how the screens will be fixed to the evaporation ponds. Based on the type of screen selected, because the engineering and design for the Solar Evaporation Ponds is not at a 100% design level, the screens fixed to the Solar Evaporation Ponds would be installed per the manufacturer’s instructions.
- 19-35 The comment asks how birds will be deterred from the brine evaporation ponds during the collection of brine. First, it is important to note that the intent of the installation of the bird deterrents is to prevent the birds from utilizing the ponds when liquid brine is present. As previously stated, the brine quality will be monitored as part of the permit issued to BBARWA to operate the facility, and it must meet the regulatory standards therein. Furthermore, as part of BBARWA’s standard operating procedures, it will establish protocols for deterring birds when collecting precipitated brine that would ensure that birds do not utilize the ponds during this period in which netting would not be present, such as utilizing a green light laser to manually deter birds that enter the area during brine removal.⁶

⁵ University of Nebraska, March 1991. Bird Hazing and Frightening Methods and Techniques (with emphasis on containment ponds)

<https://digitalcommons.unl.edu/cgi/viewcontent.cgi?article=1051&context=icwdmother> (accessed 03/12/24)

⁶ Bird Control Group, 2024. Agrilaser Handheld. <https://birdcontrolgroup.com/agrilaser-handheld/> (accessed 03/21/24)

- 19-36 The comment asks the use of tarps, rather than screens, would reduce the efficacy of the evaporation process. The use of tarps may impede the evaporation process for the brine; however, the determination of the appropriate use of bird deterrents—utilization of either tarps or screens—will be determined as part of the final design and engineering process. Only materials that would not hinder the efficacy of brine evaporation would be utilized.
- 19-37 The comment asks how the Program operation will ensure that toxic chemical generation is not exacerbated by the use of tarps or screens at the Solar Evaporation Ponds. This comment assumes that toxic chemicals would be generated by the brine. This is simply false. Refer to Response to Comment 19-26, which describes how BBARWA plans to address concerns with the evaporation ponds. Further, as previously stated, the brine quality will be monitored as part of the permit issued to BBARWA to operate the facility, and it must meet the regulatory standards therein. Thus, there is no possibility that the use of tarps or screens at the Solar Evaporation Ponds would exacerbate the generation of toxic chemicals.
- 19-38 The comment suggests that other regions utilize heat and indoor structures to manage brine, and asks why this wasn't considered by the Program. The comment may be referring to brine incineration, which is a more expensive alternative. The specifications of the Program are defined in the Project Description of the DPEIR, and the facilities therein were devised and designed with maximum feasibility in mind (refer to **Appendices 1, 2, and 20**, which describe how the proposed Program was devised). The commenter presents an option that will not be considered by this Program, as the overall cost, energy demand, time, and space involved with a system of this type would likely make the Program infeasible.
- 19-39 The comment asks what other options were considered for handling the brine generated by the AWP. As described in **Subsection 4.6.4: Brine Disposal – Solar Evaporation Ponds**, of the DPEIR, *“The most common brine concentrate disposal options include deep well injection (where permitted), surface water discharge (including the ocean), discharge to a wastewater treatment plant (such as via the Inland Empire Brine Line), land disposal, and solar evaporation or Zero Liquid Discharge with disposal of solids to a landfill.”* Most other projects similar to the Replenish Big Bear Program are near the ocean or are near an existing brine collection system, such as the Inland Empire Brine Line referenced in the comment extracted from the DPEIR, above. As such, where available and feasible, brine can be discharged into the ocean. Most projects that cannot discharge into the ocean utilize evaporation ponds. BBARWA is located in a mountainous area and doesn't have access to an existing brine collection system, so the use of Solar Evaporation Ponds is the most viable option. It is also the least costly option.
- 19-40 The comment asks what the criteria for determining the final depth and size for the evaporation ponds, and how this will affect operating the Solar Evaporation Ponds. The size (i.e., area) of the evaporation ponds depends on brine evaporation rates for the Big Bear Valley and the rate of input streams from the treatment process. Depth of the evaporation ponds is based on a minimum and maximum operating depth to allow for efficient evaporation and capacity for wet weather precipitation. Adequate freeboard (distance from max operating level to top of evaporation pond berm) must also be considered to mitigate overflowing from emergency operational scenarios or sloshing from earthquakes.

19-41 The comment asks how the Solar Evaporation Ponds will avoid brine from mixing with snow or water in Baldwin Lake. BBARWA's WDR brine permits would require the design of the Solar Evaporation Ponds to include free board that would inherently prevent any brine spillage. Flooding potential is analyzed under Subchapter 4.11, Hydrology of the DPEIR. As presented on page 4-694, the Solar Evaporation Pond would be installed to withstand flooding. Effectively, comparable to the area that is developed within BBARWA's existing WWTP, which has been built up to avoid the floodplain, the Solar Evaporation Ponds would be built up in this same manner to avoid the floodplain. As this has been successful in support of BBARWA's existing WWTP site operations, it is anticipated that in designing and constructing the Solar Evaporation Ponds above the floodplain, there would be no potential for Baldwin Lake floodwater or snow to mingle with the Solar Evaporation Pond brine. Refer also to the analysis pertaining to flood inundation and pollutant concentrations on page 4-700 of the DPEIR.

- 19-42 | - What measures will be taken if the monitoring wells determine that some of this brine water has soaked through to the groundwater?
- 19-43 | - How will the brine be collected in a way that does not damage the required liners in each of the ponds? How will it be determined that no damage has been done?
- 19-44 | - The evaluation on the aesthetics of these ponds ("Thus, as the Solar Evaporation Ponds would be located below grade, and as the change in visual setting would not be significant, this Program Component would have no potential to significantly alter a scenic vista.") -- is inaccurate, especially if tarps or screens are being utilized and especially as seen from Highway 18 to the north of the proposed ponds. The aesthetics evaluation requires that the facilities "(1) be located outside of scenic viewsheds identified in the General Plan or Municipal Code corresponding to a proposed location for a future facility; (2) be unobtrusive to scenic vistas due to height or blending the facility into the natural environment confirmed by a visual simulation that demonstrates this; or (3) where (1) or (2) are not possible, undergo subsequent CEQA documentation to assess potential aesthetic impacts a future Replenish Big Bear Program facility may have upon contain scenic resources." These ponds do not fit this criteria, nor is there any discussion about this being the case. How will these ponds be made to fit within these criteria? What changes will be made to the program plans and/or what mitigations will be offered to reduce this impact?
- 19-45 | - Have greenhouse emissions released by evaporation ponds been analyzed? How will this affect the air quality in the area?
- 19-46 | - If odor neutralizing materials must be used for mitigation of odors, what are the exact make-up and contents of those neutralizing materials? Have they been evaluated regarding whether they are in any way hazardous or harmful to humans or to the wildlife or environment of the area?
- 19-47 | - Studies show that Brine evaporation ponds work best in warm, dry climates (See Appendix, References 4 and 5). Has an actual live study been conducted in Big Bear to see if the evaporation ponds are a feasible plan with the current climate? What are the backup plans to be put in place if the climate is not warm or dry enough to assist in the evaporation process?
- 19-48 | - Have the significant impacts from the evaporation ponds on ground soil and surrounding soil been analyzed?
- 19-49 | - Baldwin Lake is defined in the PDEIR as a temporarily-to-seasonally flooded lake. How will the brine waters be kept from mingling with the Baldwin Lake flood waters if and when this flooding takes place?

Stanfield Marsh/Big Bear Lake Pipeline Options

- 19-50 | - If the Baldwin Lake pipeline alignment option has the potential to cause unavoidable significant impacts, and the Meadow Lane pipeline alignment option

- 19-42 The comment asks what actions will be taken if brine seepage is discovered by the monitoring wells. The SARWQCB and the permit it issues for the operation of the Solar Evaporation Ponds would stipulate the actions that BBARWA would take to remediate any unforeseen contamination. It would be speculative to determine the specific actions that the SARWQCB would require in the event of contamination, but given that the SARWQCB is the agency that regulates events of this type, the remediation would be required to be sufficient to meet its stringent requirements.
- 19-43 The comment asks how brine will be collected to prevent damage to the Solar Evaporation Pond liners. Protocols for the cleaning and maintaining Solar Evaporation Ponds will be developed to prevent any breaks. The manufacturer's recommendations and manual will be followed. In addition, the expected useful life of the evaporation pond is less than the brine removal frequency; therefore, the brine would be removed if the evaporation pond is replaced or decommissioned in the future.
- 19-44 The comment alleges that the aesthetics evaluation of the Solar Evaporation Ponds is inaccurate. The comment quotes **MM AES-2**, which applies to Replenish Big Bear Program facilities at unknown locations (i.e. the Sand Canyon Monitoring Wells), and is not applicable to the Solar Evaporation Ponds. **MM AES-2** utilizes parameters to ensure that the site selected for the Sand Canyon Monitoring Wells easily would avoid scenic vistas or undergoes an evaluation of potential impacts on scenic resources from implementation of the Sand Canyon Monitoring Wells themselves. The requirement for additional evaluation of potential impacts does not assume that a significant impact would occur for a project that would be located within an area containing scenic vistas, it simply requires an evaluation thereof. For the Solar Evaporation Ponds, these criteria in **MM AES-2** are not mandatory for a significant impact to be avoided for a given project, but in the case of the Solar Evaporation Ponds, a full aesthetics evaluation has been presented in the DPEIR that determined that the construction and operation of this project would not have a substantial adverse effect on a scenic vista. The Solar Evaporation Ponds would be developed within Baldwin Lake, of which portions could be considered scenic vistas, specifically those areas that are undisturbed and do not contain substantial urban/suburban development. As stated on page 4-20 of the DPEIR,

*“The Solar Evaporation Ponds that would be installed would also occur within the fence line of BBARWA’s treatment plant within the undeveloped area to the north and east-west of today’s active WWTP (refer to **Figure 3-26**). This area has been disturbed previously, but presently contains dirt and sparse vegetation as shown on **Photos 4.2-2 through 4.2-4**. The installation of Solar Evaporation Ponds within this area would alter the existing visual setting, but at present, the area is vacant and does not contain any scenic vistas internally within the site. Thus, the proposed Program would not result in a significant impact to scenic vistas that are internal to the BBARWA WWTP site from installation of the proposed Solar Evaporation Ponds, as none exist internally within the site. Note that an internal scenic vista would be a vista that occurs within a given project site.”*

To provide further context, this area falls within BBARWA’s existing WWTP, and has been previously disturbed. As illustrated best on **Figure 1-4**, the area in which the Solar Evaporation Ponds would be installed has been periodically in use as part of BBARWA’s operations. Thus, in addition to there being no internal scenic vistas, the installation of the Solar Evaporation Ponds would not significantly alter area scenic vistas because *“the installation of the Solar Evaporation Ponds within the BBARWA WWTP would be consistent with that which exists at present within the site”* (page 4-20 of the DPEIR). Thus,

the Solar Evaporation Ponds have been determined to be “unobtrusive to scenic vistas because the Solar Evaporation Ponds would blend into the existing environment associated with the BBARWA WWTP operations. Furthermore, as part of the discussions with the Yuhaaviatam of San Manuel Nation (YSMN), because the overall Baldwin Lake is an important part of the Tribe’s ancestral history, MM **TCR-5** would require consultation with the Tribe to address how the design elements of the Solar Evaporation Ponds can incorporate a natural-looking aesthetic in order to blend into the culturally significant Baldwin Lake landscape. Thus, BBARWA disagrees with the assertion that the evaluation of the Solar Evaporation Ponds was inaccurate pertaining to scenic vistas, as evidenced throughout this Response to Comment.

- 19-45 The comment asks whether greenhouse gas emissions released by the evaporation ponds have been analyzed and whether the air quality in the area would be impacted. The commenter appears to assume that the brine that is generated by the Advanced Water Purification Process would be toxic. As described on page 3-23 of the DPEIR “*Solar evaporation ponds rely on solar energy to evaporate water from the brine concentrate stream, leaving behind precipitated salts, which ultimately are disposed of in a landfill.*” Brine is not “sludge” or related to the existing wastewater treatment processes. The “sludge” and solids generated by the existing WWTP would be handled in the same manner that occurs as part of BBARWA’s existing WWTP operations.

Refer to Response to Comment 19-39, above. As described in **Subsection 4.6.4: Brine Disposal – Solar Evaporation Ponds**, of the DPEIR, “*The most common brine concentrate disposal options include deep well injection (where permitted), surface water discharge (including the ocean), discharge to a wastewater treatment plant (such as via the Inland Empire Brine Line), land disposal, and solar evaporation or Zero Liquid Discharge with disposal of solids to a landfill.*” Note the disposal options above, which include discharge to the ocean in some cases, because brine, as the term suggests, has salinity, and consists of total dissolved solids (TDS). TDS are not considered a “greenhouse gas” generating entity. The State Water Resources Control Board indicates that a “widely used methods for measuring salinity [is] Total Dissolved Solids (TDS)... TDS measures all dissolved substances, including organic and suspended particles, reported in milligrams per liter (mg/L).”⁷ Furthermore, BBARWA points the commenter to the GHG analysis, which evaluated operational emissions that would be generated by Program operation, including the operation of the Solar Evaporation Ponds. Operational emissions associated with the Solar Evaporation Ponds are discussed on pages 4-522 and 4-523 of the DPEIR, wherein it is determined that operational emissions sources for the Solar Evaporation Ponds would generate 0.10 metric tons of CO₂e per year, which, even when combined would not exceed the SCAQMD thresholds for greenhouse gas emissions. Additionally, Air Quality analysis analyzed the potential for sensitive receptors near individual Program sites to be impacted by project. Operational actions that could cause localized operational source emissions are discussed on page 4-155 of the DPEIR, wherein the Solar Evaporation Ponds were determined to not expose sensitive receptors to substantial pollutant concentrations and it was determined that impacts would be less than significant.

- 19-46 The comment asks what the contents of odor neutralization materials would be, in the event that odor neutralization is needed. The odor neutralizing materials specified by **MM**

⁷ State Water Resources Control Board, 2017. Groundwater Fact Sheet Salinity. https://www.waterboards.ca.gov/water_issues/programs/gama/docs/coc_salinity.pdf (accessed 03/06/24)

AQ-3 would be SCAQMD compliant. The use of hazardous materials in support of odor neutralization efforts would be prohibited as part of BBARWA's standard operating procedures.

- 19-47 The comment questions the use of Solar Evaporation Ponds in the mountainous climate of Big Bear Valley, and asks if there are any studies that have been conducted to demonstrate the efficacy of Solar Evaporation Ponds in this climate. BBARWA is currently measuring evaporation at the Solar Evaporation Pond site using a Class A Evaporation Pan. Calculations have been performed using evaporation data for Big Bear Lake from their Annual Watermaster Reports and precipitation and snowfall data from the Big Bear Valley. These calculations provide a safety factor to evaporation pond sizing for conservatism. Big Bear Valley averages about 300 days of sun per year. The Solar Evaporation Ponds will be designed to accommodate the rate of evaporation applicable to this region, inclusive of anticipated years in which the area receives below-average sunlight and warmth.
- 19-48 The comment asks whether impacts from the evaporation ponds on the soil and surrounding soils have been analyzed. BBARWA refers the reader to the description of the brine contents described under Response to Comment 19-45, above. The solar evaporation ponds would be lined with impermeable material so as to prevent contact with the underlying soils. This is described as part of the Project Description on page 3-74 of the DPEIR. As prevention is incorporated into the Solar Evaporation Ponds as a measure of design, soil contamination would be prevented, and no impacts to the underlying soils or area soils would be impacted by implementation of this component of the Program. In addition, as discussed in Response to Comment 19-27, under normal conditions, the pond will be continuously monitored and fed with brine, thereby keeping most of the brine solids submerged and protected from blow off.
- 19-49 The comment asks how the brine confined within the solar evaporation ponds would be kept from mingling with Baldwin Lake flood waters if/when flooding takes place. Refer to Response to Comment 19-41, above. Flooding potential is analyzed under Subchapter 4.11, Hydrology of the DPEIR. As presented on page 4-694, the Solar Evaporation Pond would be installed to withstand flooding. Effectively, comparable to the area that is developed within BBARWA's existing WWTP, which has been built up to avoid the floodplain, the Solar Evaporation Ponds would be built up in this same manner to avoid the floodplain. As this has been successful in support of BBARWA's existing WWTP site operations, it is anticipated that in designing and constructing the Solar Evaporation Ponds above the floodplain, there would be no potential for Baldwin Lake floodwater to mingle with the Solar Evaporation Pond brine. Refer also to the analysis pertaining to flood inundation and pollutant concentrations on page 4-700 of the DPEIR.
- 19-50 The comment asks why the Baldwin Lake Pipeline Alignment Option is being considered, even though it would result in significant and unavoidable impacts. The simple response is that this option is substantially less costly because it does not involve as much construction within roadway (i.e. asphalt removal and replacement), and would be less impactful on existing infrastructure. Furthermore, the other alignment option contains a number of existing underground infrastructure, making this option more crowded to access for installation of new pipeline. Thus, more than one pipeline option has been considered for the Stanfield Marsh/Big Bear Lake Discharge Project to allow for flexibility when determining the final design.

- 19-50 | does not, what is the reason and purpose behind continuing to consider the Baldwin Lake pipeline alignment as an option?
- 19-51 | - In the case that checkerblooms must be relocated, what analysis has been done on the survival and sustainability of those moved plants?
- 19-52 | - For the Baldwin Lake option, how large of a range of orange fencing around the Checkerbloom would be required to ensure no disturbance to the species or to its habitat so that it continues to thrive successfully?
- 19-53 | - If the checkerbloom habitat is disturbed what mitigations could be added to make up for this disturbance to the benefit of the checkerblooms? Could a conservation easement be put over this Baldwin Lake option area to assure protection into the future?
- 19-54 | - If the checkerblooms are transplanted or seeded, how will the location for the transplantation or seeding be determined to ensure their successful growth?

Stanfield Marsh/Big Bear Lake Discharge Project

- 19-55 | - Has the discharge water been evaluated against the Santa Ana Regional Water Quality Control Board requirements for discharge water? Does the discharge water meet those requirements? If not, what steps are planned to improve the discharge water to ensure that these requirements are met?
- 19-56 | - Does the program discharge water meet the standards of the Big Bear Lake Municipal Water District?
- 19-57 | - A full analysis of this project must be done and presented to the public and agencies when the actual data on the quality and contents of the program discharge water has been determined. What are the plans for this data and additional analysis being presented to the public?

Shay Pond Project and Stickleback Fish

- 19-58 | - How does the quality of the discharge water compare with the potable water that is currently feeding this pond? If it is less pure, what mitigations are planned to clear it prior to any usage?
- 19-59 | - Is a pilot test program planned with a small sampling of the UTS to assure that they can thrive in the discharge water? If not, why not?
- 19-60 | - What are the components of the additional CEQA analysis that would be required before this project can move forward?
- 19-61 | - The current system being used to maintain Shay Pond does not create the required outflow from the pond to Shay Creek. Would this project assure and

19-51 The comment questions whether the bird-foot checkerblooms can be moved successfully. First, regardless of whether the bird-foot checkerblooms can be moved successfully, BBARWA has identified the impacts to this species as significant and unavoidable. If the Baldwin Lake Pipeline Alignment Option is selected, **MM BIO-5** would be necessary to minimize impacts to the bird-foot checkerbloom species to the greatest extent feasible without avoiding this Alignment Option completely, but it would not fully mitigate the potential for the Baldwin Lake Pipeline Alignment Option to result in take of the bird-foot checkerbloom species. **MM BIO-5** would require the Baldwin Lake Pipeline Option to avoid bird-foot checkerbloom within the BBARWA WWTP site itself. Outside of the BBARWA WWTP Property, BBARWA would consult with the USFWS and CDFW as part of Section 7 Consultation and ITP obtainment, respectively. This consultation would result in additional mitigations to minimize impacts from the Baldwin Lake Pipeline Alignment Option on this species. Furthermore, BBARWA proposes an approach to mitigation for this species—if USFWS and CDFW concur—that would result in implementation of a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either: (a) replanted over the to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or, (b) replanted in BBARWA's established conservation area to protect the species in perpetuity.

In response to the successful movement of this plant species, the USFWS conducts a review every 5 years for listed species. The Endangered Species Act of 1973 requires the USFWS to review each listed species' status at least once every 5 years. The most recent 5-Year Review⁸ for *Sidalcea pedata* (bird-foot checkerbloom) concluded that the species remains endangered. The 5-Year Review recommends future actions to reduce threats to bird-foot checkerbloom, which includes the following applicable recommendation to the proposed Program:

1. Coordinate with landowners to identify opportunities for conservation on private lands. Work with private landowners, local governments, and conservation organizations to conserve, manage, and enhance habitat for *Sidalcea pedata*.

The USFWS has identified specific actions that can be taken to mitigate potential impacts to the bird-foot checkerbloom, and the applicability of those recommendations when applied to the proposed Program, is discussed below.

In regards to recommendation 1, through the implementation of **MM BIO-5**, USFWS would have the opportunity to work with BBARWA to conserve additional bird-foot checkerbloom habitat through transplanting the affected plants in place or to an existing conservation area within BBARWA's WWTP site, if agreeable to USFWS and CDFW as part of Section 7 consultation and obtainment of the ITP. It should be noted that BBARWA already maintains a conservation area within the WWTP site. Thus, BBARWA already contributes to the furtherance of recommendation 1, and through the implementation of **MM BIO-5**, the Program would have a potential to supplement the advancement of this goal.

⁸ USFWS, 2021. 5-Year Review, *Castilleja cinerea* (ash-gray paintbrush), https://ecos.fws.gov/docs/tess/species_nonpublish/3370.pdf (accessed January 10, 2024)

Furthermore, the comment letter BBARWA received from Dr. Tim Krantz (Comment Letter #15) evidences that bird-foot checkerbloom translocation can be successful. Refer to comments and Responses to Comments 15-9 through 15-11. BBARWA incorporated the feedback received by Dr. Tim Krantz into **MM BIO-5** to provide a more broad, experience based potential for the bird-foot checkerbloom species to survive the potentially significant transplant/translocation process that may result from implementation of the Baldwin Lake Pipeline Alignment Option APE. Refer to Response to Comment 15-11 for the revision made to **MM BIO-5** reflecting Dr. Tim Krantz's comments.

19-52 The comment asks how large of a range of orange fencing would be used to prevent disturbance of the checkerbloom. BBARWA is unsure of what "range" the commenter is referring to. Use of orange construction fencing around the bird-foot checkerbloom would occur around the entire extent of the species present within the Solar Evaporation Ponds and within the BBARWA WWTP site. The use of this fencing is common practice to protect plant species, and exclusion fencing is often utilized to keep special status wildlife species from entering the site. The fencing would remain in place for the duration of construction, and this would protect the species from construction related impacts. Furthermore, **MMS BIO-13 and BIO-16** would ensure that the protective MMs provided herein are successfully implemented for the duration of construction and operation of future Program facilities, and would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, including those that would be protected by orange exclusionary fencing, and would inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

19-53 The comment asks what mitigation could be added to make up for the disturbances to the bird-foot checkerbloom, and asks if a conservation easement could be placed over the Baldwin Lake Pipeline Alignment Option footprint to protect the species into the future. BBARWA does not own the parcels making up Baldwin Lake within which the Baldwin Lake Pipeline Alignment Option is proposed. As stated under Response to Comment 19-51, above, that BBARWA already maintains a conservation area within the WWTP site. The translocation program that has been proposed would need to be approved of by USFWS and CDFW as part of the **MM BIO-5**, would potentially replace the bird-foot checkerbloom in place and would place a conservation easement over top of the pipeline alignment, assuring protection of the species in this area in perpetuity. Alternatively, BBARWA could utilize its established conservation area within the WWTP site to translocate the plants for protection in perpetuity. Furthermore, Section 7 Consultation and the ITP obtainment process with CDFW would ensure that impacts to this species are mitigated to the greatest extent feasible, as stipulated by the consultation process with these agencies.

BIO-5 *Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:*

- ~~*At least 20 days prior to construction within areas containing the bird-foot checkerbloom, BBARWA shall notify USFWS and CDFW of the construction*~~

~~plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction. Due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, and an Incidental Take Permit (ITP) from CDFW shall be obtained.~~

- If neither CDFW nor USFWS opt to collect plants and/or plant seeds Subject to CDFW and USFWS concurrence, with the ultimate mitigation strategy to be approved by CDFW and USFWS prior to implementation, BBARWA shall proceed with the following approach to mitigate impacts to this species:
 - BBARWA shall ~~transplant the plants~~ implement a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either:
 - (a) replanted over the ~~to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or,~~
 - (b) replanted in BBARWA's established conservation area to protect the species in perpetuity.

19-54 The comment asks how the location for translocation or seeding of the bird-foot checkerbloom would be determined. The potential for seed collection is no longer being considered due to the need for Section 7 Consultation with USFWS and obtainment of an ITP from CDFW, which means that USFWS and CDFW would stipulate the terms of the mitigation necessary to minimize impacts to this species to the greatest extent feasible. If the mitigation approach proposed under **MM BIO-5** is approved by CDFW and USFWS, the location for conservation would ultimately determined in coordination with CDFW or USFWS staff.

19-55 The comment asks whether the Program Water has been evaluated against SARWQCB requirements. Please refer to Response to Comment 19-6. As stated therein, BBARWA temporarily installed a small-scale treatment system (referred to as the Pilot Study) to purify BBARWA's wastewater using the technology discussed in the DPEIR. A preliminary assessment was completed using the available information available at the time that the DPEIR was published. The impacts presented in the DPEIR were evaluated against this data and determined that, with the implementation of mitigation, impacts to water quality in the Big Bear Valley would be less than significant. BBARWA must comply with the SARWQCB requirements in order to operate, and therefore, will do so prior to operation of the facility.

19-56 The comment asks if the Program meets the standards of Big Bear Municipal Water District (BBMWD). BBMWD will use the standards that will be set by the SARWQCB. Currently, Big Bear Lake is subject to the Nutrient TMDL and Basin Plan WQOs. As discussed in Response to Comment 19-6, the Program is anticipated to meet these standards.

19-57 The comment requests the BBARWA release water quality data demonstrating that the Program Water can meet the applicable regulatory requirements. This data is already available and was presented in the DPEIR (refer to Response to Comment 19-6). As stated throughout these Responses to Comments, a pilot study was conducted to determine the quality of the Program Water (**Table 4.11-7**), and the impacts presented in

the DPEIR were evaluated against this data and determined that, with the implementation of mitigation, impacts to water quality in the Big Bear Valley would be less than significant. The Final Pilot Study will be completed in the summer of 2024, which will include all the final data that was collected.

- 19-58 The comment asks what the quality of the Program Water is in comparison to the potable water currently feeding Shay Pond, and request what mitigations would be planned to ensure that the water is of appropriate quality to support Stickleback. The anticipated quality of the Program Water is documented on **Table 4.11-7** on pages 4-460 through 4-461 of the DPEIR. An analysis of the impacts on surface water quality as a result of the Shay Pond Discharge is presented on pages 4-654 through 4-659 of the DPEIR. **Table 4.11-7**, specifically, compares the most stringent water quality objectives or criterion to the current BBCCSD potable water supply quality to the projected effluent quality of the proposed discharge to Shay Pond. The following is a quote from pages 4-654 through 4-657 of the DPEIR related to the quality of BBCCSD's water when compared against the Program Water quality:

*“Overall, the projected effluent quality of the proposed discharge to Shay Pond is better than the current potable water supply for chloride, hardness, sodium, sulfate, TDS, TN, aluminum, and specific conductance. This is evidenced by the results of the pilot project results presented in **Table 4.11-10**. The projected effluent quality of the proposed discharge is expected to be of similar quality as existing potable water supplies for ammonia, fluoride, MBAS, cadmium, copper, and lead. Boron may be the only constituent that could be above the existing potable water supply quality. The projected boron effluent quality of the proposed Shay Pond Discharge (0.11 mg/L) is anticipated to exceed Shay Pond ambient water quality (0.059 mg/L – based on one sample collected in November 2021), but remain well below the most stringent criterion of 0.75 mg/L for the protection of sensitive crops... The projected boron concentrations with the proposed Program Water discharge to Shay Pond are not estimated to exceed [the assimilative capacity for boron]. Thus, the water quality impacts related to boron would be less than significant because less than 10% of the assimilative capacity would be consumed.”*

The DPEIR determined that the use of Program Water at Shay Pond would not unreasonably affect beneficial uses, will not cause further exceedances of applicable WQOs, and is consistent with the maximum benefit to the people of the State. The mitigation measure proposed to ensure protection of the species is **MM BIO-6**. Should the Program Team ultimately decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**. Furthermore, should the impacts to the Stickleback fall outside the scope of that which has been analyzed in this DPEIR, preparation of a project-specific subsequent CEQA documentation would be required. **MM BIO-6** would be required to ensure the preparation of the additional studies that will be necessary to ensure that the product water is suitable to support Stickleback at Shay Pond. Therefore, should the Program Team decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**. The AMMP would identify any mitigations necessary to carry out the Shay Pond Discharge Project.

- 19-59 The commenter asks whether a pilot test program is planned with a small sampling of Stickleback to ensure that the species is protected. As discussed throughout these Responses to Comments, analysis of site-specific biological resource impacts can only occur once a site is identified or, in the case of Stickleback and the development of the

Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level (CEQA Guidelines §§15144, 15145). The Shay Pond Discharge Project, inclusive of the use of recycled water in support of the Stickleback, require implementation of an AMMP, which first requires an MOU with CDFW and USFWS, and then requires an approved AMMP in order to carry out the pilot study. The specifications of the pilot study will be determined through this process, as required by **MM BIO-6**. The Shay Pond Discharge Project shall only be carried out if CDFW and USFWS approve the AMMP before the start of the pilot study, which in and of itself would determine whether the change in water source for the Stickleback is feasible. In short, the planning and approval process that would be carried out in coordination with USFWS and CDFW would generate a set of requirements to which the pilot study and Shay Pond Discharge Project as a whole would adhere, which would result in full protection of the Stickleback.

19-60 The comment asks what components of the additional CEQA analysis would be required before the Shay Pond Discharge Project could move forward. It would be speculative to determine the scope of the CEQA analysis required to carry out the Shay Pond Discharge Project because the scope would be determined by future studies and surveys that have not yet been completed. The scope of the CEQA analysis would depend on whether new significant impacts are identified through these studies and surveys. The Program Team would be required to select the appropriate level of CEQA analysis based on these studies and surveys.

19-61 The comment asks if required 20 gpm outflow from Shay Pond will be maintained. Pled refer to Response to Comment 15-13. BBCCSD has provided the following context in Response to Comment 15-13 (paraphrased from an email dated February 29, 2024 with Jerry Griffith):

BBCCSD is required to maintain 20 gpm outflow from the pond. The pond was receiving more than enough water because of the above average winter snowfall and runoff, to the point that it was overflowing. BBCCSD recently found that someone blocked the outflow line by damming it up during its most recent clean up, which is why 20 gpm was not exiting the pond. BBCCSD was not able to see the dam that was created because it was underwater.

BBCCSD checks the pond weekly, sometimes more.

The above response from BBCCSD to this comment provides additional context that, while the 20 gpm outflow was not maintained for a short period of time, it was due to a manmade blockage that BBCCSD recently remedied. Further, it would appear that BBCCSD has maintained the pond area, and does so on a frequent basis. The 20 gpm outflow is presently maintained, and would continue to be maintained should the Shay Pond Discharge Project be implemented in the future.

- 19-61 | require that the full 20 gpm outflow from Shay Pond be maintained? How would
cont'd | this be measured and sustained?
- 19-62 | - What is the cost, both initially and annually of utilizing discharge water for Shay
| Pond versus the cost of the current system?
- 19-63 | - The PDEIR states that the overall impact to the UTS is expected to be beneficial.
| On what basis is that statement made if the actual contents of the program water
| and the comparison of that to the currently provided water is not known?
- 19-64 | - How and how often will the quality of the discharge water going into this pond
| and creek be measured and maintained?
- 19-65 | - The replacement pipeline in this Shay Pond project could cause significant
| impact to Southern Rubber Boa, but that impact is not counted because "this
| Shay Pond project is unlikely to move forward. Since it is still an option being
| considered, this document must take into account the circumstance of it actually
| moving forward. What mitigations are planned to protect the Southern Rubber
| Boa and to reduce the impact below significance in that case?

Additional Comments

- 19-66 | - For the Sand Canyon discharge option, have agreements been made with the
| Mountain Resorts to utilize this area and their existing systems for this project?
- 19-67 | - For the Sand Canyon discharge option, which agencies does that discharged
| water belong to? Would residents be required to pay additional fees for water
| due to this increase in their water availability?
- 19-68 | - The wet montane meadow habitat is a rare habitat found in Big Bear Valley but
| few other places. What mitigations are being proposed to protect that habitat
| itself, as opposed to just the individual species within it?
- 19-69 | - Are vibration and noise levels measured taking into account the effects on wild
| life, especially underground and terrestrial wildlife?
- 19-70 | - Have the potential hazards of the construction of the project to wildlife been
| evaluated for the deep ground disturbing elements of the program, such as
| pumps, compressors and drilling? What mitigations are being planned to reduce
| or eliminate these impacts?
- 19-71 | - The document states that the program area includes habitat for the San
| Bernardino flying squirrel. What mitigations are being proposed for any potential
| impacts to this species, especially for any potential nesting trees that may be cut
| in the program installation?
- 19-72 | - The PDEIR discusses the possibility of additional educational opportunities at the
| Stanfield Marsh. What are the details of these opportunities?

- 19-62 The comment asks what the cost is of utilizing Program Water in support of the Stickleback at Shay Pond. Economical considerations such as the cost of the Program fall outside of the scope of CEQA, and therefore, no further response to this comment is necessary. Additionally, this use of the Program Water is not planned to be pursued at this time.
- 19-63 The comment asks how the change in water source at Shay Pond could be beneficial to the Stickleback. Further, the comment alleges that the contents of the Program Water are not known. As stated throughout these Responses to Comments, a pilot study was conducted to determine the quality of the Program Water (**Table 4.11-7**), as such, the assertion that the quality of the Program Water is not known is untrue. In regards to the potential benefits to the Stickleback, this refers to the availability of 80 AF of water to support the species, which is in excess of the amount of water that is currently required to be discharged to Shay Pond. The provision of additional inflow could be beneficial to the species. Regardless, further study of the use of the Program Water to ensure protection of the Stickleback would be required through the implementation of **MM BIO-6**.
- 19-64 The comment asks how often the quality of the Program Water will be measured for use at Shay Pond. This would be determined by the implementation of the AMMP through the implementation of **MM BIO-6**. However, the quality of the Program Water would be monitored per the conditions contained in **MM HYD-1** for the purpose of ensuring the beneficial uses and water quality objectives of Stanfield Marsh, Big Bear Lake, and downstream uses are maintained. Once this component is implemented, the NPDES permit will also include monitoring requirements.
- 19-65 The comment conveys concern that the impacts related to the Shay Pond Discharge Project on biological resources were not properly disclosed. It is unclear to what the commenter is specifically quoting regarding impacts to this species. The analysis presented in the DPEIR on page 4-232 concludes that:

*“Due to the environmental conditions and existing disturbances within and adjacent the proposed Program Area footprint, as currently described, rubber boa is very unlikely to occur within the proposed Program Area footprint. Therefore, the proposed Program may affect, but is not likely to adversely affect this species. However, as described above, as there is some marginally suitable rubber boa habitat in the vicinity of the Shay Pond Discharge Project. As such, **MM BIO-10** is required to avoid a potentially significant impact on this species, and ensure that pre-construction southern rubber boa surveys are conducted to ensure avoidance of impacts to this species. Impacts to this species would be less than significant with the implementation of **MM BIO-10**.”*

Note that **MM BIO-10** requires that “if a rubber boa is found during preconstruction presence/absence surveys or during construction activities, all site-specific project activities shall be halted, CDFW shall be contacted, and a CESA Incidental Take Permit shall be obtained from CDFW prior to reinitiating project activities.” Thus, as the commenter asks how impacts would be mitigated, **MM BIO-10** would be sufficient to ensure that impacts would be reduced to a level of less than significant, even if the species is located during the preconstruction surveys.

- 19-66 The comment asks whether agreements with the Mountain Resorts have been secured to implement the Sand Canyon Recharge Project. BBLDWP has started the discussion with the Resorts. However, the agreements have not been executed.

- 19-67 The comment asks which agencies would own the water released at Sand Canyon. Once Program Water is pumped out of the Lake and released into Sand Canyon, it would recharge into the groundwater basin and become available as groundwater for BBCCSD and BBLDWP to meet water demands. Since water rights are not assigned for the groundwater basin and BBCCSD and BBLDWP do not own groundwater, agreements between the Program Partners would specify the amount of water recharged at Sand Canyon that is available to each agency.
- 19-68 The comment asks what protections have been incorporated into the Program to protect wet montane meadow habitat. Montane meadow habitat is analyzed as an indicator species throughout the analysis presented in DPEIR 4-204 through 4-259, and indirect impacts⁹ to this habitat are addressed therein. Implementation of **MMS BIO-14** through **BIO-25** would ensure that Program-related construction impacts, both direct, and indirect, to special status plant and wildlife species that rely on this habitat, are reduced to a level of less than significant. Furthermore, montane meadow habitats would be protected through the regulatory permitting requirements of the United States Army Corps of Engineers (USACE) 404 Permit, Regional Water Quality Control Board 401 Certification, and Fish and Game Code (FGC) Section 1602 Lake or Streambed Alteration Agreement processes. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. The regulatory agencies would stipulate additional protective measures deemed necessary to protect the habitats impacted by construction within jurisdictional features, which may include montane meadow habitat. Thus, montane meadow habitat would be protected as part of the existing mitigative protections outlined in the DPEIR.
- 19-69 The comment asks whether noise and vibration impacts on wildlife has been assessed. The noise and vibration analysis that was prepared for humans would also apply to wildlife. Furthermore, construction activities shall occur within the hours considered to be acceptable for construction by the applicable jurisdiction within which an individual project is constructed, except for activities, such as well drilling which are continuous, and for emergencies. Additionally, for both jurisdictions, construction is essentially limited to daytime hours, except in the event of an emergency, with slight variations attributed to each jurisdiction within which the Program falls. It would not be possible to further limit all construction to these hours, because well drilling requires 24-hour drilling, and furthermore, would be shielded from sensitive receptors during construction by noise barriers per **MM NOI-1**. The Program also requires implementation of **MM NOI-1**, which would required for nighttime monitoring well drilling activities at the Sand Canyon Recharge Area. With implementation of the barrier, noise levels would be reduced to a maximum noise level of 69 weighted decibels (dBA) equivalent sound level (Leq) at 50 feet.

⁹ Potential indirect impacts include, but are not limited to, erosion, soil compaction, increased siltation and sedimentation, fractures in the hardpan soils or rock outcroppings, alteration of jurisdictional water hydrology, dust aerosolization, host plant stress, destruction of native vegetation, habitat fragmentation, and noise and light pollution.

To the extent that heavy equipment may be necessary to complete projects contemplated by the Program, the proposed requirement to limit or further minimize noise or vibration during construction beyond that which was analyzed in the DPEIR—which was determined to be less than significant to human sensitive receptors—is not feasible, nor is it clear how imposing that limit would reduce impacts to biological resources during daylight hours.

- 19-70 The comment asks whether potential hazards of pumps, compressors, and drilling on wildlife have been evaluated in the DPEIR. The commenter is not specific on how these potential elements relate specifically to impacts on wildlife, and BBARWA is unsure of the manner in which the evaluation of the overall construction and operation of the Program on biological resources presented in the DPEIR on pages 4-164 through 4-308 would differ from an evaluation of individual components of the Program such as the pumps, compressors, and drilling referenced in this comment on biological resources. Thus, BBARWA believes that the DPEIR has fully analyzed the potential impacts on biological resources in the DPEIR by evaluating the individual issues required by CEQA to determine biological resource impacts.
- 19-71 The DPEIR asks what mitigation is proposed to protect San Bernardino flying squirrel (flying squirrel). Potentially suitable habitat for flying squirrel exists at the following locations in the Program Area (extracted from page 4-191):
- Sand Canyon Recharge Conveyance Pipeline
 - Sand Canyon Conveyance Pipeline Discharge Outlet
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option
 - North Airport Corridor Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option

Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, there is a moderate potential for flying squirrel to occur in the Program Area and species-specific impacts avoidance and minimization measures are recommended through **MMs BIO-11 and BIO-12**. **MM BIO-11** would require preconstruction surveys for each Program Component footprint, except for the BBARWA WWTP site as this site does not contain suitable habitat for this species, to identify potentially suitable cavity nesting sites and foraging habitat, prior to the removal of any trees or downed woody debris. Further, it would require coordination with CDFW including appropriate minimization and mitigation to be determined through the CDFW incidental take permit process, should cavity nesting sites be found during the preconstruction surveys. Furthermore, **MM BIO-12**, would require minimization of light pollution to protect nocturnal species, such as flying squirrel. Thus, protections for this species were identified as part of the biological resources analysis presented in the DPEIR, and mitigations were identified to ensure that impacts would be less than significant.

- 19-72 The comment asks what educational opportunities would be provided at Stanfield Marsh. This component of the Program is still in development, but at a high level, the education opportunities are envisioned to include signage and/or other means of communication to explain how the Program Water is treated before it is discharged into Stanfield Marsh and the benefits that it provides to the Marsh. This would complement the existing signage that are available to be installed at Stanfield Marsh educating visitors about the wildlife present.

19-73

Thank you again for the opportunity to comment on this PDEIR. We strongly urge BBARWA to take the time to reconsider aspects of this program and do full and proper analysis on the entire program once the actual data is available regarding the quality of the program discharge water. We would request that when the full evaluation can be and is completed based on actual live data, that this PDEIR be re-released to the public for comment.

Sincerely,

Sandy Steers
Executive Director

Drew Feldman, San Bernardino Valley Audubon

19-73 The comment urges BBARWA to reconsider aspects of this Program, but does not provide mention of what aspects of the Program are being referred to. Without more guidance as to which aspects of the Program the commenter believes should be reconsidered, BBARWA cannot provide further comment on this matter. The comment also requests that the quality of the Program Water should be fully disclosed and impacts should be analyzed against this data. Please refer to Response to Comment 19-6, above. The comment alleges that the contents of the Program Water are not known. As stated throughout these Responses to Comments, a pilot study was conducted to determine the quality of the Program Water and the water quality data generated by this study can be found in **Table 4.11-7**. As such, the DPEIR has already provided the data requested in this comment.

Comment Letter #20

February 20, 2024
 Sent via e-mail

Bridgette Burton
 Administrative Services Manager/Board Secretary
 Big Bear Area Regional Wastewater Agency
 P.O. Box 517
 121 Palomino Drive
 Big Bear City, CA 92314

**REPLENISH BIG BEAR PROGRAM (PROJECT)
 DRAFT PROGRAM ENVIRONMENTAL IMPACT REPORT (DPEIR)
 SCH#: 2022110595**

Dear Bridgette Burton:

20-1 The California Department of Fish and Wildlife (CDFW) received a Notice of Availability of a DPEIR from the Big Bear Area Regional Wastewater Agency (BBARWA) for the Project pursuant the California Environmental Quality Act (CEQA) and CEQA Guidelines.¹

20-2 Thank you for the extension to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife by February 20, 2024. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW ROLE

20-3 CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statute for all the people of the State. (Fish & G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

20-4 CDFW is also submitting comments as a **Responsible Agency** under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), the project proponent may seek related take authorization as provided by the Fish and Game Code.

PROJECT DESCRIPTION SUMMARY

Proponent: Big Bear Area Regional Wastewater Agency

¹ CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

**RESPONSE TO COMMENT
LETTER #20
CALIFORNIA DEPARTMENT OF FISH AND WILDLIFE**

- 20-1 The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 20-2 The comment is noted and will be made available to BBARWA decision-makers as part of FPEIR package prior to a decision on the proposed Program.
- 20-3 The comment notes that CDFW is California's Trustee Agency for fish and wildlife resources and its roles and responsibilities. The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 20-4 The comment notes that CDFW is a Responsible Agency under CEQA. The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

Project Location: The Project area is situated east/southeast of Big Bear Lake in the Big Bear Valley area of the San Bernardino Mountains (34.269977, -116.817334). Much of the proposed Project would be implemented within and around Big Bear City, however, Sand Canyon Recharge Area would be within the unincorporated community of Moonridge, which is south of Big Bear City. The proposed Project footprint is within both urban and natural/semi-natural environments. The Project area is situated within the Bear Valley and Baldwin Hydrologic Sub-Areas (HSA 801.71 and 801.73). The Bear Valley HSA comprises a 34,333-acre drainage area within the larger Santa Ana Watershed (Hydrologic Unit Code 18070203). The Baldwin HSA comprises a 22,789-acre drainage, also within the Santa Ana Watershed.

Project Objectives: The goal of the Project is to partner with local agencies (Big Bear Area Regional Wastewater Agency, Big Bear City Community Services District, City of Big Bear Lake Department of Water and Power, and Big Bear Municipal Water District) to recover local water that is currently being disposed of outside the Big Bear Valley to Lucerne Valley, close the water loop cycle, and keep the water in Big Bear Valley for beneficial reuse.

The original Project was developed in 2018, titled *Bear Valley Water Sustainability Project Final Draft Lake Alternative Evaluation*. Since 2018, some aspects of the Project have been modified, however, the objectives of the Project remain the same. Below are the following modifications to the 2018 plan that are proposed:

20-5

- Sustain Stanfield marsh habitat and increase educational opportunities,
- Enhance Big Bear Lake benefits,
- Expand local water supplies, and
- Sustain unarmored threespine stickleback fish with Project water.

Currently, wastewater generated within the Big Bear Valley undergoes preliminary and secondary treatment and undisinfected secondary effluent is discharged to BBARWA's 480-acre site in Lucerne Valley (LV). To keep water in Big Bear Valley, the following projects are proposed: BBARWA Wastewater Treatment Plant (WWTP) Upgrades Project, Solar Evaporation Ponds Project, Stanfield Marsh/Big Bear Lake Discharge Project, Sand Canyon Recharge Project, Shay Pond Discharge Project, and LV Site Discharge Reduction. Major activities regarding these projects would include the installation of about 6.59 miles of various types of conveyance pipelines, installation of up to four monitoring wells at the Sand Canyon Recharge Project and the Solar Evaporation Ponds Project, installation of up to three pump stations at the BBARWA WWTP Project, construction of 23-57 acres of solar evaporation ponds at the BBARWA WWTP site, improvements to include 2.2 million gallons per day of full advancement treatment to produce up to 2,200 acre feet per year of Project water, and the installation of 2 megawatt solar panels.

Timeframe: The project is expected to be implemented from January 2025 through January 2027, with year-round work.

COMMENTS AND RECOMMENDATIONS

20-6

CDFW has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (i.e., biological resources). CDFW is concerned about the adequacy of the DPEIR in identifying potentially significant impacts and establishing adequate and enforceable mitigation measures. CDFW's comments and recommendations to assist the BBARWA in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct, indirect, and cumulative impacts on fish and wildlife (biological) resources on the DPEIR are explained in greater detail below.

Project-Related Environmental Impacts and Effective Mitigation Measures

- 20-5 The comment provides a description of the Program location, Program objectives, and Program Description. The summary description of the Program provided in this comment is accurate.
- 20-6 The comment summarizes CDFW's jurisdiction over biological resources, and raises concerns regarding the DPEIR's adequacy in identifying or mitigating the proposed project's significant, or potentially significant impacts to biological resources, and points to CDFW's recommendations in the forthcoming comments. The proposed project is analyzed on a programmatic level, with project specific analysis for those individual Program components that have been defined in enough detail to perform a project level analysis. As such, some specific project-level detail has not yet been determined. The analysis and level of detail contained in the environmental document "need not be greater than that of the program, plan, policy, or ordinance being analyzed." (CEQA Guidelines § 15152(b); see also CEQA Guidelines § 15152(c).) Once the project-level details for those Program components that have not yet been defined in sufficient detail to perform a project-level analysis are determined, any additional impacts (direct, indirect, and cumulative) will be identified through subsequent CEQA documentation (if required) and the appropriate, project-specific mitigation will be identified and applied at that time. Note that the DPEIR indicates the following on page 4-164, the start of Subchapter 4.5 Biological Resources, in relation to the level of analysis for this topic:

"The analysis herein, while prepared under a Programmatic DEIR, has been provided at the project level for all of the facilities proposed under this Program, with ~~one~~ two exceptions: the monitoring wells at Sand Canyon as the specific locations of the monitoring wells is presently unknown. Additionally, the specific impacts on the Stickleback resulting from the change in water source proposed by the Program have not been forecasted in detail because this Program components will not be implemented in the short-term. However, the procedure by which impacts to this species from changing the water source at Shay Pond to advanced treated water must be analyzed in the future to are provided herein. Sufficient detail for all other projects proposed under this Program is available for project level impact forecasts."

The mitigation measures identified in the DPEIR would ensure that CDFW will have an opportunity to review and consult with the Implementing Agency of each facility at the project-specific level, and safeguards that mitigation may be added or modified accordingly to ensure impacts are mitigated to the greatest extent possible.¹⁰

¹⁰ See **MMs BIO-6, BIO-7, BIO-13, BIO-20, BIO-26, and BIO-28**, which each require consultation and compliance with CDFW

A EIR must analyze and disclose all direct and reasonably foreseeable indirect impacts on the environment caused by the proposed Project. An EIR must also identify potentially feasible mitigation measures that avoid or reduce each significant impact to the extent feasible.

- 20-7 The DPEIR describes the intent of the document as follows: “*This document assesses the impacts, including unavoidable adverse impacts and cumulative impacts, related to the construction and operation of the Program. This DPEIR is also intended to support the permitting process of all agencies from which discretionary approvals must be obtained for particular elements of this Program*” (DPEIR, p. 1-19). Such analysis would allow CDFW to provide specific input on the adequacy of the analysis, and whether that analysis was sufficient for use in future discretionary actions, such as Fish and Game Code section 1602 Lake and Streambed Alteration Agreements or Fish and Game Code section 2081 Incidental Take Permits. However, the DPEIR does not identify or adequately assess impacts to biological resources, and in most cases defers this analysis to some future action. Many of the biological mitigation measures in the DPEIR (e.g., BIO-7, BIO-10, BIO-11, BIO-13, BIO-21, BIO-27) defer assessment of project-related environmental impacts and development of avoidance, minimization, and measures to the future. Furthermore, the minimum required compensatory mitigation for habitat loss indicated in measures such as BIO-7 and BIO-26, at a 1:1 mitigation ratio, is insufficient to reduce impacts to less than significant. At a minimum, a 2:1 mitigation ratio should be indicated to compensate for habitat loss due to Project-related impacts.
- 20-8 Although the DPEIR includes Mitigation Measures BIO-1 to BIO-29, CDFW considers these measures insufficient in timing and scope to reduce impacts to less than significant.
- 20-9

- 20-10 If the DPEIR will defer biological analyses to future, second tier environmental analysis, the DPEIR should specify the threshold that will be relied on for requiring additional environmental review, and which of the projects contemplated will be required to complete additional environmental review. If the threshold for triggering additional environmental review is low, or if additional environmental reviewed is not anticipated, CDFW requests that the lead agency recirculate this DPEIR and include the results of an appropriate level of analysis for which CDFW may rely on for future discretionary actions. Regardless of the Lead Agency’s approach for analyzing specific biological impacts, the DPEIR must address the ‘whole of the action’, **as it is inappropriate under CEQA review to divide a project into smaller, separate projects**. The DPEIR must address the cumulative effects of the Project as a whole.

Bird-foot Checkerbloom

- 20-11 In the case of direct impacts that are anticipated to bird-foot checkerbloom (*Sidalcea pedata*), the DPEIR acknowledges (p. 4-216), “*Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the proposed Solar Evaporation Ponds footprint at the BBARWA WWTP.*” Further stating, “*There is also suitable montane meadow habitat for this species within the possible Shay Pond Replacement Pipeline, as well as immediately adjacent the Shay Pond Conveyance Pipeline alignment and Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program. Given that bird-foot checkerbloom is present within the proposed Program Area footprint, the Program may affect this species and construction of the proposed Solar Evaporation Ponds, as currently described, is likely to adversely affect this species. Thus, in order to avoid an adverse effect on this species, mitigation is necessary that would fully reduce impacts to a level of less than significant.*” However, the DPEIR states the full extent of bird-foot checkerbloom and other special-status plant species, and subsequent mitigation, cannot be determined for a given Project component and instead defers these assessments to pre-construction surveys which would occur 20 days prior to construction. CDFW reiterates that bird-foot checkerbloom is listed as an endangered species under both the California Endangered Species Act (CESA) and the federal

20-7 The commenter raises concerns that the DPEIR's does not identify or adequately address impacts to biological resources and defers impacts to a future action. The DPEIR has performed project-specific analysis and project specific site surveys for every Program component that have been defined in sufficient detail to forecast impacts. Detailed site surveys were performed for the following Program Components:

- BBARWA WWTP Upgrades Project
- Solar Evaporation Ponds Project
- Stanfield Marsh/Big Bear Lake Discharge Project (all alignment options)
- Sand Canyon Recharge Conveyance Pipeline (excepting the portion of the alignment that traverses through private property)
- Sand Canyon Conveyance Pipeline Discharge Outlet
- Sand Canyon Booster Station
- Shay Pond Conveyance Pipeline Alignment

The only areas where surveys could not be performed are described on page 4-202 of the DPEIR:

- Shay Pond Replacement Pipeline
 - Page 4-202 states the following regarding the survey of this pipeline alignment, *“it is anticipated that the reuse of the existing pipeline from BBARWA extending almost the entire distance to Shay Pond will be possible. As this existing pipeline alignment is anticipated to be viable, the Shay Pond Replacement Pipeline alignment (Figures 4.5-7 through 4.5-8) was not surveyed because the Program Team does not currently anticipate that the installation of this pipeline will be necessary. The existing pipeline from BBARWA extending almost the entire distance to Shay Pond is belowground, and as such, its use would not cause any aboveground impacts that could affect special status species, habitats, jurisdictional features, or other biological resources. BBARWA expects that the existing pipeline that extends from the BBARWA WWTP to Shay Pond, which is presently not in use, will be sufficient to convey purified water from the AWWPF at BBARWA's WWTP to the proposed short length of pipeline to Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8). Thus, given that the existing pipeline is anticipated to be sufficient to serve the Shay Pond Discharge Project, the Shay Pond Replacement Pipeline is not anticipated to be necessary and as a result, the Shay Pond Replacement Pipeline alignment was not surveyed.”*
- Sand Canyon Recharge Conveyance Pipeline on private property
 - Page 4-202 states the following regarding the survey of this pipeline alignment, *“Approximately 350 LF of the Sand Canyon Recharge Conveyance Pipeline (Figure 4.5-5) would be constructed between two houses, which would require an easement. Permission from the property owners of these two private residences was not obtained at the time of survey. Therefore, this section of the Sand Canyon Recharge Conveyance Pipeline was not surveyed.”*
- Sand Canyon Monitoring Wells
 - Although the general location of these monitoring wells is known, the site specific locations are unknown.

Analysis of site-specific biological resource impacts can only occur once a site is identified or defined in sufficient detail in the planning process to be analyzed at a site-specific level (CEQA Guidelines §§15144, 15145). As required in Section 15168 of the CEQA Guidelines, specific findings were made based on the sensitivity of known resources in

the Big Bear Valley, and specific mitigation measures were identified to address specific types of impacts.

Further, the comment appears to argue that the referenced mitigation measures constitute deferral since they involve preconstruction surveys; however, these mitigation measures do not constitute deferral. A lead agency may rely on future studies to devise the specific design of a mitigation measure when the results of later studies are used to tailor mitigation measures to fit on-the-ground environmental conditions. (See *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 524 [upholding mitigation measures, based on preconstruction surveys, requiring identified steps for avoiding impacts to biological resources implemented].) Here, **MMs BIO-7, BIO-10, BIO-11, BIO-13, and BIO-27** require preconstruction surveys. These preconstruction surveys are not feasible to conduct now as they are designed to reflect the current conditions of the Program sites directly prior to ground disturbing activities so the mitigation measures can effectively mitigate any biological impacts. Further, the majority of these mitigation measures require the completion of preconstruction surveys prior to any ground disturbing activities and invoke specific and enforceable standards in cases where these surveys determined certain species were located at the Program site, as well as the individuals responsible for performing those actions. These mitigation measures are proper because they commit BBARWA to mitigation and set out standards to follow. (See, e.g., *Clover Valley Foundation v. City of Rocklin* (2011) 197 Cal.App.4th 200, 244.) Thus, **MMs BIO-7, BIO-10, BIO-11, BIO-13, and BIO-27**, which involve future studies and preconstruction surveys, do not constitute deferral.

- 20-8 The comment suggests that the minimum requirement for compensatory mitigation should be greater than 1:1. The commenter does not provide documentation indicating why 2:1 compensatory mitigation would reduce impacts to a level of less than significant, but a level of 1:1 mitigation would not. It should be noted that in both instances referenced in this comment (**MMs BIO-7 and BIO-26**), CDFW, USFWS, and/or other regulatory agencies would have the ultimate say in the level of compensatory mitigation required, and thereby would be the authority determining what level of compensatory mitigation is necessary to reduce impacts to a level of less than significant. Therefore, BBARWA believes that the use of 1:1 mitigation as a starting point from which to negotiate compensatory mitigation is valid, as it would offset impacts at an equal level to the area of impact. However, in an effort to collaborate with CDFW, BBARWA has considered CDFW's recommendations and shall modify **MMs BIO-7 and BIO-26** to reflect what BBARWA believes is the intent of the requested mitigation revisions made in this comment (revisions are shown in underline and strikeout):

BIO-7 *Prior to implementation of the Sand Canyon Monitoring Wells (once the final locations have been selected), and prior to the replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8), a site-specific biological resources assessment shall be conducted by a qualified biologist familiar with Big Bear Valley flora and fauna. This survey shall be conducted in accordance with appropriate standards by a qualified biologist/ ecologist. If sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the California Natural Diversity Database (CNDDB) will be notified and the following subsequent mitigation actions will be taken:*

a. *BBARWA shall provide compensation for sensitive habitat acreage lost by acquiring and protecting in perpetuity (through property or mitigation bank*

credit acquisition) habitat for the sensitive species at a ratio of not less than 1:1 for habitat lost, with the ultimate compensatory mitigation ratio being determined through negotiation with USFWS and/or CDFW, and never less than 1:1. The property acquisition shall include the presence of at least one animal or plant per animal or plant lost at the development site to compensate for the loss of individual sensitive species.

- b. The final mitigation may differ from the above values based on negotiations between the project proponent and USFWS and CDFW for any incidental take permits for listed species. BBARWA and/or the implementing agency shall retain a copy of the incidental take permit as verification that the mitigation of significant biological resource impacts at a project site with sensitive biological resources has been accomplished.*
- c. Preconstruction botanical surveys for special-status plant communities and special-status plant species will be conducted in areas that were not previously surveyed because of access or timing issues or project design changes; pre-construction surveys for special-status plant communities and special-status plant species will be conducted before the start of ground-disturbing activities during the appropriate blooming period(s) for the species. If special-status plants or plant communities are identified, the following hierarchy of actions shall be taken: a) find an alternative site; b) avoid the plants and maintain them onsite after completing the project; or c) provide compensatory mitigation offsite.*

BIO-26 *Any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation. Mitigation can be provided by restoration of temporary impacts, enhancement of existing resources, or purchasing into any authorized mitigation bank or in-lieu fee program; by selecting a site of comparable acreage near the site and enhancing it with a native riparian habitat or invasive species removal in accordance with a habitat mitigation plan approved by regulatory agencies; or by acquiring sufficient compensating habitat to meet regulatory agency requirements. ~~Typically, regulatory agencies require mitigation for~~ Impacts to jurisdictional waters ~~without any riparian or wetland habitat shall to~~ be mitigated at a minimum 1:1 ratio, with the ultimate compensatory mitigation ratio being determined through negotiation with regulatory agency, and never at a rate of less than 1:1. ~~For loss of any riparian or other wetland areas, the mitigation ratio will begin at 2:1, and~~ ~~the ratio will rise based on the type of habitat, habitat quality, and presence of sensitive or listed plants or animals in the affected area. This increase in ratio will be determined by the regulatory agency, and must be deemed sufficient by the regulatory agency issuing the permit to compensate for/offset the impacts to the jurisdictional waters and supported species and habitats therein.~~ A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.*

The above modification constitutes a modification to a mitigation measure that does not require recirculation pursuant to CEQA Section 15073.5(c). The above measure would be equal to or more effective than that which was incorporated into the DPEIR.

20-9 CDFW alleges that **MMs BIO-1 through BIO-29** are insufficient in timing and scope to reduce impacts to a level of less than significant, but does not describe what specifically is insufficient in timing and scope in this comment. Without more specific guidance, BBARWA is unable to respond to this comment further. However, it should be noted that CEQA Statute 15126.4(a)(1)(B) states that *“Formulation of mitigation measures should not be deferred until some future time. However, measures may specify performance standards which would mitigate the significant effect of the project and which may be accomplished in more than one specified way.”* The Replenish Big Bear Program DPEIR creates real performance standards through mitigation to be met by the Implementing Agency for a given project. Many mitigation measures set a performance standard that a future project can either meet or otherwise, if it cannot meet the performance standard, would require subsequent project-specific CEQA evaluation to allow a final determination on each future project’s specific impacts. This approach is deemed appropriate and consistent with the utilization of a program environmental document in accordance with Sections 15162 and 15168 of the State CEQA Guidelines. Furthermore, as discussed in Response to Comment 20-7, **MMs BIO-7, BIO-10, BIO-11, BIO-13, and BIO-27**, which involve future studies and preconstruction surveys, do not constitute deferral. Ultimately, the Replenish Big Bear Program DPEIR has provided comprehensive mitigation measures designed to mitigate potential environmental impacts that may occur from Program implementation at the site specific and programmatic level.

20-10 The comment states that the DPEIR should specify the threshold that will be relied on for requiring additional environmental review and which of the projects contemplated will be required to environmental review. Further, the comment requests that if the threshold is low or if additional environmental review is not anticipated, then recirculation is requested. Lastly, the comment states that it is inappropriate under CEQA review to divide a project into smaller, separate projects and cumulative effects of the Project must be addressed.

This DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components. (State CEQA Guidelines §15168(c)(1)–(2), (5).) However, project-level details are provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and, the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdle that would be necessary to modify the water source supporting the Stickleback. Impacts will be quantitatively addressed in project-specific second tier environmental evaluations once specific aspects of the Program are proposed for implementation and designed. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level.

20-11 This comment references text in the DPEIR pertaining to the bird-foot checkerbloom, and alleges that the DPEIR *“states the full extent of bird-foot checkerbloom and other special-status plant species, and subsequent mitigation, cannot be determined for a given Project component and instead defers these assessments to pre-construction surveys which would occur 20 days prior to construction.”* BBARWA disagrees with CDFW’s interpretation of the procedure by which impacts were evaluated and mitigated in the DPEIR. The DPEIR included site specific surveys of the areas referenced under Response

to Comment 20-7, which measured the extent to which bird-foot checkerbloom was present during the time that the Program footprint was surveyed (June and July of 2022 and made a follow-up survey visit in July of 2023 [ref. Page 4-201 of the DPEIR]). However, based on CDFW's own guidelines, site surveys are valid for approximately a one year period, and as such would require updating to verify the findings prior to Program implementation that is anticipated to occur between January 2025 and January 2027. Thus, the mitigation measures that have been proposed for the Program to minimize impacts to this and other special status plant and animal species include pre-construction surveys for both areas that have been identified as containing special status plant species or as containing habitat for special status animal special, in addition to those areas that, based on site condition, may be suitable to support special status plant and animal species.

Furthermore, Response to Comment 15-12 from Dr. Tim Krantz recommended that **MM BIO-5** be revised based on his experience with a successful transplantation of bird-foot checkerbloom in place. BBARWA concurs with the concept proposed in this comment, detailed in comments 15-9 and 15-10, and as a result, **MM BIO-5** has been modified to provide a more broad, experience based potential for the bird-foot checkerbloom species to survive the potentially significant transplant/translocation process that may result from implementation of the Baldwin Lake Pipeline Alignment Option APE. Additionally, **MM BIO-5** has been modified to address the need for Section 7 consultation as well as ITP obtainment from CDFW, which are necessary due to the federal nexus for the Program related to the obtainment of grants from the Bureau of Reclamation, EPA Community Grants, and EPA WIFIA, as well as grant opportunities being pursued from other federal and/or state agencies. Refer to Response to Comment 20-12 for further background on the impact analysis pertaining to bird-foot checkerbloom.

The site specific surveys found presence of bird-foot checkerbloom within the Baldwin Lake Pipeline Alignment Option and Solar Evaporation Ponds footprints as shown on **Figure 4.5-10** from the DPEIR. However, the DPEIR determined that there are suitable montane meadow habitat to support this species Shay Pond Replacement Pipeline, immediately adjacent the Shay Pond Conveyance Pipeline alignment, and Stanfield Marsh Conveyance Pipeline Discharge Outlet, hence the requirement for the implementation of **MM BIO-7** to confirm that this species is absent or mitigate impacts to the species if found to be present in these areas. **MM BIO-7** specifies the actions that must be followed in order to verify the presence or absence of sensitive species. This **MM** requires compensatory mitigation for impacts to special status habitats and species, requires consultation with CDFW and/or USFWS where special status species would be impacted and incidental take permit(s) required, and requires preconstruction botanical surveys for special status plant communities with a hierarchy of actions that shall be taken to avoid a significant impact thereof. BBARWA is unsure where CDFW has gained the impression that pre-construction surveys would occur 20 days prior to construction, as this is not included in any of the mitigation measures incorporated into the DPEIR, but as referenced above, the suggestion that pre-construction surveys would be utilized as the sole means by which to minimize significant impacts on special status plants, habitats, and species, is simply incorrect.

20-11 cont'd | Endangered Species Act (ESA). Consequently, impacts to the species must be fully analyzed during preparation of environmental documents relating to CEQA under CEQA Guidelines §15125 (c) and/or §15380.

In addition, losses of bird-foot checkerbloom plants and habitat would constitute a significant impact under CEQA that must be mitigated. Although the DPEIR includes mitigation measures BIO-1, 3, 4, and 5, CDFW is concerned that these measures are insufficient in scope and timing to reduce impacts to less than significant. CDFW recommends the following mitigation measure be added to a revised DPEIR:

MM BIO-[A]: Compensatory Mitigation for Impacts to Bird-foot Checkerbloom

20-12 | **Prior to construction activities within areas containing bird-foot checkerbloom, Big Bear Area Regional Wastewater Agency shall either fully avoid the plant(s), with an appropriate buffer established by a qualified botanist and marked in the field (i.e., fencing or flagging), or mitigate the loss of the plant(s) through the purchase of mitigation credits from a CDFW-approved bank, or the acquisition and conservation of land approved by CDFW at a minimum 3:1 (replacement-to-impact) ratio.**

Pursuant to the CEQA Guidelines, section 15097(f), CDFW has prepared a draft mitigation monitoring and reporting program (MMRP) for CDFW-recommended MM-BIO [A] through [F] (see Attachment 1).

Unarmored Threespine Stickleback

20-13 | In the case of direct impacts that are anticipated to unarmored threespine stickleback, the DPEIR defers an impact analysis due to the uncertainty of executing the pipeline to Shay Pond, stating (p. 4-231), "*The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Stickleback. The purified water generated by the AWPF at BBARWA, proposed under this Program, could potentially significantly impact the species, if the water source lacks the nutrients necessary to support the species, or contains any constituents that, when introduced into the Stickleback habitat, would adversely impact the species. The impacts to this species were analyzed on a more programmatic level, so that, should the individual project go forward in the future, mitigation would stipulate the steps necessary to minimize impacts from changing the water source at Shay Pond.*" However, the DPEIR determined that (p. 4-250), "*should the impacts to the Stickleback fall outside the scope of that which has been analyzed in this DPEIR, preparation of a project-specific subsequent CEQA documentation would be required.*" Although the DPEIR includes BIO-6, this measure defers assessment of impacts to unarmored threespine stickleback and development of an adaptive management and mitigation plan to the future. CDFW reiterates that unarmored threespine stickleback is listed as an endangered species under both CESA and ESA and is a CDFW Fully Protected species. Consequently, impacts to the species must be fully analyzed during preparation of environmental documents relating to CEQA under CEQA Guidelines §15125 (c) and/or §15380.

Other Special-Status Species

20-14 | Additionally, according to the DPEIR (p. 4-205), "*Construction of any Program facility should only result in mostly minimal impacts on special-status wildlife species, because only a limited amount of marginal habitat for special-status wildlife species could be impacted by construction activities. The location where most of the proposed Program facilities will be installed or constructed occurs within built-up land, or otherwise disturbed locations (such as BBARWA's WWTP, etc.), and thus construction would potentially impact special-status wildlife species that use mostly urban/developed*

20-12 The comment conveys that losses of bird-foot checkerbloom would be significant and unavoidable, and conveys that **MMs BIO-1, 3, 4, and 5** are insufficient to reduce impacts to a level of less than significant. First, it is important to note that the DPEIR has identified the impacts on the bird-foot checkerbloom as a significant and unavoidable impact should the Baldwin Lake Pipeline Alignment Option be the selected Stanfield Marsh/Big Bear Lake Discharge Alignment Option. Thus, CDFW is correct in stating that losses of bird-foot checkerbloom plants and habitat would constitute a significant impact under CEQA. Based on the site specific surveys, and habitat of the Program footprint, loss of bird-foot checkerbloom is not anticipated to occur as a result of the remaining Program components (other than from the Baldwin Lake Pipeline Alignment Option). For the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**), as discussed under Response to Comment 20-11, **MM BIO-7** stipulates the threshold by which the mitigation measures are triggered (in this case, it is a location based threshold), and appropriate avoidance, minimization, and mitigation necessary to ensure a less than significant impact would occur. For the Stanfield Marsh Conveyance Pipeline Discharge Outlet, **MM BIO-2** would require preconstruction clearance surveys to verify the findings contained in the Biological Resources Assessment (BRA). However, in order to ensure that, in the event that bird-foot checkerbloom is found within this footprint, **MM BIO-2** shall be modified to incorporate what BBARWA believes is the intent of the additional mitigation measure contained in this comment (revisions are shown in underline and strikeout):

BIO-2 *Preconstruction clearance surveys shall be conducted by a qualified biologist who is familiar with the local flora, to determine if any special status plant species are present within the proposed disturbance area prior to construction of any individual Program component. Botanical surveys shall be conducted during the appropriate time of year, when target species are both evident and identifiable.*

Should any special status plants be located within the area of potential effect (APE) during the preconstruction survey (excluding the Baldwin Lake Pipeline Option), the Implementing Agency shall fully avoid the plant(s) in accordance with the provisions of MM BIO-3 or due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, if the species is federally listed, or an Incidental Take Permit (ITP) from CDFW shall be obtained. Subject to CDFW and/or USFWS concurrence, the Implementing Agency shall mitigate the loss of the plant(s) through the purchase of mitigation credits from a CDFW-approved bank, or the acquisition and conservation of land approved by CDFW at a minimum 1:1 (replacement-to-impact) ratio.

The intent of the above modification is to protect special status plant species that may appear within the Program APE in areas that were identified as containing suitable habitat to support special status plants during the biological site surveys performed in 2022 and 2023, but were determined to be absent from the Program APE as a result of site-specific surveys. BBARWA believes that, with the above changes to **MM BIO-2**, potential impacts to bird-foot checkerbloom and other special status plant species within future Replenish Big Bear Program sites—with the exception of the Baldwin Lake Pipeline Alignment Option, for which a significant and unavoidable impact was identified—will be mitigated to the greatest extent feasible. Furthermore, **MM BIO-1** would minimize the potential for the Solar Evaporation Ponds to impact bird-foot checkerbloom as a result of Program implementation, because it will result in full avoidance of the species as part of Program construction and operation. **MM BIO-3** would even further minimize the potential for bird-

foot checkerbloom because an onsite biologist would be present to ensure that exclusionary fencing is erected in the event that the extent of the species is found outside of the limits shown on **Figure 4.5-10**, and is therefore avoided as part of construction activities, and would be avoided as part of operational activities. **MM BIO-4** is not directed at protection of bird-foot checkerbloom, but rather, would protect other special status species through exclusionary fencing if discovered during construction activities, thereby resulting in avoidance of impacts thereof.

Response to Comment 15-12 from Dr. Tim Krantz recommended that **MM BIO-5** be revised based on his experience with a successful transplantation of bird-foot checkerbloom in place. BBARWA concurs with the concept proposed in this comment, detailed in comments 15-9 and 15-10, and appreciates that Dr. Tim Krantz has suggested a potential program that could be successful in the commenter's own experience, as there are few examples to draw from in the Valley given the uniqueness of these species to the Valley. As a result, **MM BIO-5** has been modified as follows (revisions are shown in underline and strikeout):

BIO-5 *Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:*

- ~~At least 20 days prior to construction within areas containing the bird-foot checkerbloom, BBARWA shall notify USFWS and CDFW of the construction plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction. Due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, and an Incidental Take Permit (ITP) from CDFW shall be obtained.~~
- If neither CDFW nor USFWS opt to collect plants and/or plant seeds Subject to CDFW and USFWS concurrence, with the ultimate mitigation strategy to be approved by CDFW and USFWS prior to implementation, BBARWA shall proceed with the following approach to mitigate impacts to this species:
 - BBARWA shall transplant the plants implement a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either:
 - (a) replanted over the to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or,
 - (b) replanted in BBARWA's established conservation area to protect the species in perpetuity.

Furthermore, modifications to **MM BIO-5** have been made to address the need for Section 7 consultation as well as ITP obtainment from CDFW, which are necessary due to the federal nexus for the Program related to the obtainment of grants from the Bureau of Reclamation, EPA Community Grants, and EPA WIFIA, as well as grant opportunities being pursued from other federal and/or state agencies. The intent of the above modification is to provide a more broad, experience based potential for the bird-foot checkerbloom species to survive the potentially significant transplant/translocation process that may result from implementation of the Baldwin Lake Pipeline Alignment

Option APE. BBARWA believes that, with the above changes to **MM BIO-5**, potential impacts to bird-foot checkerbloom from the implementation of the Baldwin Lake Pipeline Alignment Option, for which a significant and unavoidable impact was identified, will be mitigated to the greatest extent feasible; however, the determination that impacts to this species would be potentially significant and unavoidable remains. These Responses to Comments demonstrate that the DPEIR has not underestimated potential biological resource impacts.

20-13 This comment alleges that the impacts to the Unarmored Threespine Stickleback (Stickleback) are improperly deferred and are not fully analyzed as part of the DPEIR. BBARWA disagrees with the assessment that impacts to the Stickleback species are improperly deferred. The DPEIR properly truncated project-specific analysis for Stickleback because site-specific investigations have not yet begun because the proposed project is at a conceptual level of planning. Analysis of site-specific biological resource impacts can only occur once a site is identified or, in the case of Stickleback and the development of the Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level (CEQA Guidelines §§15144, 15145). The Shay Pond Discharge Project, inclusive of the use of recycled water in support of the Stickleback, would not be able to be implemented without input from the USFWS and CDFW, or without USFWS and CDFW approval of the AMMP, once developed. As such, BBARWA stands by the impact analysis that determined that impacts to the Stickleback would be less than significant with the implementation of mitigation because the Shay Pond Discharge Project would simply not be able to go forward without USFWS and CDFW authorization per **MM BIO-6**, which states *"The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible."* In short, the planning and approval process that would be carried out in coordination with USFWS and CDFW would generate a set of requirements to which the pilot study and Shay Pond Discharge Project as a whole would adhere, which would result in full protection of the Stickleback.

20-14 The comment quotes the DPEIR, and draws a conclusion that the DPEIR impact analysis was conducted under the assumption that special status species do not utilize urban areas. However, within the quote abstracted from the DPEIR, the DPEIR states that "construction would potentially impact only the special-status wildlife species that use mostly urban areas," which acknowledges that future Replenish Big Bear Program projects may impact special status species and habitat, including the species referenced in this comment (San Bernardino flying squirrel and bald eagle). Furthermore, for a majority of the Program footprint, site specific biological surveys were performed, meaning that the potential for special status species to occur within the Program area was based on site-specific knowledge of the Program footprint. The potential for each special status species with a potential to occur in the Program area has been assessed for each individual Project proposed under the Program on pages 4-206 through 2-240 of the DPEIR. BBARWA stands by the assessment of potential suitable habitat for these species found in the DPEIR. CDFW appears to have overlooked the site specific data that was presented in the DPEIR in favor of the more general statement that was made in the quote referenced in this comment. These Responses to Comments, as a whole, demonstrate that the DPEIR has not underestimated potential biological resource impacts.

20-14
cont'd areas." Adjacency to urban areas does not necessarily determine habitat value or the use of these areas by special-status species. CDFW is concerned that the DPEIR has trivialized the significance of the Project's potential impacts on special-status species that could use such areas. Many special-status species, including San Bernardino flying squirrel (*Glaucomys sabrinus californicus*) and bald eagle (*Haliaeetus leucocephalus*), often utilize disturbed areas such as residential neighborhoods and isolated habitats (Mazzella 2019, Brylski 1998, Jackman et al. 2004), that could be directly and/or indirectly impacted by the Project. Impacts to special-status species, regardless of habitat quality or location, must be identified, evaluated, and mitigated to a level below significance.

Analysis of Cumulative Effects to Biological Resources

Groundwater

20-15 The DPEIR bases its analysis of cumulative impacts to groundwater and groundwater dependent ecosystems on the Groundwater Sustainability Plan (GSP, Appendix 8) prepared pursuant to the Sustainable Groundwater Management Act for the Bear Valley Basin (prepared January 2022). The GSP indicates that under the Project, the groundwater currently used for discharge to Shay Pond will instead be stored in the Basin and that recycled water from an existing wastewater treatment plant will be used for discharge to the pond. Shay Pond provides important habitat for unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*). The GSP does not consider impacts to the unarmored threespine stickleback resulting from the change in water source used for discharge to Shay Pond. Many studies have linked effluent from wastewater plants to physiological and reproductive abnormalities in fish species (Jenkins et al. 2009, Fuzzen et al. 2015, McCallum et al. 2019, Hamdhani et al. 2020). Wastewater effluent often contains high levels of nutrients and reduced dissolved oxygen levels. Contaminants such as pharmaceuticals, personal care products, plastic by-products, and pesticides may not be adequately removed by wastewater treatment processes (McCallum et al. 2019). Estrogenic and other contaminants that occur in wastewater are known to disrupt the hormone systems of fish (Johnson and Sumpter 2001, Jenkins et al. 2009, Fuzzen et al. 2015, Hicks et al. 2017, Marjan et al. 2018, McCallum et al. 2019, Hamdhani et al. 2020). One of the most widely reported consequences is "intersex," a condition in which both male and female characteristics exist in the same fish. This condition can result in lower reproductive success (Jenkins et al. 2009, Fuzzen et al. 2015, Hicks et al. 2017). The GSP indicates that the recycled water will be "high quality" (GSP, p. 62); however, no data on the chemical and physical characteristics of the recycled water have been provided to substantiate the quality of the recycled water. Additionally, the DPEIR nor the GSP provide provisions for monitoring unarmored threespine stickleback to assess whether there are effects from exposure to the recycled water that could be discharged to Shay Pond.

20-16 Thus, CDFW recommends the Lead Agency consider impacts to the unarmored threespine stickleback resulting from the change in water source used for discharge to Shay Pond. CDFW recommends that the DPEIR include the following: (1) Data on the chemical characteristics of the recycled water to be used for the Project, including contaminants likely to result in hormone disruption of fish species, as well as other contaminants such as those provided in the analysis of groundwater quality given in Table 4-1 of the GSP; (2) Data on the physical characteristics of the recycled water that are likely to impact fish species, such as water temperature, dissolved oxygen, and pH; (3) A comparison of water quality for the recycled water versus the groundwater currently being used to discharge to Shay Pond to ascertain if the change in water source would introduce contaminants that may impact the reproduction and survival of unarmored threespine stickleback; and (4) A provision for ongoing monitoring of water quality of the recycled water before it is discharged to Shay Pond. **If the quality of the recycled water may pose a threat to the reproduction and survival of unarmored threespine stickleback, CDFW recommends that the Lead Agency reconsider whether it is appropriate to use recycled water to sustain endangered species**

20-15 This comment pertains to the cumulative analysis of groundwater and groundwater dependent ecosystems, specifically in relation to Stickleback and alleges that the DPEIR relies on the Groundwater Sustainability Plan (GSP) as a tool by which to measure such impacts. It is unclear what CDFW is referencing when it alleges that the GSP was utilized to measure impacts to Stickleback. The GSP is not mentioned by name in the entirety of Subchapter 4.5, which pertains to the analysis of biological resources, including Stickleback, and furthermore is not utilized as a reference by which impacts to Stickleback are analyzed or justified in the DPEIR as CDFW suggests in this comment.

This comment also alleges that the “no data on the chemical and physical characteristics of the recycled water have been provided to substantiate the quality of the recycled water.” The water quality impacts at the Shay Pond location are discussed in section 4.11 of the DPEIR. In addition, Appendix 19 contains preliminary water quality that was available during the development of the DPEIR and collected as part of the pilot study. A pilot study was conducted in order to predict the quality of the Program Water will be, and the substantiating data regarding the quality of the water is documented in Subchapter 4.11, Hydrology and Water Quality on pages 4-637 through 4-463 of the DPEIR, and specifically BBARWA directs CDFW to refer to **Table 4.11-7** on pages 4-460 through 4-461 of the DPEIR, which outlines the projected average effluent quality of proposed discharge. Regardless of the availability of Pilot Study water quality data, pursuant to **MM BIO-6**, as modified by Response to Comment 20-16 below, BBARWA believes that the methods stipulated by **MM-BIO-6** are necessary to ensure full protection of this species. Thus, as water quality data is only one component in evaluating the impacts of utilizing Program Water in support of Stickleback at Shay Pond, additional data would be necessary to carry out the change in water source at Shay Pond.

BBARWA acknowledges the studies the comment references pertaining to wastewater effluent impacts on fish species; however, as discussed under Response to Comment 20-13, impacts to the Stickleback would be less than significant with the implementation of mitigation because the Shay Pond Discharge Project would simply not be able to go forward without USFWS and CDFW approval per **MM BIO-6**, which states “*The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.*” In short, the planning and approval process that would be carried out in coordination with USFWS and CDFW would generate a set of requirements to which the pilot study and Shay Pond Discharge Project as a whole would adhere, which would result in full protection of the Stickleback.

20-16 Please refer to Responses to Comments 20-13 and 20-15, above, which respond to the concerns raised in this comment that the use of Program Water in support of Stickleback should be fully analyzed at a project-level in the DPEIR. BBARWA agrees with CDFW in regards to the data that should be gathered prior to implementing the Shay Pond Discharge Project component of the Replenish Big Bear Program. However, as previously stated, analysis of site-specific biological resource impacts can only occur once a site is identified or, in the case of Stickleback and the development of the Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level (CEQA Guidelines §§15144, 15145). BBARWA reiterates that the Shay Pond Discharge Project would simply not be able to go forward without USFWS and CDFW approval per **MM BIO-6**. In short, the planning and approval process that would be carried out in coordination with USFWS and CDFW would generate a set of requirements to which the pilot study and Shay Pond Discharge Project as a whole would adhere, which would result in full

protection of the Stickleback. In order to incorporate CDFW's recommendations, BBARWA proposes to modify **MM BIO-6** as follows (revisions are shown in underline and strikeout):

BIO-6 *In order to change the water source at Shay Pond, an AMMP shall be developed by BBARWA. The implementing agency—BBARWA, in association with BBCCSD—shall coordinate with USFWS and CDFW to obtain verbal agreement on the approach to forecast impacts to the Stickleback. Then, the implementing agency or biologist familiar with the Stickleback contracted to the implementing agency shall draft a MOU (that would be between BBARWA and/or BBCCSD and USFWS and/or CDFW) to lay a solid framework for the development of an AMMP. The MOU will determine if additional permitting will be required from both the State and Federal government for the take of an endangered species.*

The AMMP shall identify a sampling and monitoring program for the lifespan of the Program. This will include any triggers or adaptive management strategies that could be implemented to improve conditions for the Stickleback, including alterations to water temperature, inclusion of bubblers to increase dissolved oxygen or other techniques to be identified. The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.

As part of the MOU and AMMP implementation process, BBARWA, in association with BBCCSD shall obtain the following data to be provided to CDFW and/or USFWS:

- *Data on the chemical characteristics of the Program Water to be used for the Project;*
- *Data on the physical characteristics of the Program Water that are likely to impact fish species, such as water temperature, dissolved oxygen, and pH;*
- *A comparison of water quality for the Program Water versus the groundwater currently being used to discharge to Shay Pond to ascertain if the change in water source would introduce contaminants that may impact the reproduction and survival of the stickleback.*

The above modification constitutes a modification to a mitigation measure that does not require recirculation pursuant to CEQA Section 15073.5(c). The above measure would be equal to or more effective than that which was incorporated into the DPEIR.

BBARWA would also like to point out that this comment recommends “A provision for ongoing monitoring of water quality of the recycled water before it is discharged to Shay Pond,” which is already identified as part of **MM BIO-6**, as seen above.

20-16
cont'd

habitat at Shay Pond. If, after analyzing the quality of the recycled water, the Lead Agency concludes it is appropriate to use for discharge to Shay Pond, the Lead Agency should be prepared to monitor unarmored threespine stickleback for effects from the change in water source. A monitoring plan should be developed, in conjunction with CDFW and the U.S. Fish and Wildlife Service, prior to commencing discharge of recycled water to Shay Pond. The plan should incorporate adaptive management and a provision for reverting to groundwater for discharge to Shay Pond should unarmored threespine stickleback be negatively impacted by exposure to the recycled water from the wastewater treatment plant.

Monitoring Wells

20-17

The DPEIR states (p. 4-960), “*The location of future specific projects proposed under the Program are well-defined, with the exception of the Sand Canyon Monitoring Wells, which do not have a defined location, beyond being located downstream of the Sand Canyon Recharge Area.*” CDFW is concerned that the lack of information regarding the location of the Sand Canyon monitoring wells could pose a threat to biological resources, including groundwater. Monitoring wells can provide a pathway for the movement of poor-quality water, pollutants, contaminants, and especially significant threat to groundwater quality if they are not properly placed, constructed, altered, and maintained². **CEQA is predicated on a complete and accurate description of the proposed Project. Without a complete and accurate project description, the DPEIR likely provides an incomplete assessment of Project-related impacts to biological resources.** CDFW recommends a recirculated DPEIR include the proposed locations for the Sand Canyon monitoring wells and an analysis of any cumulative impacts that could result from the placement of the wells. These impacts should include any adverse effects to adjacent riparian habitat and perennial and intermittent water sources in the vicinity.

California Endangered Species Act

20-18

CESA prohibits the take (under Fish & G. Code, § 86, “take” means to hunt, pursue, catch, capture, or kill, or to attempt to hunt, pursue, catch, capture, or kill) of any endangered, threatened, or candidate species that results from a proposed project, except as authorized by state law (Fish & G. Code, §§ 2080, 2085). Consequently, if Project construction or any Project-related activity during the life of the proposed Project would result in take of a CESA-listed species, CDFW recommends that the Project applicant seek appropriate take authorization under CESA prior to implementing the proposed Project. Appropriate authorization from CDFW may include an Incidental Take Permit (ITP), a consistency determination, or other permitting options (Fish and G. Code, §§ 2080.1, 2081, subs. (b), (c)). CESA ITPs are issued to conserve protect, enhance, and restore state-listed CESA species and their habitats. More information on ITPs can be found at: <https://wildlife.ca.gov/Conservation/CESA/Permitting/Incidental-Take-Permits>.

The DPEIR acknowledges that several species listed under CESA have the potential to occur in or near the Project area (Appendix 12, p. 71-91); however, the DPEIR defers ITP consideration to the time of pre-construction surveys. **CDFW recommends early consultation because significant modification to the proposed Project and avoidance, minimization, and mitigation measures may be necessary to obtain a CESA ITP.** Proposed avoidance, minimization, and mitigation measures must be sufficient for CDFW to conclude that the Project’s impacts are fully mitigated.

Nesting Birds

² California Department of Water Resources. Monitoring Well Standards, Introduction. <https://water.ca.gov/Programs/Groundwater-Management/Wells/Well-Standards/Combined-Well-Standards/Monitoring-Introduction#:~:text=Groundwater%20monitoring%20wells%20are%20principally,to%20as%20%22observation%20wells.%22>

20-17 The comment conveys concern related to the Sand Canyon Monitoring Wells, as the locations for these wells has not yet been identified, and alleges that impacts cannot be forecast without the provision of the location for the Program infrastructure. As discussed throughout the responses to this comment letter, specifically under Responses to Comments 20-6, 20-7, 20-9, and 20-13, the proposed project is analyzed on a programmatic level, with project specific analysis for those individual Program components that have been defined in enough detail to perform a project level analysis. The analysis and level of detail contained in the environmental document “need not be greater than that of the program, plan, policy, or ordinance being analyzed.” (CEQA Guidelines § 15152(b); see also CEQA Guidelines § 15152(c).) For the Monitoring Wells at Sand Canyon, once the project-level details for those Program components that have not yet been defined in sufficient detail to perform a project-level analysis are determined, the impacts will be analyzed against the analysis contained in the DPEIR, and any additional impacts (direct, indirect, and cumulative) will be identified through subsequent CEQA documentation (if required) and the appropriate, project-specific mitigation will be identified and applied at that time.

The Sand Canyon Monitoring Wells would be installed downstream of the Sand Canyon Recharge Area, and are not anticipated to be installed in undisturbed areas. In addition, the monitoring wells will be installed properly and maintained. BBARWA and the Program Team intend to select sites that avoid sensitive biological resources to the greatest extent feasible. Furthermore, as the general location for the Sand Canyon Monitoring Wells is known, an analysis of the potential habitats and special status species that could occur in this general area has been incorporated into the DPEIR. The DPEIR identified **MMs BIO-10, BIO-11, and BIO-12** that are specific to the Sand Canyon Recharge Project, and are intended to minimize impacts to Southern Rubber Boa, San Bernardino flying squirrel, and California spotted owl (SPOW), in addition to the mitigation measures applicable to each Program component (**MMs BIO-13 through BIO-25**). Additionally, BBARWA proposes to modify **MM BIO-7** to include an explicit requirement for site specific surveys at the Sand Canyon Monitoring Well sites, once selected. Refer to Response to Comment 20-8, which includes the revisions referenced herein.

20-18 This comment outlines the provisions of the California Endangered Species Act (CESA) and recommends that the Implementing Agency consult with CDFW in the early stages of the Program component where an incidental take permit (ITP) is anticipated to be necessary. At this time, based on the site specific biological surveys performed for the Program in 2022 and 2023, no ITPs are anticipated to be necessary; however, the comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

CDFW is concerned that the mitigation measures proposed in the DPEIR are insufficient to ensure that impacts to nesting birds are mitigated to a level less than significant. It is the Project proponent's responsibility to comply with all applicable laws related to nesting birds and birds of prey. Fish and Game Code sections 3503, 3503.5, and 3513 afford protective measures as follows: Fish and Game Code section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by Fish and Game Code or any regulation made pursuant thereto. Fish and Game Code section 3503.5 makes it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by Fish and Game Code or any regulation adopted pursuant thereto. Fish and Game Code section 3513 makes it unlawful to take or possess any migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act of 1918, as amended (16 U.S.C. § 703 et seq.).

20-19 The DPEIR (p. 4-289) indicates that "construction may cause adverse impacts on migratory species through disturbing or harming nesting birds." CDFW is concerned about the impacts to nesting birds including loss of nesting/foraging habitat and potential take from ground-disturbing activities and construction. Conducting work outside the peak breeding season is an important avoidance and minimization measure. CDFW also recommends the completion of nesting bird surveys *regardless* of the time of year to ensure that impacts to nesting birds are avoided. The timing of the nesting season varies greatly depending on several factors, such as bird species, weather conditions in any given year, and long-term climate changes (e.g., drought, warming, etc.). In response to warming, birds have been reported to breed earlier, thereby reducing temperatures that nests are exposed to during breeding and tracking shifts in availability of resources (Socolar et al., 2017). CDFW staff have observed that climate change conditions may result in nesting bird season occurring earlier and later in the year than historical nesting season dates. CDFW recommends that disturbance of occupied nests of migratory birds and raptors within the Project site and surrounding area be avoided any time birds are nesting on-site. CDFW therefore recommends the completion of nesting bird surveys *regardless of the time of year* to ensure compliance with all applicable laws pertaining to nesting and migratory birds.

CDFW appreciates the inclusion of MM BIO-28; however, the measure is insufficient in timing and scope to reduce impacts to nesting birds to a level less than significant. CDFW recommends a revised DPEIR include specific avoidance and minimization measures to ensure that impacts to nesting birds do not occur. Project-specific avoidance and minimization measures may include, but are not limited to, Project phasing and timing, monitoring of Project-related noise (where applicable), sound walls, and buffers, where appropriate. CDFW recommends that disturbance of occupied nests of migratory birds and raptors within the Project site be avoided **any time birds are nesting on-site**. Preconstruction nesting bird surveys shall be performed within 3 days prior to Project activities to determine the presence and location of nesting birds. CDFW recommends BBARWA include the following mitigation measure in a revised DPEIR:

20-20

MM BIO-[B]: Pre-Construction Nesting Bird Surveys

Regardless of the time of year, nesting bird surveys shall be performed by a qualified avian biologist no more than 3 days prior to vegetation removal or ground-disturbing activities. Pre-construction surveys shall focus on both direct and indirect evidence of nesting, including nest locations and nesting behavior. The qualified avian biologist will make every effort to avoid potential nest predation as a result of survey and monitoring efforts. If active nests are found during the pre-construction nesting bird surveys, a qualified biologist shall establish an appropriate nest buffer to be marked on the ground. Nest buffers are species specific and shall be at least 300

- 20-19 The comment conveys concern regarding the mitigation measures, specifically mitigation pertaining to nesting birds, and outlines law pertaining to the protection of nesting birds and birds of prey. The comment also recommends completion of nesting bird surveys regardless of the time of year, citing climate change conditions resulting in earlier nesting seasons. The response to this recommendation can be found in Response to Comment 20-20, below.
- 20-20 The comment recommends revisions to **MM BIO-28**, which pertains to the protection of nesting birds. CDFW suggests that prior to commencing construction for any facility proposed under the proposed project, and for any time of year, that a nesting bird survey should be required, regardless of the site location, and available habitat for nesting birds to be present. BBARWA respectfully disagrees with this requirement, particularly given that a portion of the proposed Program would occur within developed sites, such as the BBARWA WWTP, at which the potential for nesting birds is negligible. BBARWA agrees that there is evidence to suggest that nesting birds may be present outside of nesting season. However, BBARWA believes that the determination for whether a nesting bird survey should be required outside of nesting season should be left to a qualified biologist to determine whether the survey is appropriate based on the given project site conditions. Thus, BBARWA has agreed to amended **MM BIO-28** in the FPEIR to include more specific requirements to protect nesting birds in part, which is addressed as follows (revisions are shown in underline and strikeout):

BIO-28 *To avoid an illegal take of active bird nests, any grubbing, brushing or tree removal will be conducted outside of the State identified nesting season for applicable bird species (nesting season is approximately from February 15 through September 15 of a given calendar year, depending on the species). ~~Alternatively~~ Additionally, at the discretion of a qualified avian biologist, nesting bird surveys shall be required, where appropriate, regardless of the time of year shall be conducted by a qualified avian biologist no more than three (3) days prior to vegetation clearing or ground disturbance activities.*

- *Preconstruction surveys shall focus on both direct and indirect evidence of nesting, including nest locations and nesting behavior. The qualified avian biologist will make every effort to avoid potential nest predation as a result of survey and monitoring efforts. If no active nests are found, no further action would be required. If an active nest is found, the biologist shall set appropriate no-work buffers around the nest which would be based upon the nesting species, its sensitivity to disturbance, nesting stage and expected types, intensity, and duration of disturbance. There are no standard nest buffers specified in the MBTA or within the FGC. Disturbance factors including nest location, human activity, activity duration, and noise level may influence nesting behavior and reproductive success, shall be considered by the project biologist in coordination with CDFW and USFWS (as appropriate) in establishing standard buffer distances for individual species on a project- and site-specific basis. The nest(s) and buffer zones shall be field checked weekly by a qualified biological monitor. The approved no-work buffer zone shall be clearly marked in the field, within which no disturbance activity should commence until the qualified biologist has determined the young birds have successfully fledged and the nest is inactive.*
- *Preconstruction nesting bird surveys shall include a nighttime component to address the potential for presence of nocturnal species. The nesting bird surveys shall consist of a minimum of five (5) consecutive survey days and shall include an additional three (3) consecutive nights of survey for nocturnal species. Nocturnal surveys shall be conducted between the hours*

of 9:00 pm. and midnight, during appropriate weather conditions (e.g., no rain or winds).

- *Vegetation removal, including any tree removal or pruning, and structure demolition shall be conducted outside the typical nesting season (i.e., between September 1st and January 31st), to the maximum extent feasible. Otherwise, the provisions of the preconstruction nesting bird surveys, above, shall suffice to ensure impacts to nesting birds are minimized.*

The above modification constitutes a modification to a mitigation measure that does not require recirculation pursuant to CEQA Section 15073.5(c). The above measure would be equal to or more effective than that which was incorporated into the DPEIR.

20-20
cont'd

feet for passerines and 500 feet for raptors. A smaller or larger buffer may be determined by the qualified biologist familiar with the nesting phenology of the nesting species and based on nest and buffer monitoring results. Construction activities may not occur inside the established buffers, which shall remain on site until a qualified biologist determines the young have fledged or the nest is no longer active. Active nests and adequacy of the established buffer distance shall be monitored daily by the qualified biologist until the qualified biologist has determined the young have fledged or the Project has been completed. The qualified biologist has the authority to stop work if nesting pairs exhibit signs of disturbance.

Bald Eagle

20-21

Consistent with CEQA Guidelines, Section 15380, the status of the bald eagle as an endangered species under the California Endangered Species Act (Fish & G. Code, § 2050 *et seq.*) and as a Fully Protected species (Fish & G. Code, § 3511) qualify these species as endangered, rare, or threatened species under CEQA.

Vegetation removal may impact eagles that use large trees for nesting and cover (Zeiner et al. 1990). Additionally, vegetation clearing can cause habitat loss, fragmentation, and create edge effects that permeate far beyond the Project site (Harris 1988, Murcia 1995). Roads can be a source of mortality for raptors, and they have also been shown to decrease reproductive success of eagles (Anthony and Isaacs 1989, Varland et al. 1993, Trombulak and Frissell 2000). Noise from road use, generators, and other equipment may be disruptive to nesting and hunting eagles, and exposure to vehicle noise has been shown to increase stress hormone levels in some raptor species. The level of impact depends on how close the road is to nest site, how much use it gets, and how accustomed any particular breeding pair is to road noise. Artificial light may attract or disorient nesting eagles (Longcore and Rich 2004). It can also suppress the immune system of birds. Therefore, Project impacts on bald eagle and golden eagle would be potentially significant.

The DPEIR acknowledges that bald eagle nesting habitat has been identified in the Project area. CDFW is concerned that the timing and scope of the mitigation measures are insufficient to reduce impacts to a level less than significant. To ensure avoidance of impacts to this Fully Protected species, CDFW recommends that focused breeding surveys be conducted for nesting bald eagles in the Project area using appropriate protocols. CDFW recommends inclusion of the following mitigation measure:

MM-BIO-[C]: Bald Eagle Breeding Surveys

20-22

Prior to adoption of the CEQA document and prior to Project activities, a qualified biologist shall conduct focused breeding surveys for bald eagle, following appropriate protocols: CDFW's Bald Eagle Nesting Territory Survey Form and Instructions (2010) and USFWS Protocol for Evaluating Bald Eagle Habitat and Populations in California (2004) or more current guidance from USFWS. If helicopters are used, only one helicopter survey will occur, and additional surveys will be conducted via ground observations. The helicopter must stay 200 meters away from any potential nest sites (i.e., cliffs, treetops, platforms, etc.). If an active nest is discovered, do not stop for more than 5-10 seconds to determine status. If follow-up helicopter surveys are required to get closer to any potential or confirmed nests, Big Bear Area Regional Wastewater Agency should contact CDFW about potentially issuing a Memorandum of Understanding (MOU). Data collected during the nesting season surveys shall include the following: territory status (unknown, vacant, occupied, breeding successful, breeding unsuccessful); nest location, nest elevation; age class of eagles observed; nesting chronology; number of young at each

- 20-21 The comment outlines law pertaining to the protection of bald eagle, and details the type of activities that could impact bald eagle. Further, this comment alleges that Project impacts on golden eagle and bald eagle would be potentially significant, however it does not point to any specific activity proposed by the Program that would support this determination beyond the description of general activities that could impact these species. Importantly, bald eagle and golden eagle habitat must be present for the activities listed in this comment to impact these species. Please note that habitat for golden eagle was determined to be absent from the Program area, so the reference in this comment to this species is confusing, as the commenter does not point to evidence that this species would be found within the Program area. The Program footprint was surveyed for potential bald eagle habitat, and the only area of the Program that has a potential to support this species is Baldwin Lake, within which BBARWA's WWTP is located, and within which the Baldwin Lake Pipeline Alignment Option is proposed. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program site, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. CDFW provides recommendations for additional protections to this species in comment 20-22, which is responded to below.
- 20-22 Please refer to Response to Comment 20-21, above. The comment conveys concern regarding the mitigation measures protecting bald eagle (BAEA) provided in the DPEIR and provides a suggested mitigation measure intended to minimize impacts to this species. BBARWA acknowledges the importance of protecting bald eagle as part of Program implementation. However, CDFW does not provide evidence that nor does it provide a reason why the mitigation measure (**MM BIO-9**) is "insufficient to reduce impacts to a less than significant level." Based on a thorough review of the Program area, the Program biologist determined that *"Bald Eagle perches in the immediate vicinity of lakeshores form an essential habitat requirement for BAEA in the Big Bear Valley. Big Bear Lake and Baldwin Lake support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program site, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. However, the proposed Solar Evaporation Ponds and Baldwin Lake Pipeline Alignment Option should be constructed when those portions of Baldwin Lake are dry, as BAEA prey (i.e., fish, waterfowl.), BAEA would be expected to be absent from the Program Area."* The provisions of the recommended mitigation measure provided in this comment do not appear to conform to the USFWS National Bald Eagle Management Guidelines (USFWS Guidelines),¹¹ as the requirements provided therein are far less stringent than provisions set forth in CDFW's suggested mitigation measure, particularly in relation to the buffers from bald eagle nests (USFWS suggests an up to 660 foot buffer for construction projects such as that which is proposed by this Program, specific only to nesting birds, not foraging birds).

The USFWS provides recommendations for activities that would impact bald eagle nests. Bald eagle activity in Big Bear Valley is well documented, and there are no known nesting

¹¹ May 2007, USFWS. National Bald Eagle Management Guidelines
https://www.aphis.usda.gov/plant_health/plant_pest_info/emt/downloads/EaglePrctcnGuidance.pdf (accessed 02/23/24)

locations within the Program footprint, only foraging area, for which **MM BIO-9** provides protection. As such, BBARWA maintains that the nesting bird provisions required by **MM BIO-28**, are sufficient to protect this species, as appropriate buffer zones would be established in the unlikely event that bald eagle nests were to occur within the Program APE.

20-22
cont'd

visit; photographs; and substrate upon which nest is placed. If nesting eagles are detected during the focused surveys, the qualified biologist and Big Bear Area Regional Wastewater Agency shall coordinate with CDFW to develop avoidance and minimization measures to be approved by CDFW. If an occupied nest is detected within 2 miles of the Project, Big Bear Area Regional Wastewater Agency shall implement a one mile line-of-sight and one-half mile no line-of-sight buffer to ensure that Project construction activities do not result in injury or disturbance to eagles. Triggers for adaptive management shall include any evidence of Project-related disturbance to nesting eagles, including but not limited to: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. Adaptive management actions include, but are not limited to, cessation of construction activities that are deemed by a qualified biologist to be the source of eagle disturbance. Buffers will be maintained throughout the breeding season or until the young have fledged and are no longer dependent on the nest or parental care for survival.

Artificial Nighttime Lighting

20-23

CDFW is concerned that the DPEIR does not adequately analyze impacts to biological resources from artificial nighttime lighting and the mitigation measure proposed is insufficient to avoid or reduce impacts to a level less than significant. The DPEIR (p. 4-253) states “there is a minor potential for the Program to impact SPOW or flying squirrel as a result of light pollution.” However, no further details are provided, impacts to biological resources resulting from the use of artificial nighttime lighting during construction and operation of the Project are not analyzed, and the mitigation measure proposed is insufficient in timing and scope to reduce impacts. Designs for lighting to be used during operation of the Project should be included in a revised DPEIR, along with details of artificial nighttime lighting to be used during construction. The direct and indirect impacts of artificial nighttime lighting on biological resources including migratory birds that fly at night, bats, and other nocturnal and crepuscular wildlife should be analyzed, and appropriate avoidance and minimization measures to reduce impacts to less than significant should be included in a revised DPEIR.

20-24

Artificial nighttime lighting often results in light pollution, which has the potential to significantly and adversely affect fish and wildlife. Artificial lighting alters ecological processes including, but not limited to, the temporal niches of species; the repair and recovery of physiological function; the measurement of time through interference with the detection of circadian and lunar and seasonal cycles; the detection of resources and natural enemies; and navigation (Gatson et al. 2013). Many species use photoperiod cues for communication (e.g., bird song; Miller 2006), determining when to begin foraging (Stone et al. 2009), behavior thermoregulation (Beiswenger 1977), and migration (Longcore and Rich 2004). Phototaxis, a phenomenon which results in attraction and movement towards light, can disorient, entrap, and temporarily blind wildlife species that experience it (Longcore and Rich 2004).

20-25

CDFW appreciates the inclusion of MM BIO-12; however, the measure is insufficient in scope and timing to reduce impacts to a level less than significant. Because of the potential for artificial nighttime light to negatively impact wildlife, CDFW recommends a revised DPEIR include details of the use of artificial nighttime lighting proposed for construction and operation of the Project and an analysis of impacts to biological resources, as well as specific avoidance and minimization measures to ensure that impacts to wildlife are reduced to less than significant. CDFW recommends BBARWA include the following mitigation measure in a revised DPEIR:

MM BIO-[D]: Artificial Nighttime Light

- 20-23 The comment conveys concern regarding potential impacts to biological resources from artificial nighttime lighting. The comment alleges that **MM BIO-12** is insufficient to protect SPOW, flying squirrel, and other nocturnal species from light pollution, but does not describe from which infirmities this mitigation measure suffers. Without more guidance as to which infirmities this mitigation measure suffers, BBARWA cannot provide further comment on this matter.
- 20-24 The comment points to evidence that artificial nighttime lighting may adversely impact biological resources. The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 20-25 The comment recommends an additional mitigation measure to address the potential for artificial nighttime lighting to negatively impact wildlife. While BBARWA believes that **MM BIO-12**, in addition to **MMs AES-6 and AES-7**, which are aesthetics mitigation measures that would cover the potential for artificial nighttime lighting to negatively impact wildlife, this mitigation measure does not specify what mitigation would specifically minimize or avoid biological resource impacts. Thus, BBARWA proposes to amend Mitigation Measure **AES-7**, to incorporate the provisions of CDFW's Mitigation Measure BIO-[D] proposed in this comment to ensure that there is clear language incorporated into the FPEIR, which is addressed as follows (see underline, strikeout changes, below):

AES-7: *A facility lighting plan that shall apply to construction and operation shall be prepared for each Replenish Big Bear Program component and shall demonstrate that glare from construction, operation and safety night lights that may create light and glare affecting adjacent occupied property are sufficiently shielded to prevent light and glare from spilling into occupied structures. This plan shall specifically verify that the lighting doesn't exceed 1.0 lumen at the nearest residence to any lighting site within the project footprint. This plan shall be implemented by the implementing agency to minimize light or glare intrusion onto adjacent properties.*

During Program construction and operation, the Implementing Agency shall eliminate all nonessential lighting throughout each individual Program area and avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active. BBARWA shall ensure that lighting for Program activities is shielded, cast downward, and does not spill over onto other properties or upward into the night sky, except where essential to perform Program operations (see the International Dark-Sky Association standards at <http://darksky.org/>). BBARWA shall ensure use of LED lighting with a correlated color temperature of 3,000 Kelvins or less.

The above modification constitutes a modification to a mitigation measure that does not require recirculation pursuant to CEQA Section 15073.5(c). BBARWA believes that, with the above changes to **MM AES-7**, potential impacts to wildlife from artificial nighttime lighting at a future Replenish Big Bear Program project sites will be mitigated to the greatest extent feasible. These Responses to Comments demonstrate that the DPEIR has not underestimated potential biological resource impacts.

20-25
cont'd

During Project construction and operation, BBARWA shall eliminate all nonessential lighting throughout the Project area and avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active. BBARWA shall ensure that lighting for Project activities is shielded, cast downward, and does not spill over onto other properties or upward into the night sky (see the International Dark-Sky Association standards at <http://darksky.org/>). BBARWA shall ensure use of LED lighting with a correlated color temperature of 3,000 Kelvins or less, proper disposal of hazardous waste, and recycling of lighting that contains toxic compounds with a qualified recycler.

Revegetation Plan

20-26

The DPEIR states (p. 4-281) that “the disturbed areas shall be revegetated using a plant mix of native species that are suitable for long term vegetation management at the specific site,” but no further details are provided. Results from revegetation activities could consequently lead to negative impacts if the Proponent disregards the plant community alliances by species and relative cover that are proposed to be restored, and if the seed mixes are sourced from non-local seeds with incorrect variety and subspecies or include invasives. Prior to revegetation efforts, CDFW encourages BBARWA to identify the alliances in the proposed revegetation areas and list the species with corresponding relative cover that are found in each alliance in the surrounding area. In this way, BBARWA can use the species cover information as a success criterion to identify in detail which components of the communities they are trying to restore. CDFW strongly encourages the seeds that are used are from local populations free of invasive species because using non-local seeds introduces plants that are not locally adapted to the area.

Restoration projects that use species that are non-local often do not restore natural communities as intended but bring in non-local materials (i.e., genes, pathogens, outbreeding depression, etc.) (Mijnsbrugge et al. 2010) and distribute plants in unnatural groupings. Additionally, the revegetation seed mixes that do not identify the variety or subspecies that will to be used could be detrimental to revegetation efforts. For example, California buckwheat (*Eriogonum fasciculatum*) has four recognized varieties (var. *foliolosum*, var. *polifolium*, var. *fasciculatum*, and var. *flavoviride*) that commonly grow in California in opposing regions. It is important to use the correct variety or subspecies for the location because they are most likely to establish, persist, and reproduce on the sites (Stevens 2004).

Although the DPEIR includes MM BIO-14, the measure is insufficient to reduce impacts that could result from revegetation activities. CDFW recommends BBARWA include the following additional mitigation measure in a revised DPEIR:

MM BIO-[E]: Revegetation Plan

20-27

Within 12 months prior to the initiation of Project activities, and during the appropriate periods (e.g., seasons, weather conditions, times of day) to identify species potentially occurring onsite, the Project Proponent shall conduct general and, if necessary, focused biological surveys to identify alliances that occur on the Project site. The Project proponent shall list the species with corresponding relative cover that are found in each alliance in the surrounding area to provide a baseline for vegetation selection. Once the appropriate species are identified that are deemed appropriate to use in the vegetation restoration, the project proponent shall also identify the correct variety or subspecies appropriate for the borrow site locations. If the Project proponent intends to use a commercial vendor to obtain seed mixes, they should ensure that the vendor is using local seeds in their mix

- 20-26 The comment alleges that the DPEIR does not provide enough detail regarding a revegetation plan for individual project sites after construction of Program facilities. The comment details the importance of revegetation and the manner in which restoration should be carried forth. The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 20-27 The comment alleges that **MM BIO-14** is insufficient to reduce impacts that could result from revegetation activities, but does not describe from which infirmities this mitigation measure suffers. The comment recommends the inclusion of a new mitigation measure to further reduce impacts related to revegetation efforts. BBARWA and the Program Team are committed to revegetating sites with native plant species in Big Bear Valley with the understanding that native species to this area are important to the continued success of native species in the Big Bear Valley. The suggestion in Comment 20-26 that “non-local” species would be considered would be negated by the fact that **MM BIO-14** requires “long term vegetation management...which shall be implemented in cooperation with regulatory agencies and with oversight from a biologist,” which BBARWA believes would ensure successful revegetation efforts. However, BBARWA proposes to amend **MM BIO-14** to include more specific success measures to conform to what BBARWA believes is the intent of CDFW’s proposed mitigation measure (revisions are shown in underline and strikeout):

BIO-14 *Prior to the commencement of construction within or adjacent to any natural area, and during the appropriate periods (e.g., seasons, weather conditions, times of day), a biologist/botanist shall survey the APE to identify native species (alliances, variety, and/or subspecies) within the natural areas that would be appropriate for revegetation. As part of completion of the final site development, after ground disturbance has occurred within or adjacent to any natural area, the disturbed areas shall be revegetated using a plant mix of native plant species that are suitable for long term vegetation management at the specific site as identified by the site biologist/botanist pre-construction survey, which shall be implemented in cooperation with regulatory agencies and with oversight from a biologist. The seeds mix shall be verified to contain ~~minimum amount of~~ no invasive plant species seeds. If seeds mix without potential invasive species does not exist for the native species to the APE, the seeds mix shall contain the absolute minimum amount of invasive species reasonably available for the Program Area.*

The above modification constitutes a modification to a mitigation measure that does not require recirculation pursuant to CEQA Section 15073.5(c). BBARWA believes that, with the above changes to **MM BIO-14**, potential impacts to habitat from revegetation from implementation of the Replenish Big Bear Program will be mitigated to the greatest extent feasible. These Responses to Comments demonstrate that the DPEIR has not underestimated potential biological resource impacts.

20-27
cont'd

with the appropriate variety and subspecies. The seed mixes shall not include invasive species.

CDFW Lake and Streambed Alteration Program

The Biological Resources & Jurisdictional Waters Assessment for the DPEIR indicates that the Project is likely to result in temporary and/or permanent impacts to resources subject to Fish and Game Code section 1602, including but not limited to Stanfield Marsh, Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel.

20-28

Fish and Game Code section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following: substantially divert or obstruct the natural flow of any river, stream, or lake; substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or deposit debris, waste or other materials that could pass into any river, stream or lake. Note that "any river, stream or lake" includes those that are episodic (i.e., those that are dry for periods of time) as well as those that are perennial (i.e., those that flow year-round). This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water. Upon receipt of a complete notification, CDFW determines if the proposed Project activities may substantially adversely affect existing fish and wildlife resources and whether a Lake and Streambed Alteration (LSA) Agreement is required. An LSA Agreement includes measures necessary to protect existing fish and wildlife resources. CDFW may suggest ways to modify the Project that would eliminate or reduce harmful impacts to fish and wildlife resources. CDFW's issuance of an LSA Agreement is a "project" subject to CEQA (see Pub. Resources Code § 21065). Early consultation with CDFW is recommended since modification of the proposed Project may be required to avoid or reduce impacts to fish and wildlife resources. To submit a Lake or Streambed Alteration notification, visit: <https://wildlife.ca.gov/Conservation/Environmental-Review/LSA>.

20-29

Although the DPEIR includes MM BIO-26, CDFW finds that the measure is insufficient to reduce impacts to resources subject to Fish and Game Code section 1602. Because of the potential for impacts to resources subject to Fish and Game Code section 1602, CDFW recommends BBARWA include the following additional mitigation measure in a revised DPEIR:

MM BIO-[F]: CDFW's Lake and Stream Alteration (LSA) Program

Prior to Project-activities and issuance of any grading permit, the Project Sponsor shall obtain written correspondence from the California Department of Fish and Wildlife (CDFW) stating that notification under section 1602 of the Fish and Game Code is not required for the Project, or the Project Sponsor shall obtain a CDFW-executed Lake and Streambed Alteration Agreement, authorizing impacts to Fish and Game Code section 1602 resources associated with the Project.

ENVIRONMENTAL DATA

20-30

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, § 21003, subd. (e).) Accordingly, please report any special status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDDB). The CNDDDB field survey form can be filled out and submitted online at the following link: <https://wildlife.ca.gov/Data/CNDDDB/Submitting-Data>. The types of information reported to CNDDDB can be found at the following link: <https://www.wildlife.ca.gov/Data/CNDDDB/Plants-and-Animals>.

- 20-28 The comment reiterates a point from the DPEIR that the project is likely to result in temporary and/or permanent impacts to resources subject to Fish and Game Code section 1602, including but not limited to Stanfield Marsh, Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel. The comment details the requirements of Fish and Game Code section 1602. Further, the comment recommends early consultation with CDFW to obtain Lake and Streambed Alteration Agreements. BBARWA is in receipt of this recommendation, and will submit the applications for the applicable regulatory permits early, as suggested in this comment.
- 20-29 The comment alleges that **MM BIO-26** is insufficient to reduce impacts to resources subject to Fish and Game Code (FGC) section 1602, but does not describe from which infirmities this mitigation measure suffers. **MM BIO-26** requires that *“any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation.”* It also would require that *“A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.”* Jurisdictional waters shall be determined through the implementation of **MM BIO-27**, which requires jurisdictional surveys for each individual project under the proposed Program. If jurisdictional features are found within a given site, notification requirements pursuant to FGC Section 1602, and any other requirements by the USACE, RWQCB, CDFW, or SWRCB, where applicable, will be carried out, as required by **MM BIO-26**. It is anticipated that the implementation of Program components within Stanfield Marsh, Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel, as noted by CDFW in comment 20-29, would require regulatory permits from CDFW and/or other regulatory agencies (USACE, RWQCB, or SWRCB). As the need for regulatory permitting, including the specific permits anticipated to be necessary for each Program component, were properly identified in the DPEIR, the requested inclusion of CDFW **MM BIO-[F]** is not necessary to ensure compliance with Fish and Game Code section 1602 or other compliance with other regulatory agency laws over jurisdictional features.
- 20-30 BBARWA and/or the Implementing Agency of a given Replenish Big Bear Program facility will report any special status species and natural communities detected during future site-specific surveys to the California Natural Diversity Database (CNDDDB). The link to CNDDDB field survey form provided will be retained in the project file, as will the email address that is provided in this comment. Additionally, the link pertaining to the types of information reported to CNDDDB will be retained in the project file.

ENVIRONMENTAL DOCUMENT FILING FEES

20-31 The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of environmental document filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the environmental document filing fee is required in order for the underlying project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089.)

CONCLUSION

20-32 CDFW appreciates the opportunity to comment on the recirculated DPEIR to assist the BBARWA in identifying and mitigating Project impacts on biological resources. CDFW concludes that the DPEIR does not adequately identify or mitigate the Project's significant, or potentially significant impacts on biological resources. CDFW also concludes that the DPEIR lacks sufficient information for a meaningful review of impacts to biological resources, including a complete and accurate assessment of biological resources in the Project area and subsequent impact analyses. The CEQA Guidelines indicate that recirculation is required when insufficient information in the DPEIR precludes a meaningful review (§ 15088.5) or when a new significant effect is identified (§ 15088.5). CDFW recommends that a revised DPEIR, including a complete assessment of impacts to biological resources and a complete project description, as well as mitigation to avoid and reduce those impacts to less than significant, be recirculated for public comment.

20-33 CDFW personnel are available for consultation regarding biological resources and strategies to minimize impacts. Questions regarding this letter or further coordination should be directed to Alyssa Hockaday, Senior Environmental Scientist (Specialist) at (760) 920-8252 or Alyssa.Hockaday@wildlife.ca.gov.

Sincerely,

References

- 20-31 BBARWA understands the assessment of CDFW filing fees, and understands that the lead agency (BBARWA) will be responsible for the payment of such fees upon filing the Notice of Determination for the proposed project.
- 20-32 BBARWA disagrees with the assessment that recirculation of the DPEIR is necessary due to a lack of sufficient information. While the comment claims the DPEIR lacks “a complete and accurate assessment of biological resources on the Project site,” the DPEIR not only provides site specific biological data where an individual Program component has been defined in sufficient detail to do so, it has also properly truncated project-specific analysis for the Sand Canyon Monitoring Wells, for which specific locations are presently unknown, or, if known (speculatively or otherwise), site-specific investigations have not yet begun because the proposed project is at a conceptual level of planning (i.e. for the Shay Pond Discharge Project). Analysis of site-specific biological resource impacts can only occur once a site is identified or, in the case of the Shay Pond Discharge Project, once this project is defined at concrete (i.e. not speculative) level (CEQA Guidelines §§15144, 15145). Thus, BBARWA does not believe that recirculation of the DPEIR is necessary to ensure compliance with CEQA.
- 20-33 The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program. The contact information provided in this comment will be retained in the project file.

ATTACHMENT 1: MITIGATION MONITORING AND REPORTING PROGRAM (MMRP)

Biological Resources (BIO)		
Mitigation Measure (MM) Description	Implementation Schedule	Responsible Parties
<p>MM BIO-[A]: Compensatory Mitigation for Impacts to Bird-foot Checkerbloom Prior to construction within areas containing bird-foot checkerbloom, Big Bear Area Regional Wastewater Agency shall either fully avoid the plant(s), with an appropriate buffer established by a qualified botanist and marked in the field (i.e., fencing or flagging), or mitigate the loss of the plant(s) through the purchase of mitigation credits from a CDFW-approved bank, or the acquisition and conservation of land approved by CDFW at a minimum 3:1 (replacement-to-impact) ratio.</p>	<p>Prior to commencement of Project activities.</p>	<p>BBARWA</p>
<p>MM BIO-[B]: Pre-Construction Nesting Bird Survey Regardless of the time of year, nesting bird surveys shall be performed by a qualified avian biologist no more than 3 days prior to vegetation removal or ground-disturbing activities. Pre-construction surveys shall focus on both direct and indirect evidence of nesting, including nest locations and nesting behavior. The qualified avian biologist will make every effort to avoid potential nest predation as a result of survey and monitoring efforts. If active nests are found during the pre-construction nesting bird surveys, a qualified biologist shall establish an appropriate nest buffer to be marked on the ground. Nest buffers are species specific and shall be at least 300 feet for passerines and 500 feet for raptors. A smaller or larger buffer may be determined by the qualified biologist familiar with the nesting phenology of the nesting species and based on nest and buffer monitoring results. Construction activities may not occur inside the established buffers, which shall remain on site until a qualified biologist determines the young have fledged or the nest is no longer active. Active nests and adequacy of the established buffer distance shall be monitored daily by the qualified biologist until the qualified biologist has determined the young have fledged or the Project has been completed. The qualified biologist has the authority to stop work if nesting pairs exhibit signs of disturbance.</p>	<p>No more than three (3) days prior to vegetation clearing or ground-disturbing activities.</p>	<p>BBARWA</p>
<p>MM BIO-[C]: Bald Eagle Pre-Construction Surveys Prior to adoption of the CEQA document and prior to Project activities, a qualified biologist shall conduct focused breeding surveys for bald eagle, following appropriate protocols: CDFW's Bald Eagle Nesting Territory Survey Form and Instructions (2010) and USFWS Protocol for Evaluating Bald Eagle Habitat and Populations in California (2004) or more current guidance from USFWS. If helicopters are used, only one helicopter survey will occur, and additional surveys will be conducted via ground observations. The helicopter must stay 200 meters away from any potential nest sites (i.e., cliffs, treetops, platforms, etc.). If an active nest is discovered,</p>	<p>Prior to adoption of the CEQA document and prior to Project activities.</p>	<p>BBARWA</p>

<p>do not stop for more than 5-10 seconds to determine status. If follow-up helicopter surveys are required to get closer to any potential or confirmed nests, Big Bear Area Regional Wastewater Agency should contact CDFW about potentially issuing a Memorandum of Understanding (MOU). Data collected during the nesting season surveys shall include the following: territory status (unknown, vacant, occupied, breeding successful, breeding unsuccessful); nest location, nest elevation; age class of eagles observed; nesting chronology; number of young at each visit; photographs; and substrate upon which nest is placed. If nesting eagles are detected during the focused surveys, the qualified biologist and Big Bear Area Regional Wastewater Agency shall coordinate with CDFW to develop avoidance and minimization measures to be approved by CDFW. If an occupied nest is detected within 2 miles of the Project, Big Bear Area Regional Wastewater Agency shall implement a one mile line-of-sight and one-half mile no line-of-sight buffer to ensure that Project construction activities do not result in injury or disturbance to eagles. Triggers for adaptive management shall include any evidence of Project-related disturbance to nesting eagles, including but not limited to: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. Adaptive management actions include, but are not limited to, cessation of construction activities that are deemed by a qualified biologist to be the source of eagle disturbance. Buffers will be maintained throughout the breeding season or until the young have fledged and are no longer dependent on the nest or parental care for survival.</p>		
<p>MM BIO-[D]: Artificial Nighttime Light During Project construction and operation, BBARWA shall eliminate all nonessential lighting throughout the Project area and avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active. BBARWA shall ensure that lighting for Project activities is shielded, cast downward, and does not spill over onto other properties or upward into the night sky (see the International Dark-Sky Association standards at http://darksky.org/). BBARWA shall ensure use of LED lighting with a correlated color temperature of 3,000 Kelvins or less, proper disposal of hazardous waste, and recycling of lighting that contains toxic compounds with a qualified recycler.</p>	<p>During Project construction activities and operation.</p>	<p>BBARWA</p>
<p>MM BIO-[E]: Revegetation Plan Within 12 months prior to the initiation of Project activities, and during the appropriate periods (e.g., seasons, weather conditions, times of day) to identify species potentially occurring onsite, the Project Proponent shall conduct general and, if necessary, focused biological surveys to identify alliances that occur on the Project site. The Project proponent shall list the species with corresponding relative cover that are found in each alliance in the surrounding area to provide a baseline for vegetation selection. Once the appropriate species are identified that are deemed appropriate to use in the vegetation restoration, the project proponent shall also identify the correct variety or subspecies appropriate for the borrow site locations. If the Project proponent intends to use a commercial vendor to obtain seed mixes, they should ensure that the vendor is</p>	<p>Within 12 months prior to the initiation of Project activities.</p>	<p>BBARWA</p>

<p>using local seeds in their mix with the appropriate variety and subspecies. The seed mixes shall not include invasive species.</p>		
<p>MM BIO-[F]: CDFW's Lake and Streambed Alteration (LSA) Program Prior to Project-activities and issuance of any grading permit, the Project Sponsor shall obtain written correspondence from the California Department of Fish and Wildlife (CDFW) stating that notification under section 1602 of the Fish and Game Code is not required for the Project, or the Project Sponsor shall obtain a CDFW-executed Lake and Streambed Alteration Agreement, authorizing impacts to Fish and Game Code section 1602 resources associated with the Project.</p>	<p>Prior to Project-activities and issuance of any grading permit.</p>	<p>BBARWA</p>

Big Bear City, CA 92314

Re: Comments on the Draft Program Environmental Impact Report for the Replenish Big Bear Project, SCH 2022110595

Dear Ms. Burton:

21-1 The Mojave Water Agency (MWA; Agency) appreciates the opportunity to provide comments on the Draft Program Environmental Impact Report for the Replenish Big Bear Project (DPEIR). As stated in our previous letter dated January 16, 2023, the MWA acts as the court appointed Watermaster for the Mojave Basin Area. The Watermaster is responsible for enforcing terms of the Judgment in the matter of *City of Barstow, et al. v. City of Adelanto, et al., Riverside County Superior Court, Case No. 208568*. The Judgment dated January 10, 1996, adjudicated the water rights of all parties within the Mojave Basin Area boundary (about 3,400 square miles). The adjudication was initiated as a result of continuous overdraft in the Mojave Basin over many years. The purpose of the Judgment was to balance supply and demand within all areas. The proposed Replenish Big Bear Project will affect water supply accruing to a portion of the Mojave Basin within the Este Subarea (Lucerne Valley area) identified in the Judgment.

21-2 The population in the Este Subarea is approximately 8,000 people who share the same limited water supply. The entire area is categorized as an economically disadvantaged community. Water use in the Este Subarea consists mostly of agriculture, industrial, municipal (including small mutual water systems) and a high concentration of small domestic users on private water wells. Total water production in the area averages 5,100 acre-feet per year. The long-term average annual water supply is estimated to be about 5,100 acre-feet of which the largest portion includes the waste discharge to the area from the Big Bear Area Wastewater Reclamation Area (BBARWA). Natural water recharge is limited to mountain front recharge and recharge from ephemeral washes.

21-3 The Replenish Big Bear project will reduce the amount of water discharged to the Este Subarea which has been an inherently permanent condition dedicated for public use and a constant source of supply for over 40 years. Loss of the supply also affects the water balance calculation used to establish Free Production Allowances of the parties under the Mojave Judgment. A loss of supply would require cutbacks (rampdowns) greater than those that have already been imposed by the court under the Judgment. Currently, the Este Subarea's rampdown is set at 55% of Base Annual Production. Additional Rampdown for the Este Subarea may require as much as 35% percentage points of reduction if the BBARWA waste discharge is permanently

**RESPONSE TO COMMENT
LETTER #21
MOJAVE WATER AGENCY**

21-1 The comment outlines MWA's role as the court appointed Watermaster of the Mojave Basin Area (MBA) as stipulated in the Judgement referenced in this comment. The comment summarizes the purpose of the Judgement, the adjudication of the MBA, and notes that the Replenish Big Bear Program will impact the water supply accruing to a portion of the MBA within the Este Subarea (Lucerne Valley Basin). The impacts on the Lucerne Valley Basin are documented throughout the DPEIR, including significant impacts related to the following:

- Reduced discharge to LV Site, as a result of the Program, has the potential to contribute to water quality degradation in the Lucerne Valley Basin by removing a dilution source;
- The Program has a potential to reduce the groundwater recharge of the Lucerne Valley Basin due to the reduction in discharge to the LV Site; and,
- The reduction in discharge to the LV Site has the potential to impact the amount of water expected to be recharged to the Lucerne Valley Basin on an annual basis, thereby impacting water supplies for users of the Lucerne Valley Basin.

The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

21-2 The comment provides a detailed account of the Este Subarea population, setting, the total production, and the long-term average water supply. The comment notes that the largest portion of the accounting of the long-term water supply is the secondary effluent discharge by BBARWA to its LV Site. Under Subchapter 4.11, Hydrology and Water Quality, of the DPEIR, it is acknowledged that the BBARWA discharge of secondary effluent to the LV Site is a large contributor to recharge in the Lucerne Valley Basin. MBA Watermaster, in its Consumptive Water Use Study and Production Safe Yield Update for 2017-2018, dated May 1, 2019, assumes that BBARWA's discharge of secondary effluent to the LV Site contributes 2,000 AFY to the Este Subarea. However, WSC prepared a Water Balance utilizing data from BBARWA's actual discharge operations to the LV Site, and determined that the amount of water recharged to the Lucerne Valley Basin is 1,610 AFY. Utilizing the long-term average quoted in this comment (5,100 AF), BBARWA's discharge of secondary effluent to the LV Site accounts for 31% of the long-term average recharge to the Lucerne Valley Basin (Este Subarea).

21-3 BBARWA is not a party to the Mojave groundwater adjudication and not bound by its terms. Neither MWA nor the court have the authority to compel BBARWA to continue to discharge water in the Mojave Basin. The judgment has been in place for over a quarter of a century and during that time MWA and the parties to the judgment have taken many meaningful management actions to strengthen the Basin's water supply. MWA has the management authority to address any issues with the water supply in Este.

21-3
cont'd moved. This loss should be mitigated to the benefit of the 8,000 economically disadvantaged residents that have relied on it for that past 40 years. MWA and Watermaster Boards have received public comments from area residents recently who are worried about the potential loss of supply and the effect of additional rampdowns the area would face if the loss of supply is not mitigated.

21-4 The DPEIR does not provide sufficient mitigation to alleviate the impact. The DPEIR (Section 4.20.7, Page 4-952) specifically states that:

“No mitigation is available to reduce the potential for a significant and unavoidable impact to occur on water supplies in the Lucerne Valley Basin as a result of Program implementation. This is because the Program would reduce the amount of water that would be discharged to the Lucerne Valley Basin, which has the potential to impact the amount of water that could be expected to be recharged in the Lucerne Valley Basin on an annual basis, thereby impacting water supplies. Therefore, the proposed Program would have a significant and unavoidable potential for the implementation of the project to substantially impair the availability of water supplies in the Lucerne Valley Basin as a result of the reduction in recharge to the Lucerne Valley Basin.”

21-5 MWA staff met with project staff and reviewed materials presented which identify that the loss to the Este Subarea will be about 1,610 acre-feet per year. The MWA as acting Watermaster implements the Judgment at the direction of the Court and is obligated to manage the subareas for sustainability. If the impact is not mitigated, the Este Subarea area will be adversely affected and would further be thrown out of balance. The MWA believes the conclusion in the DPEIR that the identified significant and unavoidable impact to water supplies cannot be mitigated is incomplete. The impact could be avoided in the same manner replacement obligations under the Judgment are currently effectuated—via the import of water to offset the loss of water supply to the Este Subarea.

21-6 We welcome further discussion to find solutions for mitigating this impact and would be open to partnering with the project proponents to find better ways to recharge water within the Este Subarea.

If you have any questions, please feel free to contact me at 760-946-7000.

Sincerely,

Adnan Anabtawi
General Manager

Attachment: MWA letter on NOP dated 1/16/2023

Robert C. Wagner, Watermaster Engineer
Valerie Wiegenstein, Director of Basin Management and Resource Planning

- 21-4 The comment alleges that the DPEIR does not provide sufficient mitigation to alleviate the impact. Please refer to response 21-3 above.
- 21-5 The comment refers to an impact to water supplies. Please refer to response 21-3 above.
- 21-6 The comment indicates that MWA would welcome finding solutions for mitigating the impacts from the reduction in discharge to the LV Site, and that MWA would be open to partnering with the Program Team to find better ways to recharge water within the Este Subarea. BBARWA echoes that the Program Team welcomes a partnership to find the best use of the flows BBARWA will send to the LV Site that would result once the Program has been implemented. Please refer to Response to Comment 21-9 below.

Re: Replenish Big Bear Program--Notice of Preparation of draft EIR, SCH 2022110595

Dear Ms. Burton:

The Replenish Big Bear Program (Program) is intended to capture and reuse up to 2,250 acre-feet/year to maintain water levels in Big Bear Lake and other reuse projects. This project will significantly reduce the waste flow to BBARWA's current Lucerne Valley disposal area.

Lucerne Valley is part of the Mojave Basin Area within the Mojave Water Agency and subject to the continuing jurisdiction of the Riverside County Superior Court pursuant to the adjudication of water resources in the case *City of Barstow, et al. v. City of Adelanto et al.* Pumping and use of water supplies are subject to the Riverside Superior Court. The Lucerne Valley area has received the waste since about 1980. The waste is a significant part of the total water supply for this area and any reduction will impact an already severely over drafted groundwater basin.

The Program's project EIR should evaluate any impacts associated with the reduction in flow to Lucerne Valley as well as identify and evaluate water quality impacts from the waste to the Lucerne Valley area for the past 42 years.

Further, we note that there is a desert wash about one mile north to the Lucerne Valley site that carries surface waters when rainfall is abundant. The recharge from the Lucerne Valley site may contribute in the subsurface to waters supporting flow in the wash and potentially desert habitats. Consequently, a Wastewater Change Petition approval may be required from the SWRCB for this Program.

The Mojave Water Agency looks forward to resolving issues regarding the Replenish Program that affect the Mojave Basin Area.

Please continue to maintain MWA on your list for notification on the upcoming draft EIR. If you have any questions, please feel free to contact me or Valerie Wiegenstein at 760-946-7000.

Sincerely,

A handwritten signature in blue ink that reads "Allison Febbo".

Comment Letter #22

Big Bear Eyes New Home for Wastewater

Feb 13, 2024

Dear Editor,

22-1 | Here in the Big Bear Valley, the water that falls from the heavens and percolates through hundreds of feet of rock and soil to rest for our use in the aquifer beneath us is our only water source. This will always be our only water source.

22-2 | The chances of BBARWA operating this new “Program Water” — wastewater filtering and injection-reuse facility — year after year with no catastrophic failures is absolutely zero. The proposed use of the latest technology is simply not without significant danger to the end user of “Program Water” and the general environment.

22-3 | The lack of vigorous opposition to recharging groundwater aquifers with filtered wastewater does not mean there is not significant risk in doing so.

22-4 | The chance people in the valley would ever hear a peep from BBARWA or CSD about a failure in any system under its control — major or minor — is simply nonexistent.

22-5 | The lack of critical thinking when it comes to matters of grave importance today is just staggering. For example, the multitude of mistakes made — with little or no opposition being voiced or just censored — promoting popular trends in the past several years such as electric vehicles, education, election integrity, and MRNA vaccines, has had some devastating outcomes. Yet onward we march into the corporate funded darkness.

22-6 | And the costs. The costs for “The Program” are not stated in the BBARWA presentation beyond the 75 million dollars initially. No mention of the increased operations, personnel, repairs,

**RESPONSE TO COMMENT
LETTER #22
TOM SITTON**

- 22-1 The comment notes that the source of water in Big Bear Valley is precipitation. The sole supply source in the Big Bear Valley is presently local groundwater.
- 22-2 The comment conveys the commenter's opinion that the Replenish Big Bear Program cannot operate without catastrophic failure. Advanced Water Purification technologies such as that which is proposed by this Program are utilized throughout the state, as discussed in Responses to Comment 13-4, which outlines where these types of projects have been implemented. These technologies would operate similarly to that which occurs as part of BBARWA's existing operations, and the safety of these systems would be comparable to the existing operations.
- 22-3 The commenter alleges that there is significant risk in recharging the groundwater aquifer with "filtered wastewater." Recharge of wastewater, through a variety of means—by well injection, through the use of existing waterways, through recharge basins, etc.—is occurring throughout the State, with vigorous study and oversight by the State Water Resources Control Board Division of Drinking Water (DDW) to ensure that the use of recycled water is protective of public health. This comment does not cite any specific risks of concern in this comment, and therefore, BBARWA cannot provide further comment on the opinion cited by the commenter.
- 22-4 The commenter alleges that BBARWA and BBCCSD would not notify the public of a failure of any system under its control. There are a number of notification mechanisms by which BBARWA must adhere. BBARWA is required to report any sewer spills per its permits from the RWQCBs. It is entered into the California Integrated Water Quality System (CIWQS) database and members of the public can view reports thereof at: https://www.waterboards.ca.gov/water_issues/programs/ciwqs/publicreports.html.

BBARWA also has to notify:

- California Office of Emergency Services (Cal OES)
- California Emergency Management Agency Warning Center
- Regional Water Quality Control Board
- California State Health Services of San Bernardino
- San Bernardino County Department of Environmental Health Services

Depending on the location, BBARWA may also have to notify:

- Big Bear Municipal Water District
- US Forest Service

If one of BBARWA's generators has a failure that results in emissions in excess of its permit emission limits, BBARWA has to report to SCAQMD. These records can be accessed through a public records request to SCAQMD.

If BBARWA has an emergency that affects its excavation permits then it is required to notify the agency that issued the permit to advise the agency of the emergency repair and

follow a specific set of instructions (CalTrans, San Bernardino County). These records can be accessed through a public records request to the permitting agency.

BBARWA's San Bernardino County Certified Unified Program Agencies (CUPA) permits require notification if there is an accidental release of hazardous materials. These records can be accessed through a public records request to the CUPA. Based on the above, there are a number of agencies in which records of a failure of any system under BBARWA's control can be accessed by the public.

- 22-5 The contents of this comment express the opinions of the commenter and the contents do not pertain to the DPEIR and Replenish Big Bear Program as a whole, and as such, do not warrant further response.
- 22-6 The comment asks how the Program would be funded. Please refer to Response to Comment 19-15, which responds to the concerns conveyed in this comment completely.

22-6
cont'd | maintenance, replacement, interest, and debt service on the borrowing, all to be paid by rate payers, who have not been asked if they would want this or even agree to pay for it.

22-7 | Science is currently using tactics of brow beating, ridiculing, and shaming local government and the public into submission and acceptance of whatever popular and lucrative science corporate America is currently funding. This corporate funding of science outcomes for its own fleecing of taxpayers has even dulled the senses of once powerful voices of large environmental groups who now seem happy to campaign for extreme leftist or radical Marxist causes.

22-8 | I warn all Big Bear Valley citizens today, do not count on anybody from our lemming-like political class to protect you and not permanently ruin your only water source in the name of their own resumes.

22-9 | As we have come to expect, this boondoggle has been flying well below the radar for years now. The ruling class and the bureaucrats just grind us down —drip, drip, drip, so that they get so far down the road with these types of very expensive projects that they can claim that it just can't be stopped — we have too much invested or, it's for our future, but growth.

22-10 | One area of concern is the use of Reverse Osmosis (RO) Filters for compliance with clean water regulations currently in place. Recharging our aquifer with "Program Water" cleaned in part with this limited technology would prove disastrous if clean water regulations ever identified a new or compound contaminate immune to RO technology.

"Today, the total market share of RO membrane elements for various purposes is about 2 billion USD. According to marketers,

- 22-7 The contents of this comment express the opinions of the commenter and the contents do not pertain to the DPEIR and Replenish Big Bear Program as a whole, and as such, do not warrant further response.
- 22-8 The contents of this comment express the opinions of the commenter alleging that the Program would ruin the water supply in the Big Bear Valley. The rigorous analysis presented in the DPEIR of the potential water quality impacts related to implementation of the Program determined that the impacts related to water quality in the Big Bear Valley, and to downstream users of Big Bear Lake water, would be less than significant. Thus, BBARWA disagrees, and the DPEIR demonstrates that the Program would have no potential to ruin the water supply in the Big Bear Valley.
- 22-9 The contents of this comment express the opinions of the commenter and the contents do not pertain to the DPEIR and Replenish Big Bear Program as a whole, and as such, do not warrant further response.
- 22-10 The comment questions the use of RO as part of the AWPf process. Please refer to Responses to Comments 13-3 and 19-12, which respond to the assertions made in this comment completely.

22-10
cont'd

further rates of use of this technology will grow by 5% per year, and at the same time the market of RO membrane elements designed for seawater desalination, sewage treatment, and for the treatment of tap water will grow proportionally. And this, in turn, means that there will be a proportional increase in the number of spent RO membrane elements, which becomes a significant environmental problem (GarcíaPacheco et al., 2015; Contreras-Martínez et al., 2021; Lawler et al., 2012; Asadollahi et al., 2017).” [ii](#)

22-11

One does not need to be a scientist to recognize obvious risky behavior and practices that might just negatively affect yourself and your family. Also obvious is the monetary incentives for manufacturers and investors of this technology to see its widespread use and market growth.

Sand Canyon Recharge Program

22-12

“Up to 380 AFY of Program Water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period. The cost of this Program is not included in the \$75 million Program cost estimate. This is a BBCCSD and BBLDWP Program that will be completed after a permit is issued.” [iii](#)

RE: Draft Program Environmental Impact Report
Replenish Big Bear Program
State Clearinghouse # 2022110595

23-1 Replenish Big Bear program includes release of the program product water into Big Bear Lake. This activity is a concern to Bear Valley Mutual Water Company. The Replenish Big Bear program product water becomes comingled with the natural runoff that enters Big Bear Lake.

Bear Valley Mutual Water Company ("Bear Valley" or "Mutual") constructed the dam that created Big Bear Lake. The purpose of the Big Bear Lake was to provide supplemental water for use in the San Bernardino Valley area, East Highland, Highland, Mentone and Redlands areas. The water that is released from Big Bear Lake is diverted for use to irrigate citrus, avocados, truck crops, and is treated for use as drinking water. These downstream uses of water from Big Bear Lake require that the water quality of the water released from Big Bear Lake be pristine.

23-2 Under the 1977 Judgment for Big Bear Municipal Water District v. North Fork Water Company et al. San Bernardino County Superior Court Case Number 165493, Bear Valley Mutual Water Company was granted the right to receive 65,000 acre feet of water during any 10 year period from Big Bear Lake. Big Bear Municipal Water District releases water from Big Bear Lake to satisfy State Water Resources Control Board Order 95-4 to protect the fish and environment in Bear Creek. This environmental release of water from Big Bear Lake into Bear Creek is continuous, occurring at all times. This environmental release also satisfies a portion of the Big

**RESPONSE TO COMMENT
LETTER #23
BEAR VALLEY MUTUAL WATER COMPANY**

- 23-1 The comment is noted and will be made available to BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.
- 23-2 The comment refers to Bear Valley's construction of Big Bear Lake's dam, the purpose of Big Bear Lake, and Big Bear Lake's downstream uses of water. The comment also refers to the 1977 Judgment for Big Bear Municipal Water District v. North Fork Water company et al., San Bernardino County Superior Court Case Number 165493. The comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

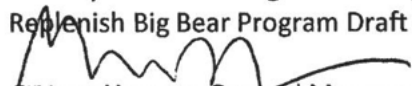

23-2 | Bear Municipal Water District's obligation to provide 65,000 acre feet of water in any 10 year
cont'd | period from Big Bear Lake to Bear Valley Mutual Water Company.

23-3 | Bear Valley Mutual Water Company diverts the water released into Bear Creek from Big Bear
Lake at the Bear Creek confluence with the Santa Ana River. Bear Valley Mutual Water
Company delivers water received from Big Bear Lake to its shareholders which in turn use the
water for agricultural irrigation of crops for human consumption, and treatment at municipal
drinking water treatment plants.

23-4 | Bear Valley Mutual Water Company notices that the use of water in Big Bear Lake for irrigation
of human consumption crops and treatment for drinking water are recognized in Section
4:11.2.2 as the water quality beneficial use designations AGR and MUN assigned by the Santa
Ana Regional Water Quality Control Board and shown in Table 4-11.1. These uses of the
waters of Big Bear Lake must be preserved and protected.

23-5 | Bear Valley Mutual Water Company requests to be included in any discussions and decisions
that may in any way impact the water quantity or the water quality of the water in Big Bear
Lake that Bear Valley Mutual Water Company receives from Big Bear Lake.

Thank you for allowing Bear Valley Mutual Water Company this opportunity to comment on the
Replenish Big Bear Program Draft Program Environmental Impact Report.

George Hanson, General Manager
Bear Valley Mutual Water Company

Re: Replenish Big Bear Program
Draft Program Environmental Impact Report dated December 2023
State Clearinghouse No. 2022110595

Dear Ms. Burton:

This office serves as General Counsel to the Bear Valley Mutual Water Company ("BVMWC").

23-6

Pursuant to the Public Notice of Availability issued in connection with the above-referenced matter and the authority provided in Sections 21082.1(b), 21092.4(a), 21104(a), and 21153 of the Public Resources Code ("PRC") and Sections 15044, 15086, 15201, 15203, and 15209 of Title 14 of the California Code of Regulations ("CCR"), BVMWC submits the following comments to the Big Bear Area Regional Wastewater Agency ("BBARWA") as lead agency under the California Environmental Quality Act ("CEQA"), PRC Section 21000 et seq., and the Guidelines adopted thereunder, CCR Section 15000 et seq., with respect to the Draft Program Environmental Impact Report ("DPEIR") for BBARWA's proposed Replenish Big Bear Program ("Project").

These comments supplement those submitted by BVMWC in its letter to BBARWA dated February 20, 2024, which is attached hereto and incorporated herein by this reference ("BVMWC Comments").

1. **Inadequate Inter-Agency Consultation**

23-7

CEQA requires that the preparation and review of an environmental impact report ("EIR") "should be coordinated in a timely fashion with the existing planning, review, and project approval process being used by each public agency." CCR Section 15004(c). To help facilitate inter-agency coordination, PRC Section 21080.3(a) requires that the lead agency

- 23-6 The comment states that the law office of Brunick, McElhaney & Kennedy serves as General Counsel to Bear Valley pursuant to the Program's Notice of Availability, submit comments on behalf of Bear Valley. The comment is noted. The comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.
- 23-7 The comment states that CEQA requires inter-agency coordination by consulting with all responsible agencies and trustee agencies before preparation of an EIR. The comment claims that BBARWA has not adequately attempted to coordinate input from all interested parties, such as Bear Valley, and therefore failed to fulfill its disclosure obligations under CEQA and provide agencies with an opportunity to ensure the adequacy of the resulting DPEIR.

CEQA is structured to give agencies, such as Bear Valley, the opportunity to become involved in projects if they wish, but does not mandate that they do so. Indeed, consultation with affected responsible and trustee agencies regarding the scope and content of the EIR is often accomplished through distribution of a Notice of Preparation ("NOP"), which the State Clearinghouse transmits to appropriate agencies. (PRC, §§ 21080.4, subd. (a), 21104, 21153; CEQA Guidelines, §§ 15082, 15375.) Here, on November 28, 2022, BBARWA sent its NOP to Bear Valley, which kick-started a forty-five day comment period. On January 5 & 10, 2023, BBARWA held two noticed public meetings to discuss the project. Further, on March 16, 2023, BBARWA held the "Replenish Big Bear Program Santa Ana River Stakeholder Meeting #1," whereby Bear Valley was in attendance, to discuss the Program overview, regulatory pathway, treatment and water quality, the NOP and comments received. BBARWA considered Bear Valley's comments at this meeting and addressed Bear Valley's NOP comment letter in Section 8.2 of the DPEIR. Once a DPEIR is prepared, a lead agency must again consult with responsible and trustee agencies by sending notice to the State Clearinghouse regarding availability of the DPEIR. (CEQA Guidelines, § 15205, subd. (b).) Here, on December 21, 2023, BBARWA sent its Notice of Availability of the DPEIR to the State Clearinghouse, the public, and Bear Valley. The review period was extended 15 days to February 20, 2024. Thus, BBARWA went beyond CEQA's requirements for inter-agency consultation to ensure Bear Valley's participation.

The comment also states that it is not possible to conclude whether the DPEIR incorporates the issues and concerns of the responsible and trustee agencies or provide agencies with sufficient information to carry out later discretionary actions under their authority which are associated with the proposed project.

Issues and concerns that were expressed by comment letters to the Notice of Preparation by any and all responsible and trustee agencies are addressed in Section 8 of the DPEIR. Further, any issues and concerns expressed during the many stakeholder meetings and public hearings were considered by BBARWA and, when necessary, incorporated into the DPEIR. It is not clear what specific issues and concerns Bear Valley is referencing that have not been addressed by BBARWA.

It is unclear what information within the DPEIR Bear Valley is referencing as insufficient so other agencies may later carry out discretionary actions approved by the Program. BBARWA prepared a Program EIR that is designed to allow approval activities within the

Program without the need for further CEQA review. The Program EIR provides descriptions of the activities that would implement the Program along with a specific and comprehensive evaluation of the Program's foreseeable environmental impacts, so that later activities can be approved on the basis of the Program EIR. (State CEQA Guidelines §15168(c)(1)–(2), (5).)

23-7
cont'd

consult with all responsible agencies and trustee agencies before preparation of an EIR. However, BBARWA has not adequately attempted to coordinate environmental input from all interested entities such as BVMWC. By failing to actively involve all parties in the determination of the proper scope and substance of the DPEIR, BBARWA has failed to both fulfill its disclosure obligations under CEQA and to provide those agencies with an opportunity to ensure the adequacy of the resulting DPEIR. Further, it is not possible to conclude whether the DPEIR incorporates the issues and concerns of those agencies or provides those agencies with sufficient information to carry out later discretionary actions under their authority which are associated with the proposed Project.

2. **Notice of Preparation**

23-8

The procedural device used to initiate interagency dialogue is the Notice of Preparation (“NOP”). PRC Sections 21080.4, 21092.2, 21092.3; CCR Section 15082(a). The NOP must be written so as to provide the agencies with sufficient information to enable them to make meaningful responses. The lead agency must consider any information or comments it receives during the period in which a draft EIR is being prepared. PRC Section 21082.1. The DPEIR does not adequately and accurately respond to the comments previously received on the NOP. BBARWA has, therefore, failed to comply with the requirements of PRC Section 21082.1 as well as the guidelines set forth in CCR Section 15151 obligating BBARWA to demonstrate “a good faith effort at full disclosure.”

3. **Content and Preparation of the DPEIR**

23-9

* In order for the DPEIR to effectively serve as the CEQA clearance document for the Project, the DPEIR must be very detailed; in other words, it must include enough Project-specific information to allow an agency to plausibly conclude that, in analyzing “the big picture,” the document also addressed enough details to allow an agency to make informed site specific decisions within the program. Stanislaus Natural Heritage Project v. County of Stanislaus (1996) 48 Cal. App. 4th 182, 55 Cal. Rptr. 2d 625. Thus, the DPEIR must be at once both comprehensive and specific. It must concentrate on the Project’s long-term “cumulative” impacts, but must also contain enough details to anticipate “many subsequent activities within the scope of the project.” CCR Section 15168. However, the DPEIR is not sufficiently clear for the reasons set forth in the BVMWC Comments.

23-10

* A draft EIR must be prepared directly by or under contract to the lead agency. PRC Section 21082.1(a); CCR Section 15084(a). Here, the DPEIR for the Project has been prepared by Tom Dodson & Associates on behalf of BBARWA. However, before using the DPEIR prepared by someone else, BBARWA must subject the document to its own review and analysis so that the DPEIR reflects its own independent judgment. PRC Section 21082.1(c); CCR 15084(e). Thus, BBARWA must itself conduct a reasonable

- 23-8 The comment asserts that the DPEIR does not adequately and accurately respond to the comments previously received on the NOP and BBARWA has therefore failed to comply with CEQA's NOP requirements.

PRC Section 21082.1 states that the lead agency must consider comments submitted, but may include these considerations in the DPPEIR. BBARWA properly considered BVMWC's NOP comment letter and responded in Section 8.2 of the DPEIR. Bear Valley provides no examples or guidance as to how exactly BBARWA did not "adequately and accurately" respond to its NOP comments.

- 23-9 The comment asserts that this a project-level EIR. This DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components. (State CEQA Guidelines §15168(c)(1)–(2), (5).) However, project-level detail is provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and, the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdle that would be necessary to modify the water source supporting the Stickleback. Impacts will be quantitatively addressed in project-specific second tier environmental evaluations once specific aspects of the Program are proposed for implementation and designed. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level. Bear Valley provides no examples or guidance as to how the DPEIR is not sufficiently clear as set forth within its comments.

- 23-10 The comment incorrectly asserts that Tom Dodson & Associates may not prepare the DPEIR for the Program on BBARWA's behalf. In practice, lead agencies commonly either retain a consultant to prepare the EIR or accept an EIR prepared by the applicant or its consultant rather than have their own staff prepare the EIR. CEQA authorizes an agency to enter into a contract for preparation of an EIR (PRC §21082.1(a)), and the CEQA Guidelines permit agencies to accept EIRs prepared by project applicants or their consultants (State CEQA Guidelines §15084(d)(3).) Here, BBARWA contracted environmental consultant, Tom Dodson & Associates, to prepare the EIR on its behalf. BBARWA has extensively reviewed and analyzed the DPEIR prepared by Tom Dodson & Associates, as reflected in its many Board meetings, presentations, drafting, and reviews of the DPEIR. Further, when certifying that the FPEIR is complete, the lead agency must make a specific finding that the document reflects its independent judgment. (PRC §21082.1(c)(3).) BBARWA has drafted this and will present these Findings should BBARWA adopt the FPEIR.

23-10
cont'd

amount of original research to determine the Project's environmental effects. Citizens to Preserve the Ojai v. County of Ventura (1985) 176 Cal. App. 3d 421, 432, 222 Cal. Rptr. 247; Save Our Ecosystems v. Clark (1984) 747 F.2d 1240, 1249. BBARWA's Board of Directors must not delegate any decisionmaking functions under CEQA. Kleist v. City of Glendale (1976) 56 Cal. App. 3d 770, 779, 128 Cal. Rptr. 781; Sundstrom v. County of Mendocino (1988) 202 Cal. App. 3d 296, 307, 248 Cal. Rptr. 352; People v. County of Kern (1976) 62 Cal. App. 3d 761, 133 Cal. Rptr. 389.

23-11

* Each public agency shall adopt objectives, criteria, and specific procedures consistent with CEQA for administering its responsibilities under CEQA. CCR Section 15022(a). However, it appears that no specific reference to BBARWA's own CEQA guidelines is included in the DPEIR. In the absence of this reference, it is unclear whether BBARWA has, in fact, developed and adopted an agency-specific set of CEQA guidelines for the administrations of its actions thereunder. As such, BVMWC formally requests a copy of any such guidelines adopted by BBARWA and a copy of the formal actions of BBARWA's Board of Directors adopting those guidelines, or, conversely, a disclosure by BBARWA (as part of this environmental review record) that it has failed to act in accordance with the above provisions.

23-12

* CCR Section 15378 defines a "project" to mean "the whole of an action which has a potential for resulting in physical change in the environment." Additionally, CCR Section 15355(b) provides that "the cumulative impact from several projects is the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future project." Thus, proposals or parts of proposals which are related to each other closely enough to be, in effect, a single course of action shall be evaluated in a single impact statement. Based upon these CEQA principles, and for the reasons set forth in the BVMWC Comments, BVMWC believes that BBARWA has "fragmented" the Project thereby preventing a complete assessment of all of the Project's potential impacts. By examining only portions of the entire Project (rather than the Project as a whole), the resulting environmental documentation will neither fully nor accurately examine the potential direct, indirect, and cumulative effects associated with the proposed Project, nor will the resulting document explore the potential range of alternatives and mitigation measures which could be derived from a more thorough examination of all Project-related (and Project-relevant) activities. This "truncated project concept" results in the "fallacy of division" which caused the DPEIR to overlook the Project's cumulative impacts by separately focusing on the isolated parts of the whole.

23-13

* CCR Section 15151 states that "an EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." For the

23-11 The comment questions whether BBARWA has developed and adopted an agency-specific set of CEQA guidelines for the administrations of its actions thereunder. BBARWA adopted their CEQA Guidelines on April 26, 2023, a copy of which is available on their website under their CEQA page. (<https://www.bbarwa.org/ceqa-documents>.)

23-12 The comment asserts that BBARWA has “fragmented” the Project thereby preventing a complete assessment of all of the Program’s potential impacts.

This DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components. (State CEQA Guidelines §15168(c)(1)–(2), (5).) However, project-level detail is provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and, the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdle that would be necessary to modify the water source supporting the Stickleback. Impacts will be quantitatively addressed in project-specific second tier environmental evaluations once specific aspects of the Program are proposed for implementation and designed. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level. Based on the above, BBARWA has not “fragmented” the Project. It is merely providing a CEQA-authorized programmatic approach with project-level detail to analyze the Program.

23-13 The comment asserts that the DPEIR failed to present a sufficient level of analysis of the direct, indirect, cumulative, and growth-inducing and concrete substantial evidence of the Program. The comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

23-13
cont'd

reasons set forth above and in the BVMWC Comments, the DPEIR has failed to present a sufficient level of analysis (e.g., rigorous analysis and concrete substantial evidence) of the direct, indirect, cumulative, and growth-inducing impacts associated with the proposed Project. In lieu of reasoned analysis, BBARWA presents conclusions unsubstantiated and unsupported by empirical or experimental data, scientific authorities or explanatory information, and without presenting either a quantitative or qualitative approach to the manner in which those conclusions were derived. In the absence of that analysis, it is not possible to independently verify those findings or challenge the rationale used by BBARWA to arrive at the conclusions presented in the DPEIR.

23-14

* Based upon the comments reflected herein, BVMWC believes that there is substantial evidence indicating that the DPEIR has failed to include “information relevant to the significant effects of the project, alternatives, and mitigation measures which substantially reduce the effects,” and has failed to disclose that information to other public agencies, interested persons, and organizations as required under CEQA. PRC Section 21003.1(b). As required by PRC Section 21002, “it is the policy of the State that public agencies should not approve projects as proposed if there are feasible alternatives or mitigation measures available which would substantially lessen the significant environmental effects of such projects.” Based upon this requirement, BBARWA is obligated to provide the public with an adequate EIR which fully and impartially discloses the Project’s potential impacts and, based upon a factual accounting of those effects, formulate effective measures to reduce or avoid those impacts. The DPEIR fails to demonstrate BBARWA’s commitment to this mandate.

23-15

4. **Notice of Completion**

As soon as the lead agency completes a draft EIR, it generally must file a Notice of Completion (“NOC”) with the Office of Planning and Research (“OPR”). PRC Section 21161; CCR Section 15085(a). Here, the DPEIR does not appear to include a copy of a NOC. Therefore, it is unclear whether BBARWA has complied with this requirement.

23-16

5. **Public Notice**

At the same time that the lead agency sends a NOC to OPR, the lead agency must also notify the public that a draft EIR is available for review. PRC Section 21092(a). Additionally, agencies releasing draft EIRs should also give additional notice through at least one of the following methods: publication at least one time in a newspaper of general circulation in the area affected by the proposed project; posting of notice on and off site in the same area; and/or direct mailing to owners shown on the latest equalized assessment roll. PRC Section 21092(b)(3); CCR Section 15087(a). Such notices must also be posted for at least thirty (30) days in the office of the county clerk of the county or counties in

- 23-14 The comment asserts that there is the DPEIR fails to include information relevant to the significant effects of the Program, alternatives, and mitigation measures and failed to disclose that information to the public. The comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.
- 23-15 The comment questions whether BBARWA filed a Notice of Completion with the Office of Planning and Research. BBARWA filed the Notice of Completion with the Office of Planning and Research on December 15, 2023, a copy of which can be accessed on their public database.
- 23-16 The comment questions whether BBARWA prepared and posted the DPEIR's Notice of Completion and Notice of Availability ("NOA"). BBARWA filed its Notice of Completion with OPR on December 15, 2023. BBARWA filed the Notice of Availability with OPR on December 21, 2023 for a 45-day review period. The Program review period was extended for an additional 15 days ending on February 20, 2024. Additionally, the NOA was posted in the Big Bear Grizzly on December 21, 2024 and posted on BBARWA's website.

23-16
cont'd

which the project will be located. PRC Section 21092.3. When a public agency files a notice that a draft EIR is available for review, it must be posted within 24 hours of receipt in the county clerk's office. PRC Section 21092.3. The DPEIR fails to specifically indicate whether these requirements were met by BBARWA with respect to the Project.

23-17

It is the intent of CEQA to serve as the means for assessing the environmental impact of proposed agency actions. However, as set forth above, the DPEIR both undermines the legitimacy of BBARWA's environmental and socioeconomic concerns and fails to offer an objective analysis of either the Project or its potential impacts. Therefore, the DPEIR is insufficient in either facilitating informed decisionmaking by BBARWA or fulfilling the minimum standards of adequacy under CEQA and the Guidelines adopted thereunder.

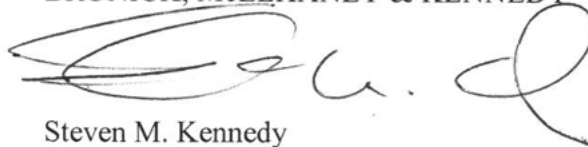

23-18

Further, BVMWC requests that, pursuant to PRC Section 21091(d) and CCR Section 15002(j), BBARWA consider and provide a detailed written response to all comments previously submitted, all comments included herein, and all future comments subsequently added by BVMWC with respect to the Project, and that all of the above be included in the environmental review record for the Project. BVMWC expressly reserves the right to submit additional comments to BBARWA resulting from BVMWC's further review of the DPEIR, BVMWC's receipt of other comments thereto, and BBARWA's responses to such comments, and/or to object to BBARWA's approval of the Project based upon other areas of the law.

BBARWAs anticipated consideration of these comments is greatly appreciated.

Very truly yours,

BRUNICK, McELHANEY & KENNEDY

Steven M. Kennedy

Enclosure

cc: George Hanson, BVMWC General Manager

- 23-17 The comment claims that the DPEIR is insufficient in facilitating informed decision making by BBARWA or fulfilling CEQA's requirements. The comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.
- 23-18 The comment requests BBARWA provide a written response to all comments and reserves the right to submit additional comments. The comment is acknowledged. However, since the comment does not provide any specific comments on the adequacy of the DPEIR; therefore, pursuant to State CEQA Guidelines Section 15088(a), a lead agency is only required to evaluate and respond to comments raised on environmental issues, and thus no further response is necessary.

Re: Draft Program Environmental Impact Report
Replenish Big Bear Program
State Clearinghouse # 2022110595

Ms. Burton,

24-1 Long-term water supply resilience for our region’s people and the environment is a critical value for San Bernardino Valley Municipal Water District (San Bernardino Valley). The Replenish Big Bear Program includes planned release of recycled water into Big Bear Lake to combine with natural runoff. This activity could have impacts on San Bernardino Valley Municipal Water District and to several retail water agencies within its service area including Bear Valley Mutual Water Company, the City of Redlands, and East Valley Water District. San Bernardino Valley requests that through the project development and permitting phases, downstream uses be considered and protected.

24-2 San Bernardino Valley is a wholesale water agency that serves about 700,000 people in Southern California, most of which are disadvantaged. Our role as a regional water agency includes serving as the local State Water Contractor and representing San Bernardino pumpers as the local water master. We strive to serve as a facilitator for innovative collaboration that supports long-term water supply resiliency and maximizes the investments made to-date. Bear Valley Mutual Water Company (“Bear Valley” or “Mutual”) constructed the dam that created Big Bear Lake to provide supplemental water for use in parts of the San Bernardino Valley’s service area. These historical uses compliment the ability for San Bernardino Valley to maximize its Santa Ana River water rights for both groundwater recharge and direct delivery. The water that is released from Big Bear Lake is diverted for use downstream through the Santa Ana River to irrigate historical agriculture, groundwater recharge, and direct delivery for drinking water. This long-standing relationship between mountain and inland communities has resulted in the multi-beneficial use of Big Bear Lake for over 100 years. As additional

**RESPONSE TO COMMENT
LETTER #24
SAN BERNARDINO VALLEY MUNICIPAL WATER DISTRICT**

- 24-1 The comment conveys that the release of recycled water could have impacts on San Bernardino Valley Municipal Water District (Valley District), in addition to the City of Redlands, and East Valley Water District. The comment requests that downstream uses be considered and protected. Refer to the responses to the City of Redlands' comments (Comment Letter #18), specifically Response to Comment 18-4, which states that BBARWA demonstrated that the impacts to the water in Big Bear Lake from discharge of Program Water to the Lake would not result in any significant impacts thereof, and determined that, as a result, impacts to downstream users would be less than significant. **MM HYD-1** would require implementation of a monitoring plan to ensure that the beneficial uses of Big Bear Lake are maintained.
- 24-2 The comment describes Valley District's purpose as a regional water agency, and describes the relationship between Valley District and the utilization of Big Bear Lake water released from the Dam that is diverted for irrigation, groundwater recharge, and direct delivery for drinking water. Refer to Response to Comment 24-1 and 18-4, which affirm that downstream uses of this water will be protected through implementation of the proposed Program.

24-2 cont'd | sustainability efforts are implemented, we request that these existing downstream uses are protected through continued compliance with current regulations allowing for varied uses of this critical surface water source.

24-3 | Currently, the use of water in Big Bear Lake for irrigation of crops and human consumption, through treatment for drinking water are recognized in Section 4.11.2.2 as the water quality beneficial use designations AGR and MUN, assigned by the Santa Ana Regional Water Quality Control Board, and shown in Table 4-11.1 of the Draft Program Environmental Impact Report for the Replenish Big Bear Program.

24-4 | Thank you for allowing San Bernardino Valley this opportunity to comment on the Replenish Big Bear Program Draft Program Environmental Impact Report. For additional information please contact Michael Plinski, Chief of Water Resources at 909-387-9230, e-mail: michaelp@sbvmwd.com.

Sincerely,

Heather Dyer, MS, MBA

- 24-3 The comment notes that the SARWQCB assigned Big Bear Lake water used with beneficial uses including AGR and MUN, and acknowledges that the DPEIR identifies these same uses.
- 24-4 The contact information provided in this comment will be retained in the project file. The comment is noted and will be made available to the BBARWA decision-makers as part of the FPEIR package prior to a decision on the proposed Program.

ERRATA

The following are revisions to the DPEIR. These revisions are minor modifications and clarifications and do not change the significance of any of the environmental issue conclusions within the DPEIR. The revisions are listed by page number. DPEIR text that is shown is indented underneath explanatory information. All additions to the text are underlined (underlined) and all deletions from the text are stricken (stricken).

Please note that the FPEIR will incorporate all of the changes provided in this Errata, as well as those changes made to mitigation measures in the Responses to Comments. The changes to the DPEIR contained in the Responses to Comments are not repeated below, but will be provided as part of the FPEIR.

Appendix 13 has been replaced with an updated Cultural Resources Investigation that includes the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option, as this area was surveyed during the period in which the DPEIR was out for public review. Thus, the changes presented in this Errata all pertain to updating the document to reflect the findings of this updated Cultural Resources Investigation, which is that the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option did not contain any evidence of significant cultural resources. The mitigation measures contained in the DPEIR are sufficient to protect unanticipated discovery of cultural resources during ground disturbing activities.

Pages 1-39 to 1-41...

1.5 EXECUTIVE SUMMARY IMPACTS TABLE

**Table 1.5-1
SUMMARY OF IMPACTS AND AVOIDANCE, MINIMIZATION AND MITIGATION MEASURES
DISCUSSED IN THIS DPEIR**

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
CULTURAL RESOURCES	
<p>CUL-3 If the Sand Canyon Monitoring Wells are proposed within undisturbed sites <u>and/or</u> a site that will require substantial earthmoving activities and/or excavation, <u>and/or</u> the implementing agency is seeking state or federal funding, the Implementing Agency shall complete a follow-on cultural resources report (Phase I Cultural Resources Investigation) regardless of whether implementing agency is seeking state or federal funding.</p> <p>Where a Phase I Cultural Resources Investigation is required, the following phases of identification, evaluation, mitigation, and monitoring shall be followed for the Sand Canyon Monitoring Wells:</p> <ol style="list-style-type: none"> 1. <u>Phase I (Identification)</u>: A Phase I Investigation to identify historical, archaeological, or paleontological resources in a project site shall include the following research procedures, as appropriate: <ul style="list-style-type: none"> • Focused historical/archaeological resources records searches at SCCIC and/or EIC, depending on the project location, and paleontological resources records searches by NHMLAC, SBCM, and/or the Western Science Center in Hemet; • Historical background research, geoarchaeological profile analysis, and paleontological literature review; • Consultation with the State of California Native American Heritage Commission, Native American tribes in the surrounding area in accordance with Assembly Bill 52 (AB 52), the Native American Historic Resource Protection Act, pertinent local government agencies, and local historic preservation groups; 	Implementing Agency

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<ul style="list-style-type: none"> • Field survey of the Program Area by qualified professionals of the pertinent discipline and at the appropriate level of intensity as determined on the basis of sensitivity assessment and site conditions; and • Field recordation of any cultural resources encountered during the survey and proper documentation of the resources for incorporation into the appropriate inventories or databases. <p>2. <u>Phase II (Evaluation)</u>: If cultural resources are encountered in a project site and cannot be avoided, a Phase II investigation shall be required to evaluate the potential significance of the resources in accordance with the statutory/regulatory framework outlined above. A typical Phase II study consists of the following research procedures:</p> <ul style="list-style-type: none"> • Preparation of a research design to discuss the specific goals and objectives of the study in the context of important scientific questions that may be addressed with the findings and the significance criteria to be used for the evaluation, and to formulate the proper methodology to accomplish such goals; • In-depth exploration of historical, archaeological, or paleontological literature, archival records, as well as oral historical accounts for information pertaining to the cultural resources under evaluation; • Fieldwork to ascertain the nature and extent of the archaeological/paleontological remains or resource-sensitive sediments identified during the Phase I study, such as surface collection of artifacts, controlled excavation of units, trenches, and/or shovel test pits, and collection of soil samples; and • Laboratory processing and analyses of the cultural artifacts, fossil specimens, and/or soil samples for the proper recovery, identification, recordation, and cataloguing of the materials collected during the fieldwork and to prepare the assemblage for permanent curation, if warranted. <p>3. <u>Phase III (Mitigation/Data Recovery)</u>: For resources that prove to be significant under the appropriate criteria, mitigation of potential project impact is required. The first option is avoidance by selecting and implementing the Sand Canyon Monitoring Wells at an alternative site or selecting an alternative Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option without significant cultural or paleontological resources. Depending on the characteristics of each resource type and the unique aspects of significance for each individual resource, mitigation may be accomplished through a variety of different methods, which shall be determined by a qualified archaeologist, paleontologist, historian, or other applicable professional in the "cultural resources" field. Typical mitigation for historical, archaeological, or paleontological resources, however, may focus on the following procedures, aimed mainly at the preservation of physical and/or archival data about a significant cultural resource that would be impacted by the project:</p> <ul style="list-style-type: none"> • Data recovery through further excavation at an archaeological site or a paleontological locality to collect a representative sample of the identified remains, followed by laboratory processing and analysis as well as preparation for permanent curation; • Comprehensive documentation of architectural and historical data about a significant building, structure, or object using methods comparable to the appropriate level of the Historic American Buildings Survey (HABS) and the Historic American Engineering Record (HAER) for permanent curation at a repository or repositories that provides access to the public; and • Adjustments to project plans to minimize potential impact on the significance and integrity of the resource(s) in question. <p>4. <u>Phase IV (Monitoring)</u>: At locations that are considered sensitive for subsurface deposits of undetected archaeological or paleontological remains, all earth-moving operations shall be monitored continuously or periodically, as warranted, by qualified professional practitioners. Archaeological monitoring programs shall be coordinated with the nearest Native American groups, who may wish to participate, as put forth in MMs TCR-1 through TCR-3.</p>	

...

4.6 CULTURAL RESOURCES

4.6.1 Introduction

The analysis herein, while prepared under a Programmatic DEIR, has been provided as the project level for all of the facilities proposed under this Program, with one exception: the monitoring wells at Sand Canyon. ~~Additionally, access to private/fenced properties between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option was not possible, as such the area was not able to be surveyed for cultural resources (refer to Figure 4.6-1a).~~ However, note that the whole of the Program Area has been researched for the potential for unearthing cultural resources utilizing the research methods presented in Cultural Resources Report prepared by CRM TECH provided as **Appendix 13**, Volume 2 to this DPEIR. Sufficient detail for all other projects proposed under this Program is available for project level impact forecasts.

Note that Figure 4.6-1a is no longer needed...

4.6.2 Environmental Setting

Page 4-311...

The APE that was explored in the Cultural Resources Report includes the following Program facilities: the BBARWA WWTP Upgrades, solar, Solar Evaporation Ponds (at BBARWA WWTP site), all pipeline alignments ~~(except the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option)~~, all pump stations, the monitoring wells at the BBARWA WWTP, and the Sand Canyon Conveyance Pipeline Discharge Outlet. The APE does not include the up to two monitoring wells that would be installed downstream of the Sand Canyon discharge point because these monitoring well sites have not yet been identified. ~~Further, the APE does not include the portion of the Meadow Lane Pipeline Alignment Option between Meadow Lane and Mountain View Boulevard because the area requires encroachment onto private/fenced property that could not be arranged prior to the publication of this DPEIR.~~

Field Survey

The field survey of the Program APE was carried out in several phases. On April 21, 2023, CRM TECH field director Daniel Ballester and project archaeologist Hunter O'Donnell carried out the initial survey using both reconnaissance- and intensive-level methods. The reconnaissance survey primarily covered the pipeline alignments and was conducted by driving along the paved roadways along the proposed pipeline alignment and visually inspecting the surrounding area for any indication of cultural resources. The intensive-level survey was conducted on foot in areas where ground surface was exposed, such as along unpaved roads and one pipeline alignment located south of Shay Road leading to Shay Pond.

On April 28, 2023, Hunter O'Donnell of CRM TECH conducted the survey of the BBARWA treatment plant and the surrounding pipeline alignments to the best of possibility as much of the western end and northeast corner of the facility were inundated by waters from the adjacent Baldwin Lake. Portions of nearby pipeline alignments were also inaccessible due to flooding. O'Donnell was able to survey the unflooded portion of the plant at an intensive level and inspect the structures, basins, and ponds situated at higher elevations.

As additional facility sites and pipeline alignments were identified in the design process and added to the APE, Ballester and O'Donnell of CRM TECH surveyed these areas on June 21 and July 19, 2023, and January 9, 2024, using similar methods. In this way, the ground surface in the entire APE was systematically and carefully examined for any evidence of human activities dating to the prehistoric or historic period (i.e., 50 years ago or older). Other than areas obscured by pavement or flooding, visibility of the native ground surface ranged from poor to good depending on the density of the vegetation growth (Figure 4.6-1).

During the field survey, the BBARWA WWTP was observed as containing both historical and modern components, with the former sufficiently consistent in appearance to their late-1960s origin to warrant recordation and further study as a potential cultural resource. The entire WWTP was subsequently recorded into CHRIS under the temporary designation of Site 3969-1H, pending assignment of a permanent identification number by the SCCIC. Site 3969-1H is discussed further below, and additional information is provided in the site record forms in Appendix 4 of the Cultural Resources Report provided as **Appendix 13, Volume 2** to this DPEIR.

...

Program Category 1: Conveyance Pipelines

Page 4-340...

Construction: An evaluation of cultural resource sensitivity of the various pipeline alignments (to Big Bear Lake, to Shay Pond, to Sand Canyon, and to convey brine at the BBARWA WWTP) is presented in the Cultural Resources Report provided as **Appendix 13, Volume 2** of this DPEIR. ~~However, the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option was not surveyed, and is therefore not part of the APE because surveyal was not possible due to encroachment upon private/fenced property [refer to Figure 4.6-4a].~~ As described under Cultural Resource Study Conclusions, above, of the 17 cultural resources identified in the APE, the 15 historic-period sites do not appear to qualify as “historic properties” or “historical resources,” and the prehistoric site (36-002060) is no longer extant within the APE boundaries. Furthermore, the proposed conveyance pipeline alignment alternative to Big Bear Lake that traverses through Baldwin Lake was determined to not have an adverse effect on Baldwin Lake, a “historical resource” under CEQA and a presumed “historic property” under Section 106. This is because, as described above, given the limited involvement of the unaltered lakebed in the project plans—in that the Program would ensure that the lakebed is returned to its original condition or better once the pipeline is installed, should this alignment alternative be the preferred alternative—and the previously altered cultural landscape in this portion of the APE as a result of the installation of the BBARWA WWTP within the former Baldwin Lake lakebed, the undertaking has little potential to affect the existing characteristics of Baldwin Lake.

...

Pages 4-341 to 4-342...

The remaining pipeline alignments (~~except the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option~~), while traversing through several roadways that have been recorded as historic, would not impact any historical resources, as the roadways identified within the APE do not appear to qualify as “historic properties” or “historical resources,” and furthermore, the prehistoric site (36-002060) is no longer extant within

the APE boundaries. Furthermore, according to **Subsection 4.6.3.2, Geoarchaeological Sensitivity Analysis** presented herein, the likelihood of encountering intact, potentially significant prehistoric cultural remains within the vertical APE appears to be relatively low. Therefore, CRM TECH recommends a finding of No Impact regarding “historical resources.” No further cultural resources investigation is recommended for the conveyance facilities ~~except for the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option, which is discussed in further detail below,~~ unless construction plans undergo such changes as to include areas not covered by the Cultural Resources Report. However, if buried cultural materials are discovered during earth-moving operations associated with the project, and these materials are adversely impacted, a potentially significant impact on archaeological or historical resources could occur. Thus, mitigation is required to ensure that all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds. Furthermore, **MM CUL-2** would require the implementing agency to adhere to adaptive management procedures pertaining to treatment of cultural resources that may be accidentally discovered during earthmoving activities. **MM CUL-5** would require an archaeological monitor to be present at each of the Program Component sites, at the discretion of the YSMN, at the request of the Tribe as part of the AB 52 consultation. This measure would further ensure that historical, archeological, and prehistoric resources are treated appropriately if unearthed as part of the implementation of the Program. As such, **MMs CUL-2 and CUL-5** below must be implemented to ensure impacts would be less than significant for the conveyance facilities discussed above.

~~Forecasting impacts to specific historical or archaeological at the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option (refer to **Figure 4.6-1a**) would be speculative. Previously unknown and unrecorded cultural resources may be unearthed during excavation and grading activities for the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option. If previously unknown potentially unique buried archaeological resources are uncovered during excavation or construction without mitigation, significant impacts could occur. Therefore, once access to the private/fenced property can be achieved for the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option, a site specific study to identify potentially significant historical and archaeological resources would be required, such as a Phase I Cultural Resources Investigation. An additional study would minimize potential impacts to historical and archaeological resources.~~

~~Because the Program has been awarded Federal grants, compliance with NEPA is also necessary, and it is therefore anticipated that, where the funding is applicable to the Meadow Lane Pipeline Alignment Option, in order to obtain Federal or State funding, a Phase I Cultural Resources Investigation that covers each site must be prepared because this is a requirement in order to be eligible for State or Federal funding. Without this additional investigation, a potentially significant impact on archaeological or historical resources could occur. Further MMs are provided below that address the potential for multiple phases of studies that may be necessary to properly identify and evaluate potential cultural resources for the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option. **MM CUL-3** would ensure that a follow-on Phase I Cultural Resources Investigation is required to identify potential cultural resources. This **MM** includes several phases or steps beyond the completion of a Phase I Cultural Resources Investigation that would cover the identification, evaluation, mitigation, and monitoring associated with a given project where resources may be located. This would ensure that adequate mitigation is provided in the event that significant cultural resources are located within the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option.~~

~~MM-CUL-4~~ would ensure that, after each phase of the studies required by ~~MM-CUL-3~~ has been completed, where required, a complete report on the methods, results, and final conclusions of the research procedures is prepared and submitted to SCCIC, EIC, NHMLAC, and/or SBCM. This would ensure that any discoveries are properly documented for future researchers that may seek information regarding the Program Infrastructure project site. These mitigation measures would ensure that impacts to any cultural resources are fully addressed and minimized to a level of less than significant with the implementation of mitigation.

...

Combined Program Categories

Pages 4-347 to 4-348...

CUL-3: If the Sand Canyon Monitoring Wells are proposed within undisturbed sites and/or a site that will require substantial earthmoving activities and/or excavation, and/or the implementing agency is seeking State or Federal funding, the implementing agency shall complete a follow-on cultural resources report (Phase I Cultural Resources Investigation) regardless of whether implementing agency is seeking State or Federal funding.

Where a Phase I Cultural Resources Investigation is required, the following phases of identification, evaluation, mitigation, and monitoring shall be followed:

1. ***Phase I (Identification):*** A Phase I Investigation to identify historical, archaeological, or paleontological resources in a project site shall include the following research procedures, as appropriate:
 - *Focused historical/archaeological resources records searches at SCCIC and/or EIC, depending on the project location, and paleontological resources records searches by NHMLAC, SBCM, and/or the Western Science Center in Hemet;*
 - *Historical background research, geoarchaeological profile analysis, and paleontological literature review;*
 - *Consultation with the NAHC, Native American tribes in the surrounding area in accordance with AB 52, pertinent local government agencies, and local historic preservation groups;*
 - *Field survey of the Program Area by qualified professionals of the pertinent discipline and at the appropriate level of intensity as determined on the basis of sensitivity assessment and site conditions;*
 - *Field recordation of any cultural resources encountered during the survey and proper documentation of the resources for incorporation into the appropriate inventories or databases.*
2. ***Phase II (Evaluation):*** If cultural resources are encountered in a project site and cannot be avoided, a Phase II investigation shall be required to evaluate the potential significance of the resources in accordance with the statutory/regulatory framework outlined above. A typical Phase II study consists of the following research procedures:
 - *Preparation of a research design to discuss the specific goals and objectives of the study in the context of important scientific questions that may be addressed with the findings and the significance criteria to be used for the evaluation, and to formulate the proper methodology to accomplish such goals;*
 - *In-depth exploration of historical, archaeological, or paleontological literature, archival records, as well as oral historical accounts for information pertaining to the cultural resources under evaluation;*
 - *Fieldwork to ascertain the nature and extent of the archaeological/paleontological remains or resource-sensitive sediments identified during the Phase I study, such*

as surface collection of artifacts, controlled excavation of units, trenches, and/or shovel test pits, and collection of soil samples;

- *Laboratory processing and analyses of the cultural artifacts, fossil specimens, and/or soil samples for the proper recovery, identification, recordation, and cataloguing of the materials collected during the fieldwork and to prepare the assemblage for permanent curation, if warranted.*

3. ***Phase III (Mitigation/Data Recovery):** For resources that prove to be significant under the appropriate criteria, mitigation of potential project impact is required. The first option is avoidance by selecting and implementing the Sand Canyon Monitoring Wells at an alternative site ~~or selecting an alternative Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option~~ without significant cultural or paleontological resources. Depending on the characteristics of each resource type and the unique aspects of significance for each individual resource, mitigation may be accomplished through a variety of different methods, which shall be determined by a qualified archaeologist, paleontologist, historian, or other applicable professional in the “cultural resources” field. Typical mitigation for historical, archaeological, or paleontological resources, however, may focus on the following procedures, aimed mainly at the preservation of physical and/or archival data about a significant cultural resource that would be impacted by the project:*

- *Data recovery through further excavation at an archaeological site or a paleontological locality to collect a representative sample of the identified remains, followed by laboratory processing and analysis as well as preparation for permanent curation;*
- *Comprehensive documentation of architectural and historical data about a significant building, structure, or object using methods comparable to the appropriate level of the HABS and HAER for permanent curation at a repository or repositories that provides access to the public;*
- *Adjustments to project plans to minimize potential impact on the significance and integrity of the resource(s) in question.*

4. ***Phase IV (Monitoring):** At locations that are considered sensitive for subsurface deposits of undetected archaeological or paleontological remains, all earth-moving operations shall be monitored continuously or periodically, as warranted, by qualified professional practitioners. Archaeological monitoring programs shall be coordinated with the nearest Native American groups, who may wish to participate, as put forth in MMs TCR-1 through TCR-3.*

...

Page 4-349...

MM CUL-1 would exclude highly disturbed sites from requiring further cultural resource evaluation, in addition to those sites for which a cultural resource evaluation has already been prepared (all Program facilities except the Sand Canyon Monitoring Wells ~~and the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option~~), unless the implementing agency is seeking additional State funding or Federal funding for the Program. Furthermore, **MM CUL-2** would require the implementing agency to adhere to adaptive management procedures pertaining to treatment of cultural resources that may be accidentally discovered during earthmoving activities.

MM CUL-3 would ensure that the Sand Canyon Monitoring Wells that are located within undisturbed areas, within a site that will require substantial earthmoving activities and/or excavation (~~i.e. the area between Meadow Lane and Mountain View Boulevard as part of the Meadow Lane Pipeline Alignment Option~~), and/or where the implementing agency is seeking State funding, will require a follow-on Phase I Cultural Resources Investigation. This **MM** includes

several phases or steps beyond the completion of a Phase I Cultural Resources Investigation that would cover the identification, evaluation, mitigation, and monitoring associated with a given project where resources may be located. This would ensure that adequate mitigation is provided in the event that significant cultural resources are located within the Sand Canyon Monitoring Wells sites.

REPLENISH BIG BEAR PROGRAM
MITIGATION MONITORING AND REPORTING PROGRAM**

Mitigation Measure	Implementation Schedule	Verification
<p>Biological Resources</p> <p>BIO-7 Prior to implementation of the <u>Sand Canyon Monitoring Wells (once the final locations have been selected), and prior to the replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8)</u>, a site-specific biological resources assessment shall be conducted by a qualified biologist familiar with Big Bear Valley flora and fauna. This survey shall be conducted in accordance with appropriate standards by a qualified biologist/ ecologist. If sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the California Natural Diversity Database (CNDDDB) will be notified and the following subsequent mitigation actions will be taken:</p> <p>a. BBARWA <u>The Implementing Agency</u> shall provide compensation for sensitive habitat acreage lost by acquiring and protecting in perpetuity (through property or mitigation bank credit acquisition) habitat for the sensitive species at a ratio of not less than 1:1 for habitat lost, <u>with the ultimate compensatory mitigation ratio being determined through negotiation with USFWS and/or CDFW, and never less than 1:1</u>. The property acquisition shall include the presence of at least one animal or plant per animal or plant lost at the development site to compensate for the loss of individual sensitive species.</p> <p>b. The final mitigation may differ from the above values based on negotiations between the project proponent and USFWS and CDFW for any incidental take permits for listed species. BBARWA and/or the implementing agency shall retain a copy of the incidental take permit as verification that the mitigation of significant biological resource impacts at a project site with sensitive biological resources has been accomplished.</p> <p>c. Preconstruction botanical surveys for special-status plant communities and special- status plant species will be conducted in areas that were not previously surveyed because of access or timing issues or project design changes; pre-construction surveys for special-status plant communities and special-status plant species will be conducted before the start of ground-disturbing activities during the appropriate blooming period(s) for the species. If special-status plants or plant communities are identified, the following hierarchy of actions shall be taken: a) find an alternative site; b) avoid the plants and maintain them onsite after completing the project; or c) provide compensatory mitigation offsite.</p>	<p>The survey(s) shall be conducted prior to construction with sufficient time to allow for consultation where sensitive species are most anticipated to be encountered, if anticipated to be encountered at all. Where applicable, compensatory habitat shall be acquired prior to operation of the facility.</p>	<p>A copy of the survey(s) and any acquisition paperwork pertaining to compensatory habitat shall be retained in the project file. Verification of implementation shall be based on field inspections by the Implementing Agency, as well as by retaining the Incidental Take Permit (ITP). Field notes from inspections shall be retained in the project file.</p>

Mitigation Measure	Implementation Schedule	Verification
<p>Biological Resources</p> <p>BIO-26 Any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation. Mitigation can be provided by restoration of temporary impacts, enhancement of existing resources, or purchasing into any authorized mitigation bank or in-lieu fee program; by selecting a site of comparable acreage near the site and enhancing it with a native riparian habitat or invasive species removal in accordance with a habitat mitigation plan approved by regulatory agencies; or by acquiring sufficient compensating habitat to meet regulatory agency requirements. Typically, regulatory agencies require mitigation for impacts to jurisdictional waters without any riparian or wetland habitat shall to be mitigated at a minimum 1:1 ratio, with the ultimate compensatory mitigation ratio being determined through negotiation with regulatory agency, and never at a rate of less than 1:1. For loss of any riparian or other wetland areas, the mitigation ratio will begin at 2:1, and the ratio will rise based on the type of habitat, habitat quality, and presence of sensitive or listed plants or animals in the affected area. This increase in ratio will be determined by the regulatory agency, and must be deemed sufficient by the regulatory agency issuing the permit to compensate for/offset the impacts to the jurisdictional waters and supported species and habitats therein. A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.</p>	<p>If necessary, the regulatory permits shall be obtained prior to ground disturbance within the jurisdictional area and the conditions of the regulatory permits shall be implemented as defined in the regulatory permits.</p>	<p>A copy of the regulatory permits shall be retained in the project file(s), and verification that all conditions have been implemented shall be retained in the project file.</p>

 MITIGATION MONITORING AND REPORTING PROGRAM**

Mitigation Measure	Implementation Schedule	Verification
<p>Hydrology and Water Quality</p> <p>HYD-5: Prior to commencement of construction of project facilities, the implementing agency shall be required to either:</p> <p>(1) Prepare a No Net Discharge Report demonstrating that within each facility surface runoff shall be collected and retained (for use onsite) or detained and percolated into the ground on the site such that site development results in no net increase in offsite stormwater flows. Detainment shall be achieved through Low Impact Development techniques whenever feasible, and shall include techniques that remove the majority of urban storm runoff pollutants, such as petroleum products and sediment. The purpose of this measure is to remove the onsite contribution to cumulative urban storm runoff and ensure the discharge from the sites is treated to reduce contributions of urban pollutants to downstream flows and to groundwater; or, where it is not feasible to eliminate stormwater flows off of a site or where otherwise appropriate, the implementing agency shall:</p> <p>(2) Prepare a grading and drainage plan that identifies anticipated changes in flow that would occur on site and minimizes any potential increases in discharge, erosion, or sedimentation potential in accordance with applicable regulations and requirements for the County and/or the City in which the facility would be located. In addition, all new drainage facilities shall be designed in accordance with standards and regulations. The plan shall identify and implement retention basins, BMPs, and other measures to ensure that potential increases in storm water flows and erosion would be minimized, in accordance with local requirements.</p>	<p>The No Net Discharge Report or Grading Plan and Drainage Plan shall be developed prior to construction, and the measures called for shall be implemented during construction and shall be included in the construction contract as a contract specification.</p>	<p>A copy of the No Net Discharge Report or Grading Plan and, Drainage Plan and construction contract shall be retained in the project file. Verification of implementation shall be based on field inspections by the Implementing Agency. Field notes from inspections shall be retained in the project file.</p>

Mitigation Measure	Implementation Schedule	Verification
<p>Land Use / Planning</p> <p>LU-1: Following selection of sites for future Replenish Big Bear Program related facilities, each site and associated facility shall be evaluated for potential incompatibility with adjacent existing or proposed land uses. Where future facility operations can create significant incompatibilities (lighting, noise, use of hazardous materials, traffic, etc.) with adjacent uses, an alternative site shall be selected, or subsequent CEQA documentation shall be prepared that identifies the specific project design features or MMs that will be utilized to reduce potential incompatible activities or effects to below significance thresholds established in the general plan for the jurisdiction where the facility will be located.</p>	<p>Site evaluation should be completed by the Implementing Agency during site selection, prior to construction. Where applicable, subsequent CEQA documentation shall be completed prior to initiation of construction, during site design. The measures generated in the subsequent CEQA documentation shall be incorporated into individual project design specifications, which shall be included in the construction contract as a contract specification and implemented by the contractor during construction.</p>	<p>Correspondence related to site selection shall be retained in the project file(s). Where applicable, a copy of the subsequent CEQA documentation for the individual project shall be retained in the project file. A copy of the construction contract including any land use related measures generated by the subsequent CEQA documentation (where applicable) shall be retained in the project file(s). Verification of implementation shall be based on field inspections by the Implementing Agency. Field notes documenting verification shall be retained in the project file.</p>

<p><i>Tribal Cultural Resources</i> TCR-1 <u>Tribal Monitoring</u> Due to the heightened cultural sensitivity of the proposed Program Area in Big Bear Valley, at the discretion of the Tribe, a Tribal monitor shall be present for all ground-disturbing activities that occur within the proposed Program Area (which includes, but is not limited to, tree/shrub removal and planting, clearing/grubbing, grading, excavation, trenching, compaction, fence/gate removal and installation, drainage and irrigation removal and installation, hardscape installation [benches, signage, boulders, walls, seat walls, fountains, etc.], and archaeological work). At the discretion of the Tribe, a sufficient number of Tribal monitors shall be present each work day to ensure that simultaneously occurring ground disturbing activities receive thorough levels of monitoring coverage. A Monitoring and Treatment Plan that is reflective of the project mitigation (“Cultural Resources” and “Tribal Cultural Resources”) shall be completed by the consultant, as detailed within CUL-1, and submitted to the Lead Agency for dissemination to the YSMN Cultural Resources Management Department. Once all parties review and agree to the plan, it shall be adopted by the Lead Agency – the plan must be adopted prior to permitting for the project. Any and all findings will be subject to the protocol detailed within the Monitoring and Treatment Plan.</p>	<p>Any response to exposed resources shall occur during construction. The Monitoring and Treatment Plan (MTP) shall be developed prior to the commencement of construction. Tribal monitoring shall occur during construction, and shall be included as a requirement in the construction contract, as shall the stipulations of the MTP. Reports documenting management and findings for accidentally exposed resources shall be completed within one year of the discovery.</p>	<p>A copy of the contract with the Tribal Monitor(s) and documentation of their presence during construction shall be retained in the project file. A copy of the MTP shall be retained in the project file. Verification of implementation shall be based on field inspections by the Implementing Agency that verify the archaeological monitoring program is being implemented by the contractor as required in this measure. Field notes documenting verification shall be retained in the project file.</p>

<p><i>Tribal Cultural Resources</i></p> <p>TCR-2 <u>Treatment of Cultural Resources</u> If a pre-contact cultural resource is discovered during archaeological presence/absence testing, the discovery shall be properly recorded and then reburied in situ. A research design shall be developed by the archaeologist that shall include a plan to evaluate the resource for significance under CEQA criteria. Representatives from the YSMN Cultural Resources Management Department, the archaeologist, and the Lead Agency shall confer regarding the research design, as well as any testing efforts needed to delineate the resource boundary. Following the completion of evaluation efforts, all parties shall confer regarding the archaeological significance of the resource, its potential as a TCR, avoidance (or other appropriate treatment) of the discovered resource, and the potential need for construction monitoring during project implementation. Should any significant resource and/or TCR not be a candidate for avoidance or preservation in place, and the removal of the resource(s) is necessary to mitigate impacts, the research design shall include a comprehensive discussion of sampling strategies, resource processing, analysis, and reporting protocols/obligations. Removal of any cultural resource(s) shall be conducted with the presence of a Tribal monitor representing the Tribe, unless otherwise decided by YSMN. All plans for analysis shall be reviewed and approved by the implementing agency and YSMN prior to implementation, and all removed material shall be temporarily curated on-site. It is the preference of YSMN that removed cultural material be reburied as close to the original find location as possible. However, should reburial within/near the original find location during project implementation not be feasible, then a reburial location for future reburial shall be decided upon by YSMN, the landowner, and the Lead Agency, and all finds shall be reburied within this location. Additionally, in this case, reburial shall not occur until all ground-disturbing activities associated with the project have been completed, all monitoring has ceased, all cataloguing and basic recordation of cultural resources have been completed, and a final monitoring report has been issued to Lead Agency, California Historical Resources Information System (CHRIS), and YSMN. All reburials are subject to a reburial agreement that shall be developed between the landowner and YSMN outlining the determined reburial process/location, and shall include measures and provisions to protect the reburial area from any future impacts (vis a vis project plans, conservation/preservation easements, etc.).</p> <p>Should it occur that avoidance, preservation in place, and on-site reburial are not an option for treatment, the landowner shall relinquish all ownership and rights to this material and confer with</p>	<p>Any response to exposed resources shall occur during construction. The stipulations set forth by this measure shall be included in the construction contract. Reports documenting management and findings for accidentally exposed resources shall be completed within one year of the discovery.</p>	<p>A copy of the reports of any findings as well as the construction contract shall be retained in the project file. Verification of implementation shall be based on field inspections by the Implementing Agency that verify the archaeological monitoring program is being implemented by the contractor as required in this measure. Field notes documenting verification shall be retained in the project file.</p>

1.6.3	Groundwater Recharge at Greenspot and Sand Canyon Alternative.....	1-61
1.6.4	Discussion.....	1-62
1.7	Areas of Controversy	1-65

Chapter 2 – INTRODUCTION

2.1	Background.....	2-1
2.1.1	Environmental Setting.....	2-1
2.1.2	CEQA Process Background.....	2-1
2.2	Purpose and Use of an EIR	2-2
2.3	Scope and Content of this EIR.....	2-4
2.4	DPEIS Format and Organization.....	2-5
2.5	Availability of the Replenish Big Bear Program DPEIR.....	2-5
2.6	Review Process	2-6
2.7	CEQA Responsible Agencies	2-8

Chapter 3 – PROJECT DESCRIPTION

3-1	Introduction	3-1
3.2	Program Location.....	3-1
3.3	Program Purpose and Objectives	3-19
3.3.1	Program Characteristics	3-20
3.4	Program Background and Existing Conditions	3-33
3.4.1	Groundwater Management in Big Bear Valley.....	3-33
3.4.2	Water Demand in Big Bear Valley	3-37
3.4.3	Big Bear Lake Water Management.....	3-37
3.4.4	Wastewater Characteristics and Facilities	3-40

3.4.5	Shay Pond and Stickleback Fish Habitat.....	3-42
3.4.6	Lucerne Valley Site.....	3-44
3.5	Projected Uses of Recycled Water Generated by the Program.....	3-45
3.5.1	Stanfield Marsh and Big Bear Lake Discharge – Program Overview	3-45
3.5.2	Shay Pond Discharge Project – Program Overview	3-46
3.5.3	Sand Canyon Recharge Project – Program Overview.....	3-46
3.6	Wastewater Treatment Upgrades	3-49
3.6.1	Basin Plan Water Quality Objectives	3-49
3.6.2	Groundwater Recharge Requirements	3-51
3.6.3	BBARWA WWTP Treatment Upgrades.....	3-51
3.6.4	Brine Disposal – Solar Evaporation Ponds.....	3-62
3.6.5	Treated Water Storage and Distribution	3-63
3.7	Summary of All Facilities.....	3-66
3.7.1	Replenish Big Bear Program Components Overview	3-66
3.7.2	Program Category 1: Conveyance Pipelines.....	3-71
3.7.3	Program Category 2: Ancillary Facilities Including Monitoring Wells and Pump Stations	3-72
3.7.4	Program Category 3: Solar Evaporation Ponds Project	3-74
3.7.5	Program Category 4: BBARWA WWTP Upgrades Project.....	3-75
3.7.6	Other Physical Changes to the Environment.....	3-76
3.8	Entitlements, Approvals and Other Agency Participation	3-77
3.9	CEQA Responsible Agencies	3-78
3.10	Uses of this Environmental Impact Report.....	3-79

Chapter 4 – ENVIRONMENTAL IMPACT EVALUATION

4.1	Background.....	4-1
4.2	Aesthetics.....	4-5
4.2.1	Introduction	4-5
4.2.2	Environmental Setting.....	4-5
4.2.3	Regulatory Setting	4-9
4.2.4	Thresholds of Significance.....	4-17
4.2.5	Potential Impacts	4-18
4.2.6	Cumulative Impacts	4-40
4.2.7	Significant and Unavoidable Impacts.....	4-40
4.3	Agriculture and Forestry Resources.....	4-41
4.3.1	Introduction	4-41
4.3.2	Environmental Setting.....	4-41
4.3.3	Regulatory Setting	4-47
4.3.4	Thresholds of Significance.....	4-52
4.3.5	Potential Impacts	4-52
4.3.6	Cumulative Impacts	4-59
4.3.7	Unavoidable Adverse Impacts	4-60
4.4	Air Quality.....	4-61
4.4.1	Introduction	4-61
4.4.2	Environmental Setting.....	4-61
4.4.3	Regulatory Setting	4-73
4.4.4	Thresholds of Significance.....	4-78
4.4.5	Potential Impacts	4-79
4.4.6	Cumulative Impacts	4-162
4.4.7	Unavoidable Significant Impacts.....	4-163
4.5	Biological Resources.....	4-164
4.5.1	Introduction	4-164
4.5.2	Environmental Setting.....	4-164
4.5.3	Regional Special Status Species and Habitat of Concern.....	4-179

	4.5.4	Regulatory Setting	4-191
	4.5.5	Thresholds of Significance.....	4-200
	4.4.6	Potential Impacts	4-204
	4.5.7	Unavoidable Adverse Impacts	4-308
4.6		Cultural Resources.....	4-310
	4.6.1	Introduction	4-310
	4.6.2	Environmental Setting.....	4-312
	4.6.3	Sensitivity Assessment	4-329
	4.6.4	Regulatory Setting	4-331
	4.6.5	Thresholds of Significance.....	4-337
	4.6.6	Potential Impacts	4-338
	4.6.7	Unavoidable Adverse Impacts	4-354
4.7		Energy.....	4-355
	4.7.1	Introduction	4-355
	4.7.2	Environmental Setting.....	4-355
	4.7.3	Regulatory Setting	4-362
	4.7.4	Thresholds of Significance.....	4-368
	4.7.5	Potential Impacts	4-372
	4.7.6	Cumulative Impacts	4-429
	4.7.7	Unavoidable Significant Impacts.....	4-429
4.8		Geology and Soils	4-430
	4.8.1	Introduction	4-430
	4.8.2	Environmental Setting.....	4-430
	4.8.3	Regulatory Setting	4-443
	4.8.4	Thresholds of Significance.....	4-448
	4.8.5	Potential Impacts	4-449
	4.8.6	Cumulative Impacts	4-481
	4.8.7	Significant and Unavoidable Impacts.....	4-481
4.9		Greenhouse Gases / Global Climate Change.....	4-482
	4.9.1	Introduction	4-482
	4.9.2	Environmental Setting.....	4-482
	4.9.3	Regulatory Setting	4-491
	4.9.4	Thresholds of Significance.....	4-510
	4.9.5	Potential Impacts	4-511
	4.9.6	Cumulative Impacts	4-534
	4.9.7	Unavoidable Significant Adverse Impacts.....	4-535
4.10		Hazards and Hazardous Materials.....	4-536
	4.10.1	Introduction	4-536
	4.10.2	Environmental Setting.....	4-536
	4.10.3	Regulatory Setting	4-554
	4.10.4	Thresholds of Significance.....	4-562
	4.10.5	Potential Impacts	4-562
	4.10.6	Cumulative Impacts	4-594
	4.10.7	Significant and Unavoidable Impacts.....	4-594
4.11		Hydrology and Water Quality	4-595
	4.11.1	Introduction	4-595
	4.11.2	Environmental Setting: Stanfield/Marsh/Big Bear	4-596
	4.11.3	Environmental Setting: Shay Pond Hydrology	4-600
	4.11.4	Environmental Setting: Bear Valley Groundwater Basin Hydrology	4-603
	4.11.5	Environmental Setting: Big Bear Valley Flood Hazards.....	4-607
	4.11.6	Environmental Setting: Lucerne Valley Hydrology.....	4-607
	4.11.7	Environmental Setting: Lucerne Valley Flood Hazards	4-626
	4.11.8	Regulatory Setting	4-626
	4.11.9	Thresholds of Significance.....	4-638
	4.11.10	Impact Discussion.....	4-638
	4.11.11	Significant and Unavoidable Impacts.....	4-709

4.12	Land Use and Planning.....	4-710
4.12.1	Introduction	4-710
4.12.2	Environmental Setting.....	4-710
4.12.3	Regulatory Setting	4-712
4.12.4	Thresholds of Significance.....	4-717
4.12.5	Potential Impacts	4-717
4.12.6	Cumulative Impacts	4-726
4.12.7	Significant and Unavoidable Impacts.....	4-727
4.13	Mineral Resources	4-728
4.13.1	Introduction	4-728
4.13.2	Environmental Setting.....	4-728
4.13.3	Regulatory Setting	4-729
4.13.4	Thresholds of Significance.....	4-733
4.13.5	Potential Impacts	4-733
4.13.6	Cumulative Impacts	4-739
4.13.7	Significant and Unavoidable Impacts.....	4-739
4.14	Noise.....	4-740
4.14.1	Introduction	4-740
4.14.2	Environmental Setting.....	4-740
4.14.3	Regulatory Setting	4-752
4.14.4	Thresholds of Significance.....	4-757
4.14.5	Potential Impacts	4-757
4.14.6	Unavoidable Adverse Impacts	4-778
4.15	Population and Housing.....	4-779
4.15.1	Introduction	4-779
4.15.2	Environmental Setting.....	4-779
4.15.3	Regulatory Setting	4-783
4.15.4	Thresholds of Significance.....	4-786
4.15.5	Potential Impacts	4-786
4.15.6	Cumulative Impacts	4-792
4.15.7	Unavoidable Adverse Impacts	4-792
4.16	Public Services.....	4-793
4.16.1	Introduction	4-793
4.16.2	Environmental Setting.....	4-793
4.16.3	Regulatory Setting	4-798
4.16.4	Thresholds of Significance.....	4-800
4.16.5	Potential Impacts	4-801
4.16.6	Cumulative Impacts	4-825
4.16.7	Significant and Unavoidable Impacts.....	4-825
4.17	Recreation.....	4-826
4.17.1	Introduction	4-826
4.17.2	Environmental Setting.....	4-826
4.17.3	Regulatory Setting	4-830
4.17.4	Thresholds of Significance.....	4-831
4.17.5	Potential Impacts	4-832
4.17.6	Cumulative Impacts	4-838
4.17.7	Significant and Unavoidable Impacts.....	4-839
4.18	Transportation.....	4-840
4.18.1	Introduction	4-840
4.18.2	Environmental Setting.....	4-840
4.18.3	Regulatory Setting	4-846
4.18.4	Thresholds of Significance.....	4-849
4.18.5	Potential Impacts	4-849
4.18.6	Cumulative Impacts	4-876
4.18.7	Significant and Unavoidable Impacts.....	4-877

4.19	Tribal Cultural Resources.....	4-878
4.19.1	Introduction	4-878
4.19.2	Environmental Setting.....	4-878
4.19.3	Regulatory Setting	4-880
4.19.4	Thresholds of Significance.....	4-882
4.19.5	Potential Impacts	4-882
4.19.6	Cumulative Impacts	4-895
4.19.7	Significant and Unavoidable Impacts.....	4-896
4.20	Utilities and Service Systems.....	4-897
4.20.1	Introduction	4-897
4.20.2	Environmental Setting.....	4-897
4.20.3	Regulatory Setting	4-910
4.20.4	Thresholds of Significance.....	4-925
4.20.5	Potential Impacts	4-926
4.20.6	Cumulative Impacts	4-951
4.20.7	Unavoidable Significant Adverse Impacts.....	4-952
4.21	Wildlife.....	4-953
4.21.1	Introduction	4-953
4.21.2	Environmental Setting.....	4-954
4.21.3	Regulatory Setting	4-955
4.21.4	Thresholds of Significance.....	4-960
4.21.5	Potential Impacts	4-960
4.21.6	Cumulative Impacts	4-982
4.21.7	Unavoidable Adverse Impacts	4-982

Chapter 5 – ALTERNATIVES

5.1	Introduction	5-1
5.1.1	Rationale for Alternative Selection.....	5-1
5.2	Alternatives Considered But Rejected	5-6
5.2.1	Alternative Location	5-6
5.2.2	Imported Water	5-6
5.2.3	Landscape Irrigation	5-7
5.3	No Program Alternative.....	5-7
5.4	Groundwater Recharge at Greenspot Alternative.....	5-17
5.5	Groundwater Recharge at Sand Canyon at Greenspot.....	5-31
5.6	Summary of Alternative.....	5-43
5.7	Conclusion	5-45

Chapter 6 – TOPICAL ISSUES

6.1	Growth Inducing Impacts	6-1
6.2	Cumulative Impacts.....	6-3
6.3	Significant Irreversible and/or Unavoidable Environmental Impacts.....	6-14

Chapter 7 – PREPARATION RESOURCES

7.1	Report Preparation.....	7-1
7.1.1	Lead Agency.....	7-1
7.1.2	EIR Consultant.....	7-1
7.1.3	EIR Technical Consultants.....	7-1
7.2	Bibliography	7-3

Chapter 8 – APPENDICES

- 8.1 Notice of Preparation
- 8.2 NOP Comment Letters, Scoping Meeting Comments, and Responses to
NOP and Scoping Meeting Comments
 - 8.2.1 Scoping Meeting Comments
 - 8.2.2 Responses to NOP and Scoping Meeting Comments
- 8.3 NOP Distribution List

Volume 2 – TECHNICAL APPENDICES (*under separate cover*)

- Appendix 1 – Final Draft Lake Alternative Evaluation
- Appendix 2 – Big Bear Lake Analysis: Replenish Big Bear Final Report
- Appendix 3 – Antidegradation Analysis
- Appendix 4 – Sand Canyon Recharge Evaluation
- Appendix 5 – Report of Waste Discharge for BBARWA Regional Treatment Plant
(Replenish Big Bear)
- Appendix 6 – Groundwater Evaluation at the Lucerne Valley Land Discharge Location
- Appendix 7 – Irrigation Management Plan for the Lucerne Valley Facility
- Appendix 8 – Bear Valley Basin Groundwater Sustainability Plan
- Appendix 9 – TM Response to Comments Regarding Potential Impacts of the Replenish Big Bear
Project on the Lucerne Valley Land Discharge Location
- Appendix 10 – Replenish Big Bear: Modeling of Higher Flows and With Zero TP Load
- Appendix 11 – Air Quality Impact Analysis
- Appendix 12 – Biological Resources and Jurisdictional Waters Assessment
- Appendix 13 – Identification and Evaluation of Historic Properties ([Updated](#))
- Appendix 14 – Energy Analysis
- Appendix 15 – Geology Soils Maps
- Appendix 16 – Greenhouse Gas Analysis
- Appendix 17 – Hazards GeoTracker
- Appendix 18 – TM Water Quality Analysis for the San Canyon Recharge Area
- Appendix 19 – Memo Analysis of Aquatic Life Effects and Water Quality of Replenish Big Bear
Program’s Discharge to Stanfield Marsh and Big Bear Lake

- Appendix 20 – Recycled Water Facilities Study for the Bear Valley Water Sustainability Project
- Appendix 21 – Noise Impact Analysis
- Appendix 22 – California RWQCB Waste Discharge Requirements
- Appendix 23 – Resolution No. 94-63 – Affirming the City of Big Bear Lake’s Right to Reuse Treated Wastewater in Big Bear Valley
- Appendix 24 – Letter re: City of Barstow v. City of Adelanto

CHAPTER 1 – EXECUTIVE SUMMARY

This Executive Summary for the Big Bear Area Regional Wastewater Agency (BBARWA), Big Bear City Community Services District (BBCCSD), City of Big Bear Lake Department of Water and Power (BBLDWP), and Big Bear Municipal Water District (BBMWD), collectively known as the Program Team, Replenish Big Bear Program (Program) Draft Program Environmental Impact Report (DPEIR) summarizes the potential environmental effects that are forecast to occur from implementation of the proposed Program. It also contains a summary of the Program background, Program objectives, and Program description. A table summarizing the potentially significant environmental impacts, mitigation measures (**MMs**), and mitigation responsibility is included at the end of this Executive Summary (**Table 1.5-1**).

BBARWA as the Lead Agency, together with the following agencies—BBCCSD, BBLDWP, and BBMWD henceforth referred to jointly as the Program Team—is proposing to implement the Program, which includes upgrades and additions to BBARWA’s WWTP to produce Program Water through full advanced treatment via a new advanced water purification facility (AWPF).

1.1 PROGRAM BACKGROUND

Natural precipitation provides the sole source of water supply for the Big Bear Valley, and is relied on for potable groundwater supplies, replenishing Big Bear Lake and Stanfield Marsh Wildlife and Waterfowl Preserve (Stanfield Marsh), and supporting the rare and diverse habitat and species in the Big Bear Valley. Drought conditions and a long-term decline in precipitation trends have led the local water management agencies to investigate opportunities for supplemental water supplies, which are extremely limited due to its isolated location at the top of the Santa Ana River watershed (refer to **Figure 3-18**). As such, the Program has been designed to retain local water in the Big Bear Valley to increase the sustainability of water supplies.

Currently, wastewater generated within the Big Bear Valley undergoes preliminary and secondary treatment. Treated undisinfected secondary effluent is discharged to BBARWA’s 480-acre site in Lucerne Valley (LV Site)—about 20 miles north of the Big Bear Valley and outside the Santa Ana Watershed—for irrigation of fodder and fiber crops that are used as feed for livestock. The LV Site referred to herein is the 480-acre portion of the larger 630-acre BBARWA owned site in Lucerne Valley that is regulated by a Colorado River Basin Regional Water Quality Control Board (Colorado Regional Board) Waste Discharge Permit (WDR). The WDR stipulates that 340 acres of the LV Site can be irrigated with recycled water from BBARWA’s Wastewater Treatment Plant (WWTP), with an additional 140 acres available for irrigation utilizing other water sources. Retaining recycled water in the watershed for beneficial use would significantly increase the sustainability of local water supplies. The Program Team has partnered to develop a Program that will retain this water resource in Big Bear Valley for beneficial reuse.

The Program Team intends to implement the Program, which was first discussed in detail in **Appendix 2** “Bear Valley Water Sustainability Project Final Draft Lake Alternative Evaluation” prepared by Water Systems Consulting, Inc. (WSC) dated December 19, 2018. Since 2018, some aspects of the Program have been modified. However, the objectives of the Program remain the same and include the following uses and benefits:

- **Sustain Stanfield Marsh Habitat and Increase Educational Opportunities:** By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained and educational opportunities for the community and visitors would be created;

- **Enhance Big Bear Lake Benefits:** The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- **Expand Local Water Supplies:** When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin. The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge;
- **Sustain Unarmored Threespine Stickleback Fish with Program Water:** To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater. While this part of the Program is included in this DPEIR for analysis purposes, this Program component is not anticipated to be completed in the near term. Therefore, a full analysis was not completed;¹

1.1.1 Program Objectives

The goal of the Program Team is to partner to recover a water resource that is currently being disposed of outside the Big Bear Valley to Lucerne Valley, close the water loop cycle, and keep the water in Big Bear Valley for beneficial reuse. This goal will be achieved through development of a multi-benefit water reuse Program that:

- Augments natural recharge for water supply sustainability;
- Protects the rare and diverse habitat and species in the Big Bear Valley;
- Promotes a thriving community through enhanced recreation;
- Creates a new and sustainable water supply;
- Educates the community about the water cycle, recycled water treatment process, and water quality to gain public support;
- Creates a Program that benefits the Program Team, and thereby benefits the community served by the members of the Program Team;
- Develops a cost-effective project to offset potable water demands; and
- Takes advantage of current outside funding opportunities.

1.1.2 Program Characteristics

The Program Team envisions the facilities described in this Section as a key element in the long-term sustainability of local water supplies for the whole of Big Bear Valley. An overview of the Program components is shown on **Figure 1-1**.

¹ The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (*Gasterosteus aculeatus williamsoni*), which is a Federally and state endangered species.

Replenish Big Bear Program Overview

FIGURE 1-1

The Program Team has prepared this DPEIR for the Program, which evaluates the potential environmental impacts that would result from constructing and implementing the Program. The purpose of an environmental impact report is to provide public agencies and the public in general with detailed information about the effect which a proposed project is likely to have on the environment; to list ways in which the significant effects of such a project might be minimized; and to indicate alternatives to such a project. The focus of the analysis, in accordance with Section 15146 of the California Environmental Quality Act (CEQA) Guidelines, is to address the specific effects of the Program as presented in **Chapter 3, Program Description**. CEQA is intended to inform government decisionmakers and the public about the potential environmental effects of proposed activities and to prevent significant, avoidable environmental damage. However, it is the combination of authorizations and entitlements requested for this Program that must be approved by the Program Team that will enable the Program to be implemented.

While this DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components, project-level detail is provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and, the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdle that would be necessary to modify the water source supporting the Stickleback. Impacts will be quantitatively addressed in project-specific second tier environmental evaluations once specific aspects of the Program are proposed for implementation and designed. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level.

Replenish Big Bear includes permitting, design, and construction of an AWPf at the existing BBARWA WWTP, about 6.59 miles of pipeline for product water and reverse osmosis (RO), brine minimization, three pump stations, a groundwater recharge facility, and up to four monitoring wells. The Program is currently estimated to produce approximately 1,950 acre-feet per year (AFY) of high-quality Program Water, and may produce up to 2,200 AFY by 2040 through utilization of a high-recovery brine minimization technology. Piloting is currently being conducted to confirm the feasibility of the higher yield estimates. For the purposes of this document, 2,200 AFY is used to be conservative in evaluating environmental impacts. The Program components are described below.

BBARWA WWTP Upgrades Project

As part of the Program, upgrades and additions to BBARWA's WWTP including an AWPf to produce purified water (i.e., Program Water) through full advanced treatment will be completed to meet the stringent regulatory requirements for Big Bear Lake, particularly for nutrients (specifically total phosphorus [TP] and total inorganic nitrogen [TIN]) and total dissolved solids [TDS]). The Program will require significant upgrades to the treatment process at the WWTP to meet stringent discharge requirements for the Stanfield Marsh/Big Bear Lake Discharge, Shay Pond Discharge, and the Sand Canyon Recharge. To achieve the anticipated effluent limits, BBARWA will need to implement a series of upgrades to existing unit processes and integrate new unit processes at its WWTP:

- Upgrade the existing oxidation ditches to increase biological nutrient removal process;
- Tertiary filtration and nutrient removal via denitrification filters;
- Ultrafiltration (UF) and reverse osmosis (RO) membrane filtration;

- Brine pellet reactor for brine minimization; and
- Ultraviolet disinfection and an advanced oxidation process (UV/AOP).

A visual representation of the scope of the AWPf upgrades is shown on **Figures 1-2 and 1-3**.

Other improvements at BBARWA's WWTP includes the installation of 2 megawatt (MW) of solar panels at BBARWA's WWTP, Operation and Control Building (OAC), and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building. A visual representation of the BBARWA WWTP Solar Array Project is shown on **Figure 1-4**.

Solar Evaporation Ponds Project

As part of the Program, the Program Team is considering the use of solar evaporation pond(s). Solar evaporation ponds rely on solar energy to evaporate water from the brine concentrate stream, leaving behind precipitated salts, which ultimately are disposed of in a landfill. Pond size requirements can be quite high depending on the brine flow and evaporation rates and the regulatory requirement for impervious liners of clay or synthetic membranes substantially increases the cost of construction. The preliminary RO brine management option for the Program is a brine minimization pellet reactor to reduce the volume of brine waste from the RO process. The reduced brine stream from the pellet reactor will be conveyed to Solar Evaporation Ponds located on BBARWA WWTP property. Using an RO recovery of 90% at 2.2 million gallons per day (MGD) influent flow would result in 0.22 MGD of RO brine to be minimized through the pellet reactor, and approximately 0.022 MGD of brine to be conveyed to the evaporation pond based on a pellet reactor recovery of 90%. A total evaporation pond area of 23 acres is needed for the brine stream. However, if the higher yield cannot be achieved up to a total evaporation pond area of 57 acres would be required. The expected useful life of the evaporation ponds is equal to or greater than the useful life of the AWPf. Additionally, up to two monitoring wells will be required to be installed to verify that seepage from the ponds is not contaminating underlying groundwater. A visual representation of the Solar Evaporation Ponds Project is shown on **Figure 1-5**.

Stanfield Marsh/Big Bear Lake Discharge Project

As part of the Program, up to 2,200 AFY of Program Water is proposed to be discharged to the east end of Stanfield Marsh, which will then flow into Big Bear Lake. Stanfield Marsh and Big Bear Lake are connected through a set of culverts under Stanfield Cutoff. The Stanfield Marsh/Big Bear Lake Discharge Project evaluated several alignment options to convey the purified water from the AWPf to Stanfield Marsh and subsequently Big Bear Lake. The Stanfield Marsh/Big Bear Lake Discharge Project would require installation of up to 12" 19,940 LF, with the length of pipeline being determined based on the Alignment Option BBARWA ultimately selects. Each Alignment Option has been evaluated as part of this DPEIR. The Stanfield Marsh/Big Bear Lake Discharge Project pipeline alignment options are shown on **Figure 1-10**, and listed below for reference:

Alignment Option 1 to Discharge Point 1

- ***Baldwin Lake Pipeline Alignment Option:*** this Alignment Option traverses through Baldwin Lake from the BBARWA WWTP site to connect with the Meadow Lake Pipeline Alignment Option.
- ***Meadow Lane Pipeline Alignment Option:*** this Alignment Option connects with the Baldwin Lake Pipeline Alignment Option, traverses along South Paradise Way south to West Arbor Lane, along West Arbor Lane at South Paradise Way west to Sequoia Drive, along Sequoia Drive at West Arbor Lane south to West Meadow Lake, and along West Meadow Lane west to Discharge Point 1 at Stanfield Marsh.

Scope of Upgrades

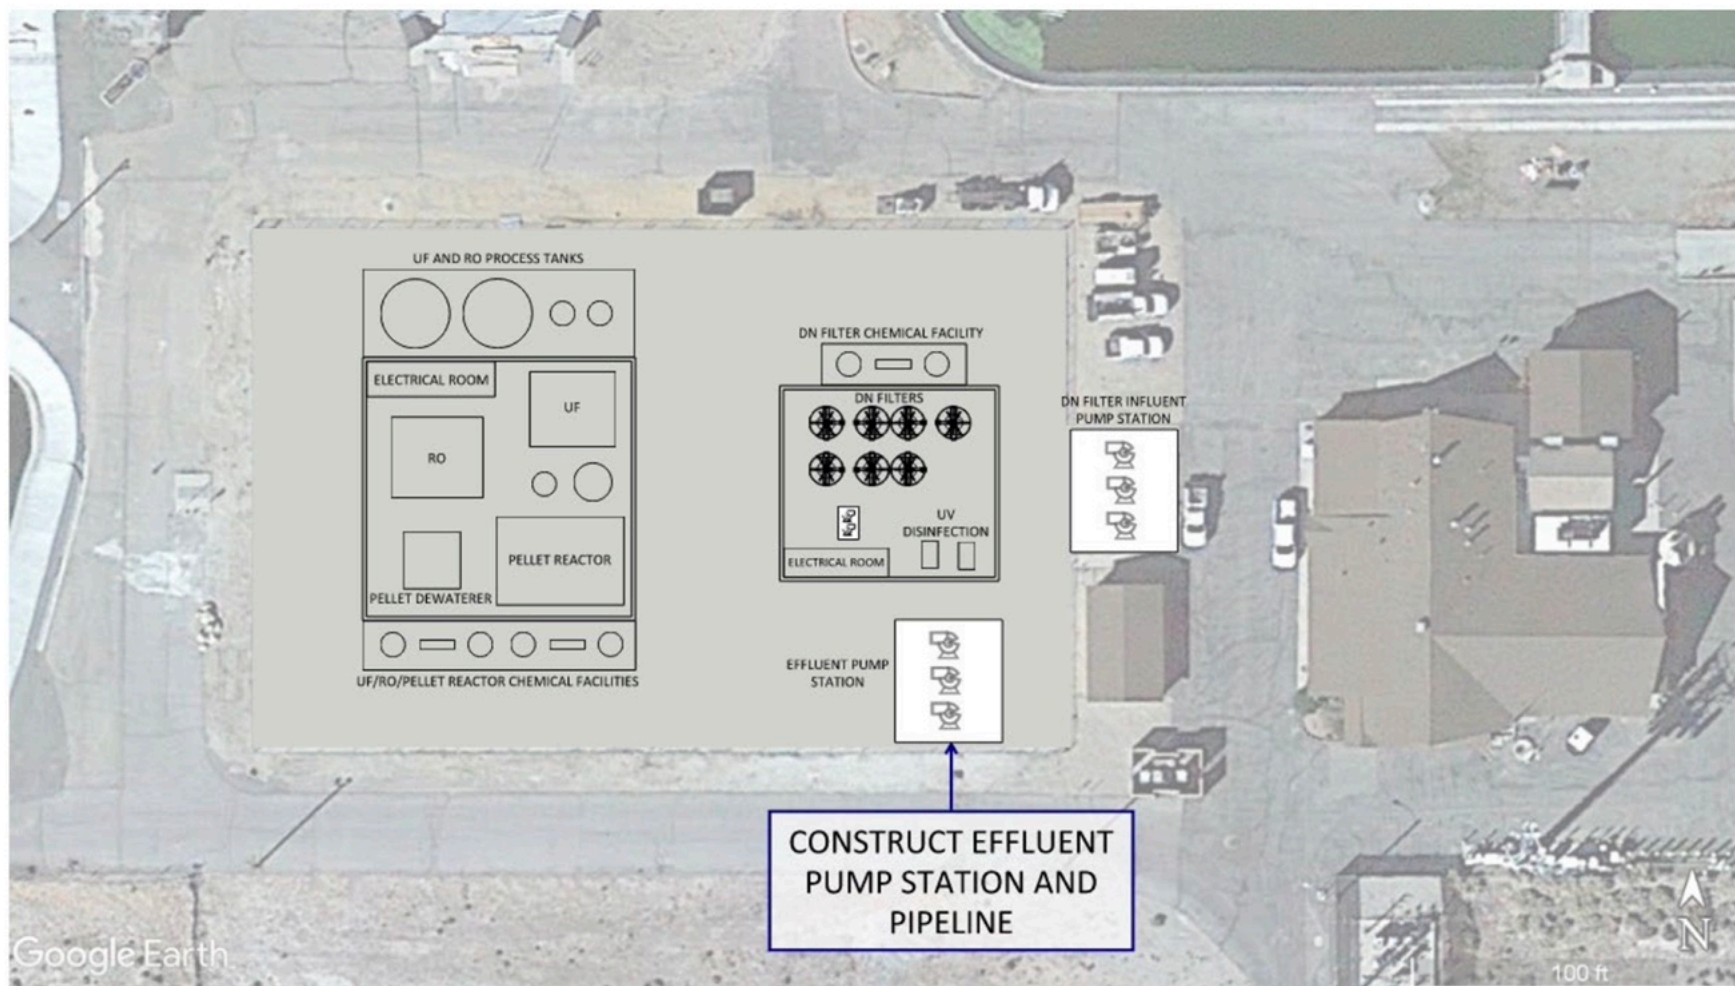

FIGURE 1-2

Scope of Upgrades

FIGURE 1-3

Replenish Big Bear Program

Possible Solar Locations

FIGURE 1-4

Scope of Upgrades

FIGURE 1-5

Alignment Option 2 to Discharge Point 2

- ***East Neighborhoods Pipeline Alignment Option:*** this Alignment Option traverses south from the BBARWA WWTP site south along Palomino Drive to Shay Road, along Shay Road west to Barranca Boulevard, along Barranca Boulevard south/southwest to East Country Club Boulevard, along East Country Club Boulevard west to Bufflehead Drive, along Bufflehead Drive north to East Barker Boulevard, along East Barker Boulevard west to Teal Drive, along Teal Drive north to Mountain View Boulevard, along Mountain View Boulevard west to Shore Drive, along Shore Drive north to Elysian Boulevard, along Elysian Boulevard west to Pintail Drive, along Pintail Drive south to East Mountain View Boulevard, along East Mountain View Boulevard west to Eider Drive, along Eider Drive south to Angeles Boulevard, along and through Angeles Boulevard west to South Paradise Way. At Angeles Boulevard and South Paradise Way, this Alignment Option connects with the West Neighborhoods Pipeline Alignment Option.
- ***West Neighborhoods Pipeline Alignment Option:*** this alignment option traverses east from its connection with the East Neighborhoods Pipeline Alignment Option at Angeles Boulevard and South Paradise, and traverses west along East Angeles Boulevard to Mount Doble Drive, along Mount Doble Drive south to East Country Club Boulevard, along East Country Club Boulevard west to Big Tree Drive, along Big Tree Drive south to Valley Boulevard, along Valley Boulevard west to Bowles Drive, along Bowles Drive southwest to West Aeroplane Boulevard, along West Aeroplane Boulevard northwest and west to Division Drive, along Division Drive north to approximately Fairway Boulevard where the pipeline traverses west to Discharge Point 2 at Stanfield Marsh.

Sand Canyon Recharge Project

As part of the Program, up to 380 AFY of Program Water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period.

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake and discharging it into Sand Canyon, which serves as a flood control channel (refer to **Figure 1-6**). The recharge operation would only occur during summer months when needed to supplement groundwater supply and would be operated intermittently as needed to avoid interference with flood flows. The operation would also be limited by availability of Program Water stored in Big Bear Lake, which would be tracked by BBMWD in accordance with the negotiated accounting framework that will be developed prior to implementation. The Program Team does not have rights to native water in Big Bear Lake and will only use Program Water for recharge.

No channel modifications to the channel bottom are anticipated since it is expected that the Program Water stored in Big Bear Lake will percolate within the defined Sand Canyon Recharge Area. If the Program Water does not fully percolate within the defined recharge area, the surface application discharge rate will be reduced using a variable frequency drive (VFD) on the Sand Canyon Booster Station until the water does percolate within the defined recharge area. Recharge to Sand Canyon would occur through a discharge via a new pipe outlet at the top of the Sand Canyon Recharge Area at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. All of these concepts will need to be coordinated with the San Bernardino County Flood Control District (SBCFCD) to ensure that the capacity of the flood control channel remains sufficient to meet the primary purpose of providing flood protection.

If these improvements resulted in a decrease in surface flow entering Big Bear Lake, the impact to surface water rights under the 1977 Judgment will be evaluated.²

When water is needed for recharge in Sand Canyon, it is assumed that the existing lake pump station owned by the Resorts could be used to transfer water through an existing pipeline into the existing storage pond located at Bear Mountain Ski Resort. Then the Program Water would be conveyed utilizing a new 471 gallon per minute (gpm) booster pump station at the existing storage pond located at the Bear Mountain Ski Resort via a new pipeline from Resort Storage Pond to Sand Canyon 8" 7,210 lineal feet (LF)(refer to **Figures 1-6 and 1-7**). The existing lake pump station and storage pond located at Bear Mountain Ski Resort are used primarily for snowmaking in the winter and are expected to be available for the proposed recharge operation, which would only occur from April through October when the Resorts are not making snow. It is anticipated that a separate WDR permit by BBLDWP will be obtained to regulate the Sand Canyon Recharge Project.

The Program Water will be discharged at the top of the Sand Canyon Recharge Area. The discharge will consist of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. The channel slope will be protected from erosion using rip rap or similar erosion control methods.

Shay Pond Discharge Project

The Shay Pond Discharge Project would replace the potable water source that is currently discharged to the Shay Pond with Program Water as the new water source to maintain the water flow through the Pond. Up to 80 AFY of Program Water may be sent to Shay Pond to support the Stickleback, and any remaining Program Water will be sent to Stanfield Marsh, a tributary of Big Bear Lake. Based on the average volumes of discharges between 2012 and 2022, BBCCSD discharges approximately 50 AFY of potable water into Shay Pond to maintain the endangered Stickleback population. While this part of the Program is included in this DPEIR for analysis purposes, the Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (*Gasterosteus aculeatus williamsoni*), which is a Federally and state endangered species.

There is an existing 6-inch C-900 polyvinyl chloride (PVC) pipeline that begins at the intersection of Shay Road and Palomino Drive and terminates near Shay Pond that can be used to convey the Program Water, with an extension of approximately 710 feet to reach Shay Pond. This nearby pipeline was constructed in 1986 for future use, but has never been put into service. It is possible that this pipeline may not be useable, and as such, a pipeline traversing this same alignment and sized comparably to the existing pipeline may be required, in addition to the proposed 710-foot extension to reach Shay Pond (new Shay Pond Conveyance Pipeline). The length of this pipeline would be 5,600 feet (Shay Pond Replacement Pipeline). A visual representation of the Shay Pond Discharge Project is shown on **Figure 1-9**.

² The Big Bear Dam was originally constructed to provide water storage for Bear Valley Mountain which was formed in 1903 by the citrus growers of the Redlands/Highland area to ensure water supply for irrigation needs. The historic operation of the Big Bear Lake as an irrigation reservoir resulted in drastic fluctuations in lake levels, which conflicted with the goals of BBMWD and the community of Big Bear Valley. A legal conflict over the water rights and management of the lake was ultimately settled out of court through the 1977 Judgement. Under the terms of this judgement, BBMWD purchased the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Bear Valley Mutual. Bear Valley Mutual retained a storage right and ownership of all water inflow into Big Bear Lake.

FIGURE 1-10

LV Site Discharge Reduction

Between 2012 and 2022, the average amount of effluent BBARWA sent to the LV Site is about 2,190 AFY or about 2.0 million gallons per day (MGD). With the implementation of the Program, BBARWA plans to only send water flows in excess of the 2.2 MGD treatment capacity to the LV Site. For redundancy purposes, BBARWA plans to maintain its current discharge location in Lucerne Valley, where undisinfected secondary effluent is currently conveyed to irrigate fodder crops used for livestock feed. However, the discharge to the LV Site would be reduced as a result of implementation of the Program. The reduction in flow to Lucerne Valley would be altered from about 2,190 AFY to about 340 AFY with the implementation of the proposed Program. A visual representation of the LV Site operations is shown on **Figures 3-35 and 3-36**.

1.1.3 Program Facilities

The implementation of the facilities proposed as part of the Program consists of construction and operation of the various facilities summarized below in order to implement the individual projects described under **Subsection 1.1.2, Program Characteristics**, above.

Each Program Category has been formed utilizing the greatest number, intensity, lengths, and capacities for each type of facility proposed under the Program. For example, the pipeline lengths and sizes considered under Program Category 1 represent the option(s) that would require the greatest pipeline length to achieve that “Component” of the Program.

Program Category 1: Conveyance Pipelines

The Program would ultimately install a total of about 6.59 miles or 34,810 LF of various types of pipelines. Potential alignments include the following:

- **Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment:** Pipeline to Big Bear Lake: up to 12” 19,940 LF
 - Alignment Options include:
 - **Alignment Option 1 to Discharge Point 1**
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option
 - **Alignment Option 2 to Discharge Point 2**
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option
- **Shay Pond Conveyance Alignments:**
 - New Shay Pond Conveyance Pipeline: a new 4” 710 LF pipeline would be constructed between the existing BBARWA to Shay Pond pipeline alignment to Shay Pond.
 - Shay Pond Replacement Pipeline: a possible additional 6” 5,600 LF of pipeline to replace the stretch of pipeline between BBARWA’s WWTP site to Shay Pond, which will only be required to implement the Shay Pond Discharge Project if the existing pipeline cannot be utilized.
- **Sand Canyon Recharge Conveyance Pipeline:**
 - Pipeline from the Resort Storage Pond to Sand Canyon: 8” 7,210 LF of pipeline
- **BBARWA WWTP Upgrades Project:**
 - Brine Pipeline (within BBARWA WWTP property): 8” 1,350 LF of pipeline

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

The Program would ultimately install monitoring wells in order to facilitate project operation as follows:

- Up to four (4) monitoring wells

- **Sand Canyon Recharge Project:**
 - Two monitoring wells downstream of the Sand Canyon Recharge Area.
- **Solar Evaporation Ponds Project:**
 - Two monitoring wells near the Solar Evaporation Ponds at the BBARWA WWTP site.

The Program would also install three pump stations in order to facilitate project operation as follows:

- **BBARWA WWTP Upgrades Project:**
 - Effluent Pump Station @ WWTP 1,520 gallons per minute
 - Brine Pump Station @ WWTP: 20 gpm
- **Sand Canyon Recharge Project:**
 - Pump Station @ Resort Storage Pond 471 gpm

The Program would install a pipe outlet at the top of the channel bank at Sand Canyon that discharges down the side slope of the channel into the channel bottom as part of the Sand Canyon Recharge Project. The channel slope will be protected from erosion using rip rap or other erosion control methods, similar to that which is shown on **Exhibit 3-1**.

Program Category 3: Solar Evaporation Ponds Project

The Program would construct between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine.

Program Category 4: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to include 2.2 MGD of full advanced treatment, producing up to 2,200 AFY of Program Water. The AWP includes the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

This Program Category also accounts for the installation of 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building.

1.2 INTENDED USE OF THIS ENVIRONMENTAL IMPACT REPORT

This DPEIR has been prepared in accordance with the CEQA Statutes and Guidelines, 2022, pursuant to Section 21151 of CEQA. BBARWA is the Lead Agency for the Program and has supervised the preparation of this DPEIR. This DPEIR is an information document which will inform public agency decision makers and the general public of the potential environmental effects, including any significant impacts that may be caused by implementing the Program. Possible ways to minimize significant effects of the Program and reasonable alternatives to the Program are also identified in this DPEIR.

This document assesses the impacts, including unavoidable adverse impacts and cumulative impacts, related to the construction and operation of the Program. This DPEIR is also intended to support the permitting process of all agencies from which discretionary approvals must be obtained for particular elements of this Program. There are a wide range of other agencies that may have an interest in or may be involved in the review and approval of the facilities outlined above. The following list is not intended to be exhaustive, but it provides a sense of the agencies that may participate in the review or approval of this Program and specific projects. The potential participating agencies are arranged based on the individual topics contained in the standard CEQA Initial Study Environmental Checklist Form.

Aesthetics: Permits for tree removal may be required from San Bernardino County or the City of Big Bear Lake pursuant to the San Bernardino County Development Code or City of Big Bear Lake Municipal Code, depending on the location of the individual facility. Additionally, the California Department of Forestry and Fire Protection (CAL FIRE) regulates the removal of clusters of trees pursuant to CAL FIRE timberland conversation regulations. The facilities proposed under this Program are anticipated to either require obtaining an exemption or must submit a Timberland Conversion Permit (TCP) pursuant to California Public Resources Code 4621(a) and a Timber Harvesting Plan (THP) pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.

Agriculture &
Forestry

Resources: See the CAL FIRE regulation discussion under Aesthetics, above.

Air Quality: South Coast Air Quality Management District (SCAQMD), permit the operation of the Upgraded BBARWA WWTP and possibly individual pieces of equipment (ex: stand-by emergency generator).

Biology: The U.S. Fish and Wildlife Service (USFWS) and/or California Department of Fish and Wildlife (CDFW) may have to issue incidental take permits. Local jurisdictions issue plant removal permits. The U.S. Army Corps of Engineers (USACE), CDFW and Colorado Regional Board) and Santa Ana Regional Water Quality Control Board (Santa Ana Regional Board) will participate in review of discharge of fill into or alteration of a streambed.

Hydrology &
Water Quality:

A wide range of participation will occur for these issues. A National Pollutant Discharge Elimination System (NPDES) Permit is required to regulate the Stanfield Marsh/Big Bear Lake Discharge, which will be issued by the Santa Ana Regional Board; the Colorado Regional Board will issue a modified WDR to BBARWA; the Santa Ana Regional Board will issue a WDR and Water Recycling Requirements (WRR) for use of recycled water. The California State Water Resources Control Board Division of Drinking Water (DDW) must also review and approve the future use of recycled water. San Bernardino County and local jurisdictions must ensure that stormwater discharges from each of the facility sites meet the current municipal separate stormwater sewer standards (MS4); and Stormwater Pollution Prevention Plan(s) (SWPPP) must be implemented for each location where disturbance exceeds one acre. To construct the facilities a Notice of Intent must be submitted to the State Water Resources Control Board (SWRCB) for a General Construction Permit, which is then enforced by the Colorado Regional Board, only for construction of any facilities located within

Lucerne Valley and the Santa Ana Regional Board for all other facilities proposed as part of the Program within Big Bear Valley; the NPDES Permit Program controls water pollution by regulating point sources that discharge pollutants into waters of the United States (U.S.). Finally, if any flood hazard areas are affected by the proposed Program, SBCFCD, the City of Big Bear Lake, and the Federal Emergency Management Agency (FEMA) may perform reviews for this Program.

Transportation: The proposed Program may require encroachment permits from San Bernardino County, City of Big Bear Lake, and possibly the California Department of Transportation (Caltrans) to construct the pipeline within existing road rights-of-way (ROW).

Other: The proposed Program has been awarded a grant for the Program from the U.S. Bureau of Reclamation (BOR). The proposed Program may seek grants or loan from other Federal agencies, such as the United States Environmental Protection Agency (EPA).

No other reviewing or permitting agencies have been identified.

1.3 PROGRAM APPROVALS

This DPEIR will be used as the information source and CEQA compliance document for the following discretionary actions or approvals by the CEQA Lead Agency, BBARWA. CEQA requires that the BBARWA, the CEQA Lead Agency, consider the environmental information in the Program record, including this DPEIR, prior to making a decision regarding whether or not to approve and implement the Program. The decision that will be considered by BBARWA is whether to approve the Program defined in **Chapter 3** of this document. The Program has several components: BBARWA WWTP upgrades to AWPF; installation of pipeline from the BBARWA WWTP to convey Program Water to Stanfield Marsh, which is hydrologically connected to Big Bear Lake; utilization of an existing pipeline and pump station to distribute Program Water stored in Big Bear Lake to a new pump station near the Resorts; installation of a new pump station to convey Program Water stored in Big Bear Lake to the Sand Canyon Recharge Area from a new pipeline; installation of erosion control using rip rap or similar erosion control methods at Sand Canyon in addition to a new pipe outlet at the Sand Canyon Recharge Area; utilization of an existing or replacement of an existing pipeline to Shay Pond; installation of between 23 and 57 acres of Solar Evaporation Ponds to accommodate 22,000 gallons per day (gpd) to 55,000 gpd of brine concentrate; installation of a 20 gpm pump station to convey brine to the Solar Evaporation Ponds; installation of an additional 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building; and maintenance of the existing discharge to the LV Site for flows in excess of the new treatment train's 2.2 MGD capacity. Alternatively, BBARWA can reject the Program as proposed. This DPEIR evaluates the environmental effects as outlined above.

BBARWA will serve as the CEQA Lead Agency pursuant to the State CEQA Guidelines Section 15051(b)(1). In all future circumstances, BBARWA will remain the Lead Agency for the Replenish Big Bear Program CEQA document. A CEQA Responsible Agency—those defined in Chapter 3, the Program Description of this DPEIR—shall coordinate with BBARWA if and when it assumes CEQA Lead Agency status for a future specific project. The CEQA responsible agencies include the following:

- Partner Agencies: BBCCSD, BBLDWP, and BBMWD
- Other Potential Responsible Agencies: San Bernardino County, City of Big Bear Lake, Santa Ana Regional Board, Colorado Regional Board, CDFW, USFWS, SCAQMD, USACE, DDW, SBCFCD, and Big Bear Airport District (Big Bear Airport)
- Federal Agencies: BOR and EPA

DPEIR has been prepared by Tom Dodson & Associates (TDA) under the direction of the Program Team. TDA was retained to assist the Program Team to perform the independent review of the Program required by CEQA before the DPEIR is released. The Program Team has reviewed the content of the DPEIR and concurs in the conclusions and findings contained herein.

1.4 IMPACTS

The Program Team concluded that an Environmental Impact Report (EIR) should be prepared to address any potential significant impacts that may result from the implementation of the proposed Program. This DPEIR has been prepared for the proposed Program.

Based on data and analysis provided in this DPEIR, it is concluded that the Program could result in potentially significant adverse environmental impacts to the following environmental issues: ***Agriculture and Forestry Resources, Biological Resources, Hydrology and Water Quality, and Utilities and Service Systems***. All other potential impacts were determined to be less than significant without mitigation or can be reduced to a less than significant level with implementation of the **MMs** identified in this DPEIR. Note that the cumulative significant impacts are identified in this DPEIR based on findings that the Program's contributions to such impacts are considered to be cumulatively considerable which is the threshold identified in the State CEQA Guidelines Section 15130. **Table 1.5-1** summarizes all of the environmental impacts and proposed mitigation and monitoring measures identified in this DPEIR and will be provided to the decision-makers and the public prior to finalizing the DPEIR.

The following issues evaluated in the DPEIR have been determined to experience less than significant impacts—either with or without mitigation—based on the facts, analysis and findings in this DPEIR.

Aesthetics: As described in **Subchapter 4.2**, all potential aesthetic impacts associated with the Program can be mitigated to a less than significant impact level. Aesthetic impacts to scenic vistas and resources from disturbance would be potentially significant, but can be reduced to less than significant by shielding facilities and landscaping or revegetating disturbed areas either with landscaping that is consistent with local design guidelines or with native vegetation consistent with that which occurs naturally in the area, as specified in **MMs AES-1 and AES-5, and AES-6**. Program facilities shall be located outside of scenic viewsheds or otherwise undergo subsequent CEQA documentation **MM AES-2**. Additionally, under the Program implementation of **MM AES-3** is required to ensure that the proposed facilities' impacts to scenic resources, such as trees, are minimized to a less than significant level, and **MM AES-4** is required to ensure that future facilities are either not located within sites containing scenic resources or undergo subsequent CEQA documentation to fully analyze the impacts thereof. **MM AES-67** and **AES-78** would minimize light and glare conflicts from future facility construction and operation. As a result, there will not be any unavoidable Program specific or cumulative adverse impacts to aesthetics from implementing the Program as proposed. Impacts would be less than significant through the implementation of mitigation.

Air Quality: As described in **Subchapter 4.4**, with the implementation of mitigation, construction of the proposed Program would reduce impacts for all criteria pollutants below SCAQMD significance thresholds. Additionally, the regional operational emissions that would result from Program implementation would be less than significant without the need for mitigation. Mitigation is required to reduce nitrogen oxide (NO_x) emissions, which would reduce construction related emission to a level of less than significant. Furthermore, the Program would be consistent with the SCAQMD 2022 Air Quality Management Plan (AQMP), and as such would not result in or cause National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) violations. Construction- and operation-source emissions would not exceed the applicable SCAQMD Localized Significance Thresholds (LSTs) and would be less than significant. **MMs** would: reduce NO_x emissions below SCAQMD thresholds, implement a fugitive dust plan at the LV Site, and ensure that the only potential source of new odor generated by the Program—the Solar Evaporation Ponds at BBARWA’s WWTP—would be minimized through an odor complaint and response program. As a result, there will not be any unavoidable Program specific or cumulative adverse impacts to air quality from implementing the Program as proposed. Impacts would be less than significant through the implementation of mitigation.

Cultural Resources: As described in **Subchapter 4.6**, Big Bear Valley is a large area that may contain historical, archaeological, tribal, or paleontological resources. As such, future Program projects may be developed within sites that contain such resources. The site-specific cultural resources report determined that no significant resources were known to occur within the Program Area of potential effects (APE), but that due to the high sensitivity of Big Bear Valley, mitigation is necessary to reduce impacts from Program implementation. **MM CUL-1** would exclude highly disturbed sites from requiring further cultural resource evaluation, in addition to those sites for which a cultural resource evaluation has already been prepared (all Program facilities except the Sand Canyon Monitoring Wells). **MM CUL-2** would require the implementing agency to adhere to adaptive management procedures pertaining to treatment of cultural resources that may be accidentally discovered during earthmoving activities. **MM CUL-3** would ensure that the Sand Canyon Monitoring Wells that are located within undisturbed areas, within a site that will require substantial earthmoving activities and/or excavation, and/or where the implementing agency is seeking State funding, will require a follow-on Phase I Cultural Resources Investigation. This **MM** includes several phases or steps beyond the completion of a Phase I Cultural Resources Investigation that would cover the identification, evaluation, mitigation, and monitoring associated with a given Program where resources may be located. This would ensure that adequate mitigation is provided in the event that significant cultural resources are located within the Sand Canyon Monitoring Wells sites. **MM CUL-4** would ensure that, after each phase of the studies required by **MM CUL-3** has been completed, where required, a complete report on the methods, results, and final conclusions of the research procedures is prepared and submitted to the South Central Coastal Information Center (SCCIC), the Eastern Information Center (EIC), Natural History Museum of Los Angeles County (NHMLAC), and/or San Bernardino County Museum (SBCM). This would ensure that any discoveries are properly documented for future researchers that may seek information regarding the Program Infrastructure project site. **MM CUL-5** would require archaeological monitoring where the Yuhaaviatam of San Manuel Nation (YSMN) deems the Program activity to have a high potential for archaeological sensitivity. The monitor would ensure that any uncovered resources are handled appropriately, and thereby minimizing any potential significant impacts thereof. As described in **Subchapter 4.6**, no unavoidable significant impact to cultural resources will result from implementing the proposed Program. Impacts would be less than significant through the implementation of mitigation.

Energy: As discussed in **Subchapter 4.7**, Program construction and operation would not result in inefficient, wasteful or unnecessary consumption of energy and would not conflict with or

obstruct a state or local plan for renewable energy or energy efficiency. This is because the Program would install a 2 MW solar array that would be capable of generating about 3,652,117 kilowatt hour (kWh) per year, which is more than 95% of the necessary energy to accommodate the proposed Program. California Code of Regulations Title 13, Sections 2449 and 2485, limit idling from both on- road and off-road diesel-powered equipment and are enforced by the California Air Resources Board (CARB). The proposed Program would comply with these regulations. Thus, it is anticipated that construction of the proposed Program would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. The Program would be designed and constructed in accordance with the City of Big Bear Lake and San Bernardino County's latest adopted energy efficiency standards, which are based on the California Title 24 energy efficiency standards. Title 24 standards are widely regarded as the most advanced energy efficiency standards, would help reduce the amount of energy required for lighting, water heating, and heating and air conditioning in buildings and promote energy conservation. Compliance with mandatory measures would ensure that future facilities proposed under the Program would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. As BBARWA would use on-site renewable energy to accommodate more than 95% of the operational energy needs, the Program would not obstruct Federal and State regulations pertaining to energy conservation. Impacts would be less than significant. With compliance with current Federal and State regulations pertaining to energy conservation, the proposed Program is anticipated to have a less than significant impact on energy demand and resources.

Geology and Soils: The Big Bear Valley contains substantial geological and soils constraints. Due to these substantial constraints and the installation of future Program related facilities in locations where such constraints may occur, a potential for significant geology and soils resources impacts from implementation of the Program was identified in **Subchapter 4.8**. However, several **MMs** were identified to minimize geology and soils impacts from implementation of the Program, including those **MMs** that would: reduce potential impacts from geological hazards through a design level geotechnical investigation with implementation of specific design recommendations, relocation of the site, or subsequent CEQA documentation; minimize impacts to paleontological resources through requiring site-specific studies, where necessary. As described in **Subchapter 4.8**, no unavoidable significant impact to geology and soils will result from implementing the proposed Program. Impacts would be less than significant through the implementation of mitigation.

Greenhouse Gas: As described in **Subchapter 4.9**, implementation of the proposed Program will result in approximately 1,499.63 MTCO_{2e}/yr (million metric tons of carbon dioxide per year) from construction and operational activities. As such, the Program would not exceed the SCAQMD's recommended numeric threshold of 3,000 MTCO_{2e} or 10,000 MTCO_{2e}/yr if it were applied. Thus, the Program would not result in a cumulatively considerable impact with respect to greenhouse gas (GHG) emissions. By augmenting local water supplies, the Program would offset energy demands associated with obtaining other sources of water supply in furtherance of this goal of the 2022 Scoping Plan.³ Therefore, the Program would not conflict with the 2022 Scoping Plan,

³ The 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) lays out a path to achieve targets for carbon neutrality and reduce anthropogenic greenhouse gas (GHG) emissions by 85 percent below 1990 levels no later than 2045, as directed by Assembly Bill 1279. The actions and outcomes in the plan will achieve: significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on natural and working lands to reduce emissions and sequester carbon, and the capture and storage of carbon. (CARB, 2023. 2022 Scoping Plan)

and no impact would occur. As concluded in **Subchapter 4.9**, the proposed Program would not have the potential to generate a significant amount of GHGs emissions. As such, the proposed Program will not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Program-related GHG emissions are not considered to be significant or adverse and would not result in an unavoidable significant adverse impact on global climate change. Impacts would be less than significant.

Hazards and Hazardous Materials: The Program contains substantial hazards and hazardous materials issue constraints. Due to these substantial constraints and the installation of future Program infrastructure facilities in locations where such constraints may exist, a potential for significant hazards and hazardous materials issue impacts from implementation of the Program were identified in **Subchapter 4.10**. However, several **MMs** were identified to minimize hazards and hazardous materials impacts, which would apply to both the Program and the Groundwater Recharge at Greenspot Alternative (Greenspot Alternative). Those **MMs** include those that would: ensure that applicable facilities Business Plans incorporate best management practices (BMPs) designed to minimize the potential for accidental release of such chemicals; ensure that applicable facilities Business Plans identify the equipment and response capabilities required to provide immediate containment, control and collection of any released material; ensure sensitive receptors will not be exposed to significant health threat by modeling the pathways of release and implementing specific measures that would minimize potential exposure to acutely hazardous materials; ensure hazardous materials are disposed of and delivered to licensed facilities; ensure the establishment of and adherence to specific thresholds of acceptable clean-up of hazardous materials; ensure the preparation of and adherence to vector management plans; ensure remediation of an accidental spill or discharge of hazardous material in compliance with State and local regulations; ensure that any unknown contamination is remediated and handled according to the local Certified Unified Program Agency (CUPA); ensure that construction traffic is managed safely; and ensure that fire hazard reduction measures are enforced. Therefore, though there will be some adverse impacts as a result of implementing the Program, specific **MMs** have been identified to reduce potential Program specific and cumulative (direct and indirect) impacts to a less than significant level for hazards and hazardous material issues. Thus, the Program is not forecast to cause any unavoidable significant adverse hazards or hazardous material impacts. Impacts would be less than significant through the implementation of mitigation.

Land Use and Planning: As described in **Subchapter 4.12**, impacts related to land use and planning are minimal; however, mitigation is provided to address the potential for conflicts with land use from Program related facilities. This mitigation would ensure that the facilities associated with the Program are developed in appropriate areas, and conform with the surrounding land uses or are developed to minimize conflicts with adjacent land uses. While the potential loss of agricultural operations and agricultural lands at the LV Site that is projected to occur as a result of Program implementation would be significant and unavoidable, given that the continued agricultural operation of the whole of the site (190 acres) would not be sustainable or feasible once the Program is implemented, the proposed Program does not conflict with any General Plan goal and policy. The Program is anticipated to result in a less than significant impact to scenic resources, and furthermore, would preserve and enhance Big Bear Lake and Stanfield Marsh through the provision of additional water, which would result in higher lake levels, enhance recreational opportunities and aquatic habitat, and support water quality improvements, thereby complying the General Plan goals and policies pertaining to preservation of scenic resources. Furthermore, the San Bernardino Countywide Plan and City of Big Bear Lake General Plan

contain several goals and policies pertaining to the provision of adequate water supply, adapting to climate change, and addressing long-range water supply challenges, in fact, the City of Big Bear Lake identifies retaining BBARWA effluent on the mountain for Big Bear Valley use as a policy. As such, the proposed Program would not conflict with goals and policies pertaining to this topic. Therefore, with implementation of this **MM**, the Program-related land use and planning impacts can be reduced below a level of significance, and as such, the proposed Program will not cause unavoidable significant land use and planning impacts. Impacts would be less than significant through the implementation of mitigation.

Mineral Resources: As described in **Subchapter 4.13**, a review of mining operations shown on **Figure 4.13-1**, indicates that there are no existing mining operations within the Program Area (refer to the **Figure 3-29** for a visual depiction of the facilities proposed as part of the Program), and furthermore, there are no active mines shown on San Bernardino County's list of known mining operations in the Big Bear Valley. As such, as no mining operations exist within the Big Bear Valley, and no areas within the Program footprint are designated for mineral extraction, the proposed Program would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. Furthermore, implementation of the Program will not have a significant adverse potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State. Thus, Program-related mineral resource impacts can be reduced below a level of significance, and as such, the proposed Program will not cause unavoidable significant mineral resource impacts. Impacts would be less than significant.

Noise: The Big Bear Valley contains extensive areas with noise sensitive land uses. Due to these substantial noise constraints and the installation of future noise-producing Program facilities in locations where such noise sensitive uses may exist, a potential exists for significant noise impacts from implementation of the Program. However, operational and off-site traffic noise is considered less than significant as described below. Additionally, construction vibration and aircraft noise impacts were determined to be less than significant. The Program will include several improvements at the BBARWA WWTP; however, all new noise sources would be housed inside the new building and the two pumps at the BBARWA WWTP would be housed in concrete masonry unit (CMU) buildings. Similarly, the proposed Sand Canyon pump station would be housed in a CMU building. The proposed structures would achieve between 40 and 50 decibels (dBA) in noise reduction from pump noise to exterior locations. The proposed pumps are anticipated to generate up to 60 dBA at 32 feet. Based on the anticipated reduction, pump noise would be 30 dBA L_{eq} less outside the building. Therefore, operational noise sources would be well controlled and are not anticipated to result in substantial noise level increases.

Furthermore, the limited number of trips would not have the potential to double traffic volumes even on low-volume local roadways. Thus, it is unlikely that individual projects implemented under the Program would increase off-site traffic noise levels by 3 dBA. Therefore, off-site traffic noise impacts would be less than significant, and no mitigation is required.

The highest construction noise levels during the evaporation pond and Sand Canyon monitoring well drilling activities noise levels are expected to exceed the daytime and nighttime noise level limit at the nearest receiver locations within 125 feet and 325 feet, respectively. Since the exact locations of these activities are unknown, and these activities would occur for 24 hours a day for up to two weeks, without mitigation these activities will exceed the applicable noise level limit during the nighttime if located within 325 feet of residences. This would be considered a significant impact. Therefore, mitigation is required for nighttime monitoring well drilling activities at the Sand Canyon Recharge Area. With implementation of the barrier noise levels would be reduced to a

maximum noise level of 69 dBA L_{eq} at 50 feet. None of the potential monitoring well locations would be located within 50 feet of residences. With implementation of these **MMs**, the Program-related noise impacts can be reduced to a less than significant impact level.

Population and Housing: As described in **Subchapter 4.15**, implementation of the Program would not significantly induce growth within the Big Bear Valley. It is anticipated that, while the proposed Sand Canyon Recharge Conveyance Pipeline will be required to traverse through residential property, it will not impact the residential structures themselves. The effort to install the proposed pipeline alignment would not displace any persons or housing. Based on the historic growth pattern in Big Bear Valley communities and future forecast of growth in the 2020 Urban Water Management Plans (UWMP), implementation of the proposed Program is not forecast to cause the less than 1% growth forecast for Big Bear Valley to change in the future. Where the present availability of water does not serve as a constraint to growth, the Program's contribution to planning and expanding water system infrastructure to meet this future demand or changes in climate is considered growth accommodating, not growth inducing. As such and as stated above, the proposed Program is growth accommodating, and it does not in and of itself create opportunities for additional people to move to the region, nor to construct additional housing beyond those previously under consideration to accommodate the population envisioned within the City of Big Bear Lake General Plan and San Bernardino Countywide Plan. Therefore, the implementation of the proposed Program would result in less than significant impacts related to inducement of substantial population growth. As such, the Program-related population and housing impacts are less than significant, and as such, the proposed Program will not cause unavoidable significant population and housing impacts. Impacts would be less than significant.

Public Services: As described in **Subchapter 4.16**, implementation of the Program would not significantly impact fire protection, police protection (in Big Bear Valley, police protection is provided by the San Bernardino County Sheriff), schools, recreation/parks or other public facilities. However, mitigation was identified to minimize impacts to police protection that would minimize the potential for trespass that could exacerbate demand for police protection services. With implementation of this **MM**, the Program-related police protection and park/recreation impacts can be reduced to a less than significant impact level.

Recreation: As described in **Subchapter 4.17**, implementation of the Program would not significantly impact recreation. As discussed under Population and Housing, there would not be a direct increase in population or a substantial number of new jobs that would result in increased demand for parks and recreational facilities within the Big Bear Valley. Additionally, the majority of construction and operations and maintenance staff for any new facilities can be expected to be drawn from the existing population within the Big Bear Valley. The proposed Program may result in enhanced settings at Stanfield Marsh and Big Bear Lake, which is an objective of the Program and thereby may increase recreational opportunities therein. However, recreational infrastructure and fee mechanisms are in place to accommodate any increase in recreation at these locations. Thus, the Program-related recreation impacts would be less than significant, and proposed Program will not cause unavoidable significant recreation impacts.

Transportation: Since transportation system facilities occur throughout much of Big Bear Valley and the installation of future water infrastructure facilities can directly impact roadways or traffic on such roadways, a potential for significant transportation/traffic impacts from implementation of the Program was identified in **Subchapter 4.18**. Mitigation was identified to minimize impacts to transportation that would reduce the Program's potential construction traffic impacts by requiring all construction activities to be conducted in accordance with an approved construction traffic management plan. With implementation of this **MM**, the Program-related transportation impacts

can be reduced below the level of significance, and as such, the proposed Program will not cause unavoidable significant recreation impacts. Impacts would be less than significant through the implementation of mitigation.

Tribal Cultural Resources: As described in **Subchapter 4.19** of this DPEIR, the Yuhaaviatam of San Manuel Nation (YSMN; [formerly known as the San Manuel Band of Mission Indians]) requested continued participation with this Program's CEQA process and future projects implemented under the Program. Concerns expressed include the following: accidental exposure of subsurface cultural resources and proper management of such resources; concerns over exposure of human remains and proper management; presence of Native American monitors during future ground disturbing activities; education of construction workers on tribal history and the potential for resources; and, consultation on the color of the liner for the Solar Evaporation Ponds. Through incorporation of **MMs**, impacts to Tribal Cultural Resources (TCRs) are considered less than significant. Thus, with implementation of mitigation to protect TCRs, the Program would not cause significant unavoidable adverse impacts to TCRs. Impacts would be less than significant through the implementation of mitigation.

Wildfire: The location of Program facilities would likely be located in designated high and very high fire hazard severity zones, and therefore, it is possible that one or more future facilities could be required to locate within such areas. Mitigation was identified to minimize impacts to wildfire that would: reduce the Program's potential traffic conflicts that could be exacerbating in high fire hazard zones by requiring all construction activities to be conducted in accordance with an approved construction traffic control plan; and, ensure fire hazard reduction measures are incorporated into a fire management plan/fuel modification plan for the proposed facilities. Thus, with implementation of mitigation to minimize wildfire impacts, the Program would not cause significant unavoidable adverse impacts under wildfire. Impacts would be less than significant through the implementation of mitigation.

The proposed Program could result in significant impacts to the following environmental issues: Agriculture and Forestry Resources, Biological Resources, Hydrology and Water Quality, and Utilities and Service Systems, based on the facts, analysis and findings in this DPEIR.

Agriculture & Forestry Resources: As described in **Subchapter 4.3**, there are no agricultural resources in the Big Bear Valley, but there are substantial resources at the LV Site that would be impacted, given that the continued agricultural operation of the entire site (190 acres) would not be sustainable or feasible once the Program is implemented. Under the proposed Program, no feasible mitigation is available to account for this loss of Prime Farmland and Farmland of Statewide Importance. The removal of the source of water to support agricultural production at the LV site is an unavoidable consequence of the proposed Program. BBARWA's removal of the undisinfected secondary treated effluent would effectively remove the available water supply enabling the LV Site to remain Prime Farmland and Farmland of Statewide Importance, as an irrigated water source is needed to retain this designation based on the soils underlying the site. BBARWA does not hold any water rights in the Mojave Basin Area (MBA), or more specifically in the Lucerne Valley Groundwater Basin (Lucerne Valley Basin), and therefore, the use of groundwater to continue agricultural production within this site is infeasible. Ultimately, with the implementation of the Program, the 190 acres of Prime Farmland and Farmland of Statewide Importance under agricultural production at the LV Site will be allowed to lie fallow in the future.

In regards to forestry resources, where the Program would have a potential to result in any impacts to forestry as a result of the Sand Canyon Recharge Conveyance Pipeline, mitigation

(**MM AGF-1**) to ensure compliance with CAL FIRE regulations would minimize impacts to a level of less than significant. As described in **Subchapter 4.3**, with the implementation of mitigation, the proposed Program would not result in significant and unavoidable forestry resources impacts. The proposed Program will cause Program specific and cumulative unavoidable significant impacts to agricultural resources.

Biological Resources: As described in **Subchapter 4.5**, there is a potential that a future Program facility may be developed in an area containing significant biological resources that cannot be avoided. Though substantial mitigation is provided to minimize impacts under most circumstances for future Program facilities, no feasible mitigation exists to completely avoid impacts to biological resources within the Big Bear Valley. A potential to adversely impact bird-foot checkerbloom from Program implementation exists. This is because, while it is recommended that the Program Team avoid implementing the Baldwin Lake conveyance pipeline alternative to further avoid impacts to bird-foot checkerbloom, this Baldwin Lake Pipeline Alignment Option is still being considered by BBARWA. **MM BIO-5** would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. Consequently, the Program could cause an unavoidable significant adverse or cumulatively considerable impact on biological resources. However, impacts to all other species and habitats were determined to be less than significant, through the implementation of **MMs BIO-1** through **BIO-28**. Regardless, because of the potential for the Program to adversely impact the bird-foot checkerbloom, the proposed Program is forecast to cause significant unavoidable adverse impacts to biological resources if the Baldwin Lake Pipeline Alignment Option is selected. However, if the Baldwin Lake Pipeline Alignment Option is not selected, the Program would avoid a significant unavoidable adverse impact to biological resources.

Hydrology and Water Quality: The Program will provide ~~a local, drought-resistant water supply with~~ up to 380 AFY ~~of new water used~~ to sustain groundwater levels and storage in the Bear Valley Basin. Furthermore, an analysis of water quality objectives determined that the proposed Program discharge to Big Bear Lake, recharge at Sand Canyon, and discharge to Shay Pond would not conflict with any water quality objectives, and as the proposed Program would also contribute additional groundwater through the Sand Canyon Recharge Area, no significant hydrological impacts are anticipated to occur in the Big Bear Valley from Program implementation. Mitigation has been identified to minimize drainage pattern and flood hazard impacts that may occur under the Program as follows: either surface runoff shall be collected and retained or a grading and drainage plan would be developed during project design and implemented to ensure that pollutants are managed on site and the potential for risk of release thereof due to inundation is minimized, overland flows and drainage at each Program facility site would be assessed and drainage facilities would be designed such that no net increase in runoff would occur; in accordance with the San Bernardino County MS4 Permit, require implementation of BMPs for projects of less than one acre in size that would be comparable to the requirements of the NPDES Construction General Permit (CGP) and SWPPP, which are required for larger projects; ensure that the Sand Canyon Recharge Project operations occur within the defined area on **Figure 3-32**, and that operations would be modified if the recharge was not to fully percolate; require BBLDWP to monitor the discharge and percolation performance in compliance with the terms of the WDR permit for the Sand Canyon Recharge Project operation; and, ensure that monitoring and adaptive mitigation is implemented to protect to beneficial uses of Stanfield Marsh and Big Bear Lake, minimizing impacts thereof. As an identified project within the Bear Valley Basin Groundwater Sustainability Plan (GSP), the Program would not obstruct the implementation of the Bear Valley Basin GSP, and in fact, it would aid in its implementation. Therefore, there is no potential to conflict

with or obstruct the implementation of sustainable groundwater management plan in the Bear Valley Basin.

While the Program would reduce the overall recharge to the Lucerne Valley Basin, this would not conflict with the implementation of sustainable groundwater management plan, as none are applicable to the Lucerne Valley Basin/MBA. The MBA Watermaster, which has the authority to manage the adjudicated MBA, would formulate a response to address the management of the Lucerne Valley Basin as a result of the reduction in recharge to the Lucerne Valley Basin. As this is the MBA Watermaster's responsibility, the Program would not result in a significant potential to conflict with the implementation of a sustainable groundwater management plan. Based on the above discussion, the continued, but reduced, discharge of BBARWA's secondary effluent to the LV Site under the Program will have the potential to contribute to the degradation of water quality in the Lucerne Valley Basin by removing a dilution source, but is not the direct cause of degradation because BBARWA effluent is only a minor contributor and not the primary source of degradation. The Lucerne Valley Basin currently exceeds the MCLs for TDS (recommended) and nitrate, so the reduced flows would not cause the Basin to violate a water quality standard, WDRs or otherwise substantially degrade surface or groundwater quality, but may result in a further exceedance of TDS and Nitrate, which is a potentially significant and unavoidable impact.

The Program has a potential to interfere substantially with groundwater recharge such the Program may impede sustainable groundwater management of the Lucerne Valley Basin as a result of the reduction in discharge to the LV Site. Finally, the Program has a potential to conflict with or obstruct the Colorado Basin Plan for the same reasons the Program has a potential to substantially degrade groundwater quality of the Lucerne Valley Basin discussed above. Thus, the Program would result in cumulatively significant and significant and unavoidable impacts under hydrology and water quality. As such, the Program would result in cumulatively significant and significant and unavoidable impacts under hydrology and water quality as a result of the reduction in discharge to the LV Site. No feasible **MMs** exist to avoid these significant and unavoidable impacts.

Utilities and Service Systems: **Subchapter 4.20** concluded that implementation of the Program would not significantly impact stormwater drainage, energy, natural gas telecommunications, or solid waste. Additionally, mitigation is required to minimize impacts related to stormwater through implementation of a drainage plan to reduce downstream flows for future Program projects. Mitigation is required to address potential impacts related to solid waste including those that would: ensure that construction and demolition materials that are salvageable are recycled, and thereby diverted from the local landfill, which will minimize the potential for Program projects to generate waste in excess of local landfill capacities; and ensure that soils that would generally be exported from a given construction site are salvaged where possible for recycling and ultimately reuse, thereby diverting this waste stream from the local landfill. The construction of infrastructure related to energy and natural gas was analyzed and determined to be less than significant with the implementation of mitigation. This mitigation would ensure that Program projects not located in an area containing adjacent access to electricity and natural gas infrastructure would require subsequent CEQA documentation. With implementation of this mitigation the proposed Program will not cause unavoidable significant adverse impacts to energy or natural gas. The construction of infrastructure related to telecommunications was determined to be less than significant with the implementation of mitigation. This mitigation would ensure that Program projects not located in an area containing adjacent access to telecommunication infrastructure would require subsequent CEQA documentation. With implementation of this mitigation the proposed Program will not cause unavoidable significant adverse impacts to telecommunications.

Based on the facts and findings presented in the DPEIR analysis, the proposed Program will not cause unavoidable significant adverse impacts to stormwater drainage, energy, natural gas, telecommunications, or solid waste.

The topic of water and wastewater infrastructure were also discussed in **Subchapter 4.20**. As determined in the preceding evaluation, the proposed Program would result in significant and unavoidable impacts under utilities and service systems, which pertains both to the Big Bear Valley and to the reduction in discharge of undisinfected secondary effluent to the LV Site. As described in **Subchapter 4.5, Biological Resources**, the construction of the proposed water and wastewater facilities associated with the Program is anticipated to cause a significant biological resources impact if the Baldwin Lake Pipeline Alignment Option is the selected Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option. This is because construction of the Baldwin Lake Pipeline Alignment Option may affect bird-foot checkerbloom, as it is present within the proposed Program Area footprint for this pipeline alignment. While **MMs BIO-1** through **BIO-4** would minimize impacts to bird-foot checkerbloom from construction of the Solar Evaporation Ponds to a level of less than significant, **MM BIO-5** would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. If BBARWA does not select the Baldwin Lake Pipeline Alignment Option, a significant impact under this issue would be avoided. Regardless, as the Baldwin Lake Pipeline Alignment Option may be the selected Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option, impacts under this issue are considered significant and unavoidable. Therefore, the construction of the proposed water and wastewater facilities associated with the Program is anticipated to cause a significant biological resources impact.

As described under hydrology and water quality, the action towards addressing groundwater supply challenges, given Big Bear Valley's remote location, that would be addressed by the Program would help provide sufficient supply in the Big Bear Valley.

The proposed Program would result in significant and unavoidable impacts on utilities and service systems because of the reduction in discharge of disinfected secondary effluent to the LV Site. No mitigation is available to reduce the potential for a significant and unavoidable impact to occur to water supplies in the Lucerne Valley Basin as a result of Program Implementation. This is because the Program would reduce the amount of water that would be discharged to the Lucerne Valley Basin, which has a potential to impact the amount of water that could be expected to be recharged to the Lucerne Valley Basin on an annual basis, thereby impacting water supplies. Therefore, the proposed Program would also have a significant and unavoidable potential for the implementation of the Program to substantially impair the availability of water supplies in the Lucerne Valley Basin as a result in the reduction in recharge to the Lucerne Valley Basin.

1.5 EXECUTIVE SUMMARY IMPACTS TABLE

The Executive Summary of potential Program impacts is presented in **Table 1.5-1**.

Table 1.5-1 provides a summary of all impacts and **MMs** identified in the detailed environmental evaluation presented in Chapter 4 of this DPEIR. This summary is meant to provide a quick reference to proposed Program impacts, but the reader is referenced to Chapter 4 to understand the assumptions, method of impact analysis and rationale for the findings and conclusions presented in **Table 1.6-1**.

**Table 1.5-1
 SUMMARY OF IMPACTS AND AVOIDANCE, MINIMIZATION AND MITIGATION MEASURES
 DISCUSSED IN THIS DPEIR**

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>AESTHETICS</p> <p>AES-1 Proposed facilities shall be designed in accordance with local design standards and integrated with local surroundings. Landscaping shall be installed in conformance with local landscaping design guidelines as appropriate to screen views of new facilities and to integrate facilities with surrounding areas.</p>	Implementing Agency ⁴
<p>AES-2 Future Replenish Big Bear Program facilities at unknown locations shall either (1) be located outside of scenic viewsheds identified in the General Plan or Municipal Code corresponding to a proposed location for a future facility; (2) be unobtrusive to scenic vistas due to height or blending the facility into the natural environment confirmed by a visual simulation that demonstrates this; or (3) where (1) or (2) are not possible, undergo subsequent CEQA documentation to assess potential aesthetic impacts a future Replenish Big Bear Program facility may have upon contain scenic resources.</p>	Implementing Agency
<p>AES-3 Should the removal of trees be required for a specific Program Component, the implementing agency shall comply with the applicable local jurisdiction's municipal code or development code pertaining to the removal of trees. For Program Components within the City of Big Bear Lake, the implementing agency shall comply with the City's Municipal Code Chapter 17.10, Tree Conservation and Defensible Spaces, where applicable. For Program Components within San Bernardino County, the implementing agency shall comply with the San Bernardino County Development Code Plant Protection and Management (88.01), where applicable.</p>	Implementing Agency
<p>AES-4 Future proposed facilities defined within the Replenish Big Bear Program at unknown locations shall either (1) be located within sites that avoid rock outcroppings and other scenic resources as defined in State CEQA Guidelines Appendix G, or (2) undergo subsequent CEQA documentation to assess potential impacts from locating a future facility in an area that may contain scenic resources.</p>	Implementing Agency
<p>AES-5 When Replenish Big Bear Program above ground facilities are constructed in the future, the local agency design guidelines for the project site shall be followed to the extent that they do not conflict with the engineering and budget constraints established for the facility and except where such compliance is not required by California law.</p>	Implementing Agency
<p>AES-6 — When Replenish Big Bear Program above ground facilities are constructed in the future, the local agency design guidelines for the project site shall be followed to the extent that they do not conflict with the engineering and budget constraints established for the facility and except where such compliance is not required by California law.</p>	Implementing Agency
<p>AES-67: Future Replenish Big Bear Program projects shall implement at least the following measures, unless they conflict with the local jurisdiction's light requirements, in which case the local jurisdiction's requirements shall be enforced:</p> <ul style="list-style-type: none"> • Use of low-pressure sodium lights where security needs require such lighting to minimize impacts of glare. • The height of lighting fixtures shall be lowered to the lowest level consistent with the purpose of the lighting to reduce unwanted illumination. • Directing light and shielding shall be used to minimize off-site illumination during both construction or operation of any Program facility. • No light shall be allowed to intrude into sensitive light receptor areas during both construction or operation of any Program facility. • Non-reflective materials and/or coatings shall be used on the exterior of all facilities if constructed in a publicly visible location (such as from a roadway or public facility). 	Implementing Agency
<p>AES-78: A facility lighting plan that shall apply to construction and operation shall be prepared for each Replenish Big Bear Program component and shall demonstrate that glare from construction, operation and safety night lights that may create light and glare affecting adjacent occupied property are sufficiently shielded to prevent light and glare from spilling into occupied structures. This plan shall specifically verify that the lighting doesn't exceed 1.0 lumen at the nearest residence to any lighting site within the project footprint. This plan shall be implemented by the implementing agency to minimize light or glare intrusion onto adjacent properties.</p>	Implementing Agency

⁴ Implementing Agency refers to the Agency of the Program Team—BBARWA, BBCCSD, BBLDWP, and BBMWD—implementing the individual facility for which these mitigation measures apply.

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p><u>During Program construction and operation, the Implementing Agency shall eliminate all nonessential lighting throughout each individual Program area and avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active. BBARWA shall ensure that lighting for Program activities is shielded, cast downward, and does not spill over onto other properties or upward into the night sky, except where essential to perform Program operations (see the International Dark-Sky Association standards at http://darksky.org/). BBARWA shall ensure use of LED lighting with a correlated color temperature of 3,000 Kelvins or less.</u></p>	

Impact Description	Impact After Mitigation
<p>AESTHETICS</p> <p>The existing visual setting of the proposed program area will be permanently altered. The intensification of development greater than that which presently occurs within the Big Bear Valley will change the visual setting. The impacts to visual resources in the area including scenic resources, trees, rock outcroppings, etc., and from new sources of light and glare were determined to be significant without mitigation. As such, mitigation is required to reduce impacts under this issue.</p>	<p>As described in Subchapter 4.2, aesthetic impacts to scenic vistas and resources from disturbance would be potentially significant, but can be reduced to less than significant by shielding facilities and landscaping or revegetating disturbed areas either with landscaping that is consistent with local design guidelines or with native vegetation consistent with that which occurs naturally in the area, as specified in MMs AES-1 and AES-5, and AES-6. Program facilities shall be located outside of scenic viewsheds or otherwise undergo subsequent CEQA documentation MM AES-2. Additionally, under the Program implementation of MM AES-3 is required to ensure that the proposed facilities' impacts to scenic resources, such as trees, are minimized to a less than significant level, and MM AES4 is required to ensure that future facilities are either not located within sites containing scenic resources or undergo subsequent CEQA documentation to fully analyze the impacts thereof. MM AES-67 and AES-78 would minimize light and glare conflicts from future facility construction and operation. As a result, there will not be any unavoidable Program specific or cumulative adverse impacts to aesthetics from implementing the Program as proposed.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>AGRICULTURE AND FORESTRY RESOURCES</p> <p>AGF-1: Should the removal of clusters of trees subject to CAL FIRE timberland conversation regulations be required for a specific Program Component, the implementing agency shall comply with CAL FIRE regulations, specifically, prior to the removal of any trees subject to CAL FIRE regulations for a given Program Component, the implementing agency shall obtain an exemption, a "Public Agency, Public and Private Utility Right of Way Exemption" (1104.1(b)(c)) or a "Less Than 3 Acre Conversion Exemption" (1104.1(a)). Should an exemption for the removal of trees subject to CAL FIRE timberland conversation regulations be unavailable due to the limitations set forth by CAL FIRE of one exemption per agency per five years, the implementing agency shall prepare and submit a TCP pursuant to California Public Resources Code 4621(a) and a THP pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.</p>	<p>Implementing Agency</p>

Impact Description	Impact After Mitigation
<p>AGRICULTURE AND FORESTRY RESOURCES</p> <p>As described in Subchapter 4.3, there are no agricultural resources in the Big Bear Valley, but there are substantial agricultural resources at the LV Site. As such, implementation of the proposed Program was determined to have a potentially significant impact to land at the LV Site designated as Prime Farmland, Unique Farmland, and/or Farmland of Statewide Importance. Therefore, impacts at the LV Site would be potentially significant requiring mitigation to minimize impacts to a level of less than significant. Furthermore, the Program would have a potential to result in any impacts to forestry as a result of the Sand Canyon Recharge Conveyance Pipeline if removal of clusters of trees subject to CAL FIRE timberland conversation regulations are completed.</p>	<p>As described in Subchapter 4.3, under the proposed Program, no feasible mitigation is available to account for the loss of Prime Farmland and Farmland of Statewide Importance at the LV Site. The removal of the source of water to support agricultural production at the BBARWA site is an unavoidable consequence of the proposed Program. BBARWA's removal of the undisinfectated secondary treated effluent would effectively remove the available water supply enabling the LV Site to remain Prime Farmland and Farmland of Statewide Importance, as an irrigated water source is needed to retain this designated based on the soils underlying the site. BBARWA does not hold any water rights in the MBA, or more specifically in the Lucerne Valley Basin, and therefore, the use of groundwater to continue agricultural production within this site is infeasible.</p>

Impact Description	Impact After Mitigation
	Ultimately, with implementation of the Program, the 190 acres of Prime Farmland and Farmland of Statewide Importance under agricultural production at the LV Site will be allowed to lie fallow in the future. Where the Program would have a potential to result in any impacts to forestry as a result of the Sand Canyon Recharge Conveyance Pipeline, mitigation to ensure compliance with CAL FIRE regulations would minimize impacts to a level of less than significant. As described in Subchapter 4.3 , with the implementation of mitigation, the proposed Program would not result in significant and unavoidable forestry resources impacts. The proposed Program will cause Program specific and cumulative unavoidable significant impacts to agricultural resources.

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
AIR QUALITY AQ-1 When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the EPA/CARB Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications.	Implementing Agency
AQ-2: BBARWA shall implement a fugitive dust response plan at the LV Site. This plan shall begin with signage at the LV Site (one along Camp Rock Road and one along Old Woman Springs Road [Highway 247]) notifying the public of a phone number and email address that can be reached if fugitive dust is observed migrating from the site. This same notification and information shall retain a place on BBARWA's website. In response to any notifications from the public that fugitive dust is observed migrating from the LV Site, BBARWA shall implement a plan of response to minimize fugitive dust. This plan can range from short-term in nature (i.e. utilization of chemical stabilization or water to spray on the surfaces from which dust originates at the LV Site) to long-term in nature (i.e. utilization of gravel or like natural materials to stabilized the LV Site surface over the long-term or planting native plants or cover crop to stabilize the soils). The end result of implementation of the fugitive dust response plan shall be to diminish visible dust at the LV Site.	Implementing Agency
AQ-3: BBARWA will establish an odor complaint/response program and will respond to any odor complaints received for this Program by odor levels at the affected receptor following the methodology specified in the American Society for Testing and Materials (ASTM) Recommended Practice E679-04. If the odor levels exceed the odor intensity value of 3.0 or greater on the 8-point n-butanol intensity scale, an odor response plan will be developed and initiated to minimize the potential for odor complaints as a result of the solar brine evaporation pond operations. Odor response shall include, but not be limited to, more frequent precipitated crystal removal from the solar brine evaporation pond shall, and application of odor neutralizing materials. This odor response/complaint program shall begin once the Solar Evaporation Ponds are operational for at least one year thereafter. If no complaints are received within the first year of operations, the program shall conclude. If one or more complaints are received within the first year of operations, the program shall continue on for the duration of Program operations.	Implementing Agency

Impact Description	Impact After Mitigation
AIR QUALITY The Program-specific evaluation of emissions presented in Subchapter 4.3 demonstrates that construction of the proposed Program would result in an exceedance of thresholds for a criteria pollutant: NO _x . Maximum daily NO _x emissions would exceed the SCAQMD regional significance threshold throughout the entire duration of Program construction. Operational emissions were modeled to be below significance thresholds without the need for added mitigation. However, a Notice of Preparation (NOP) commenter raised a concern about fugitive dust migrating from the LV Site as a result of a portion of the	As described in Subchapter 4.4 , with the implementation of mitigation, construction of the proposed Program would reduce impacts for all criteria pollutants below SCAQMD significance thresholds. Mitigation would be required to reduce NO _x emissions, which would reduce construction related emission to a level of less than significant. MMS would: reduce NO _x emissions below SCAQMD thresholds, implement a fugitive dust plan at the LV Site, and ensure that the only potential source of new odor generated by the Program—the solar brine evaporation ponds at BBARWA's WWTP—would be minimized through an odor complaint and response program. As a result, there will not be any

Impact Description	Impact After Mitigation
<p>fields being allowed to go fallow, and without mitigation, fugitive dust impacts could be significant. Additionally, an NOP commenter raised a concern that the Solar Evaporation Ponds may emit a noticeable odor, and while it is not anticipated that odor will be observed by any receptors nearby attributable to the Solar Evaporation Ponds, without an odor response program, a significant impact could occur.</p> <p>The Program would be consistent with the SCAQMD 2022 AQMP, and as such would not result in or cause NAAQS and CAAQS violations. Construction- and operation-source emissions would not exceed the applicable SCAQMD Localized Significance Thresholds and would be less than significant. Mitigation is required to reduce the Program's contribution to significant air quality emissions.</p>	<p>unavoidable Program specific or cumulative adverse impacts to air quality from implementing the Program as proposed.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>BIOLOGICAL RESOURCES</p> <p>BIO-1 The Solar Evaporation Ponds shall be designed to avoid areas where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Orange construction fencing, or similarly visible material should be installed around the area where bird-foot checkerbloom is located, and this area should be completely avoided.</p>	<p>Implementing Agency</p>
<p>BIO-2 Preconstruction clearance surveys shall be conducted by a qualified biologist who is familiar with the local flora, to determine if any special status plant species are present within the proposed disturbance area prior to construction of any individual Program component. Botanical surveys shall be conducted during the appropriate time of year, when target species are both evident and identifiable.</p> <p><u>Should any special status plants be located within the area of potential effect (APE) during the preconstruction survey (excluding the Baldwin Lake Pipeline Option), the Implementing Agency shall fully avoid the plant(s) in accordance with the provisions of MM BIO-3 or due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, if the species is federally listed, or an Incidental Take Permit (ITP) from CDFW shall be obtained. Subject to CDFW and/or USFWS concurrence, the Implementing Agency shall mitigate the loss of the plant(s) through the purchase of mitigation credits from a CDFW-approved bank, or the acquisition and conservation of land approved by CDFW at a minimum 1:1 (replacement-to-impact) ratio.</u></p>	<p>Implementing Agency</p>
<p>BIO-3 If any listed bird-foot checkerbloom is found by the onsite biological monitor, or by construction personnel who are educated in species avoidance pursuant to MM BIO-16, within the proposed disturbance area(s), then orange construction fencing, or similarly visible material should be installed around the area where they are located, and this area shall be completely avoided. This measure applies to the Solar Evaporation Ponds Project as shown on Figure 4.5-10. This measure does not apply to the Baldwin Lake Pipeline Alignment Option, should this alignment be the selected Alignment Option. If the Baldwin Lake Pipeline Alignment Option is selected, the bird-foot checkerbloom plants shall be handled pursuant to MM BIO-5.</p>	<p>Implementing Agency</p>
<p>BIO-4 If any other listed special status species are found within the proposed disturbance area(s), then orange construction fencing, or similarly visible material should be installed around the area where they are located, and this area shall be completely avoided. This measure does not apply to the Baldwin Lake Pipeline Alignment Option, should this alignment be the selected alternative. If the Baldwin Lake Pipeline Alignment Option is selected, the bird-foot checkerbloom plants shall be handled pursuant to MM BIO-5.</p>	<p>Implementing Agency</p>
<p>BIO-5 Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:</p> <ul style="list-style-type: none"> At least 20 days prior to construction within areas containing the bird-foot checkerbloom, or sooner, BBARWA shall notify USFWS and CDFW of the construction plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction. Due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, and an Incidental Take Permit (ITP) from CDFW shall be obtained. 	<p>Implementing Agency</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<ul style="list-style-type: none"> • <u>If neither CDFW nor USFWS opt to collect plants and/or plant seeds Subject to CDFW and USFWS concurrence, with the ultimate mitigation strategy to be approved by CDFW and USFWS prior to implementation, BBARWA shall proceed with the following approach to mitigate impacts to this species:</u> <ul style="list-style-type: none"> ○ <u>BBARWA shall transplant the plants implement a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either:</u> <ul style="list-style-type: none"> ▪ <u>(a) replanted over the to a location where the plants can be conserved and protected outside of the Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or.</u> ▪ <u>(b) replanted in BBARWA's established conservation area to protect the species in perpetuity.</u> 	
<p>BIO-6 In order to change the water source at Shay Pond, an adaptive management and mitigation plan (AMMP) shall be developed by BBARWA. The implementing agency—BBARWA, in association with BBCCSD—shall coordinate with USFWS and CDFW to obtain verbal agreement on the approach to forecast impacts to the Stickleback. Then, the implementing agency or biologist familiar with the Stickleback contracted to the implementing agency shall draft a memorandum of understanding (MOU) (that would be between BBARWA and/or BBCCSD and USFWS and/or CDFW) to lay a solid framework for the development of an AMMP. The MOU will determine if additional permitting will be required from both the State and Federal government for the take of an endangered species.</p> <p>The AMMP shall identify a sampling and monitoring program for the lifespan of the Program. This will include any triggers or adaptive management strategies that could be implemented to improve conditions for the Stickleback, including alterations to water temperature, inclusion of bubblers to increase dissolved oxygen or other techniques to be identified. The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.</p> <p><u>As part of the MOU and AMMP implementation process, BBARWA, in association with BBCCSD shall obtain the following data to be provided to CDFW and/or USFWS:</u></p> <ul style="list-style-type: none"> • <u>Data on the chemical characteristics of the Program Water to be used for the Project;</u> • <u>Data on the physical characteristics of the Program Water that are likely to impact fish species, such as water temperature, dissolved oxygen, and pH;</u> • <u>A comparison of water quality for the Program Water versus the groundwater currently being used to discharge to Shay Pond to ascertain if the change in water source would introduce contaminants that may impact the reproduction and survival of the stickleback.</u> 	Implementing Agency
<p>BIO-7 Prior to implementation of the <u>Sand Canyon Monitoring Wells (once the final locations have been selected), and prior to the</u> replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8), a site-specific biological resources assessment shall be conducted by a qualified biologist familiar with Big Bear Valley flora and fauna. This survey shall be conducted in accordance with appropriate standards by a qualified biologist/ ecologist. If sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the California Natural Diversity Database (CNDDB) will be notified and the following subsequent mitigation actions will be taken:</p> <ol style="list-style-type: none"> a. <u>BBARWA The Implementing Agency</u> shall provide compensation for sensitive habitat acreage lost by acquiring and protecting in perpetuity (through property or mitigation bank credit acquisition) habitat for the sensitive species at a ratio of not less than 1:1 for habitat lost, <u>with the ultimate compensatory mitigation ratio being determined through negotiation with USFWS and/or CDFW, and never less than 1:1.</u> The property acquisition shall include the presence of at least one animal or plant per animal or plant lost at the development site to compensate for the loss of individual sensitive species. b. The final mitigation may differ from the above values based on negotiations between the project proponent and USFWS and CDFW for any incidental take permits for listed species. BBARWA and/or the implementing agency shall retain a copy of the incidental take permit as verification that the mitigation of significant 	Implementing Agency

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>biological resource impacts at a project site with sensitive biological resources has been accomplished.</p> <p>c. Preconstruction botanical surveys for special-status plant communities and special-status plant species will be conducted in areas that were not previously surveyed because of access or timing issues or project design changes; pre-construction surveys for special-status plant communities and special-status plant species will be conducted before the start of ground-disturbing activities during the appropriate blooming period(s) for the species. If special-status plants or plant communities are identified, the following hierarchy of actions shall be taken: a) find an alternative site; b) avoid the plants and maintain them onsite after completing the project; or c) provide compensatory mitigation offsite.</p>	
<p>BIO-8 Appropriate BMPs (e.g., silt fence) should be implemented during construction of the Shay Pond Conveyance Pipeline to ensure that no sediment or pollutants enter Shay Pond/Shay Creek, such that construction does not impact the Stickleback and/or its habitat.</p>	Implementing Agency
<p>BIO-9 All construction activities associated with the proposed Solar Evaporation Ponds shall be conducted when the portion of Baldwin Lake where this Program component will occur is dry.</p>	Implementing Agency
<p>BIO-10</p> <ol style="list-style-type: none"> 1. Preconstruction rubber boa surveys are recommended for each Program component that would provide 100% visual coverage of any undeveloped areas within the proposed Program Area footprint and would consist of a systematic ground search that would focus on moveable surface materials such as rocks, logs, duff, and man-made debris that may provide shelter for rubber boa. 2. Rubber boa exclusion fence (e.g., silt fence) shall be installed around the perimeter of the Sand Canyon Recharge Pipe Outlet construction site prior to commencement of any Program related ground disturbing activities in this area. All construction activities shall be restricted to within the fenced disturbance limits to avoid potential harm to rubber boa that may be present in nearby habitat. 3. A qualified biologist who is familiar with southern rubber boa and its habits shall be present on site during initial ground disturbing activities within or adjacent any potential rubber boa habitat to monitor the clearing/removal of any surface objects that could potentially provide rubber boa refugia or hibernacula (e.g., rotting logs/stumps, duff layer). The biological monitor shall visually inspect under any surface cover objects prior to their removal to ensure no rubber boa are harmed or killed. 4. All open trenches shall be backfilled or covered at the end of the day and ramped to allow rubber boa and other wildlife to escape. 5. If a rubber boa is found during preconstruction presence/absence surveys or during construction activities, all site-specific project activities shall be halted, CDFW shall be contacted, and a California Endangered Species Act (CESA) Incidental Take Permit shall be obtained from CDFW prior to reinitiating project activities. 	Implementing Agency
<p>BIO- 11</p> <ol style="list-style-type: none"> 1. To ensure the Program does not impact flying squirrel, preconstruction surveys for each Program Component (except those occurring at the BBARWA WWTP) shall be conducted to identify potentially suitable cavity nesting sites and foraging habitat, prior to the removal of any trees or downed woody debris. 2. If suitable flying squirrel cavity nesting sites are detected within the proposed Program Area footprint, then coordination with the CDFW would be necessary to determine appropriate minimization and MMs to offset Program related impacts to this species prior to the commencement of construction within the area within which the suitable flying squirrel cavity nesting sites are located. 	Implementing Agency
<p>BIO-12 To avoid potential impacts to nocturnal species such as the California Spotted Owl (SPOW) and flying squirrel, due to light pollution, project related night lighting (both temporary and permanent) shall be directed away from adjacent areas to protect nocturnal species from direct night lighting. Shielding shall be incorporated in project designs to ensure ambient lighting in adjacent areas is not increased.</p>	Implementing Agency
<p>BIO-13 During final design and prior to issuance of construction permits each specific infrastructure improvement project, a BRMP shall be prepared to:</p> <ul style="list-style-type: none"> • Assemble the biological resources MMs to be applied for each specific infrastructure improvement in the future; • Specify the terms and conditions from applicable permits and agreements and make provisions for monitoring assignments, scheduling, and responsibility; • Discuss habitat replacement and revegetation, protection during ground-disturbing activities, performance (growth) standards, maintenance criteria, and monitoring requirements for temporary and permanent native plant community impacts; and 	Implementing Agency

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<ul style="list-style-type: none"> The parameters of the BRMP will be formed with the MMs from subsequent CEQA documentation (if required), including terms and conditions as applicable from the USFWS, USACE, SWRCB/Regional Water Quality Control Board (RWQCB), and CDFW. 	
<p>BIO-14 <u>Prior to the commencement of construction within or adjacent to any natural area and during the appropriate periods (e.g., seasons, weather conditions, times of day), a biologist/botanist shall survey the APE to identify native species (alliances, variety, and/or subspecies) within the natural areas that would be appropriate for revegetation.</u> As part of completion of the final site development, after ground disturbance has occurred within or adjacent to any natural area, the disturbed areas shall be revegetated using a plant mix of native plant species that are suitable for long term vegetation management at the specific site <u>as identified by the site biologist/botanist pre-construction survey</u>, which shall be implemented in cooperation with regulatory agencies and with oversight from a biologist. The seeds mix shall be verified to contain the minimum amount of <u>no</u> invasive plant species seeds. <u>If a seed mix without potential invasive species does not exist for the native species to the APE, the seed mix shall contain the absolute minimum amount of invasive species</u> reasonably available for the Program Area.</p>	Implementing Agency
<p>BIO-15 During construction, equipment will be washed before entering the project footprint to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species. Mud and plant materials will be removed from construction equipment when working in native plant communities, near special-status plant communities, or in areas where special-status plant species have been identified.</p>	Implementing Agency
<p>BIO-16 Personnel who work onsite will attend a Contractor Education and Environmental Training session conducted by a biologist. The environmental training will cover general and specific biological information on the special-status plant species that may be present near the construction site, including the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws.</p> <p>The Contractor Education and Environmental Training sessions will be given before the initiation of construction activities and repeated, as needed, when new personnel begin work within the project limits. Daily updates and synopsis of the training will be performed during the daily safety ("tailgate") meeting. All personnel who attend the training will be required to sign an attendance list stating that they have received the Contractor Education and Environmental Training, and such tracking sheets shall be maintained for inspection by the implementing agency.</p>	Implementing Agency
<p>BIO-17 Biological monitor to be present during construction activities in areas where impacts to Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. A biological monitor (or monitors) will be present onsite during construction activities that could result in direct or indirect impacts on sensitive biological resources (including listed species) and to oversee permit compliance and monitoring efforts for all special-status resources.</p> <p>A biological monitor (biologist) is any person who has a bachelor's degree in biological sciences, zoology, botany, ecology, or a closely related field and/or has demonstrated field experience in and knowledge about the identification and life history of the special-status species or jurisdictional waters that could be affected by project activities. The biological monitor(s) will be responsible for monitoring the Contractor to ensure compliance with the Section 404 Individual Permit, Section 401 Water Quality Certification and the Lake and Streambed Alteration (LSA) Agreement. Activities to ensure compliance would include performing construction-monitoring activities, including monitoring environmental fencing, identifying areas where special-status plant species are or may be present, and advising the Contractor of methods that may minimize or avoid impacts on these resources. Biological monitor(s) will be required to be present in all areas during ground disturbance activities and for all construction activities conducted within or adjacent to identified Environmentally Sensitive Areas, Wildlife Exclusion Fencing, and Non-Disturbance Zones as defined by the project biologist.</p>	Implementing Agency
<p>BIO-18 All food-related trash items (e.g., wrappers, cans, bottles, food scraps) will be disposed of in closed containers and removed at least once a week from the construction site.</p>	Implementing Agency
<p>BIO-19 Use of rodenticides and herbicides in the project footprint will be restricted at the direction of the project biologist. This measure is necessary to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species. Where pesticides must be used, they must be used in full accordance</p>	Implementing Agency

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
with use instructions for the particular chemical and at the direction of the project biologist.	
BIO-20 Exclusion barriers (e.g., silt fences) will be installed at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction. The design specifications of the exclusion fencing will be determined through consultation with the USFWS and/or CDFW, as appropriate. Clearance surveys will be conducted for special-status species after the exclusion fence is installed in compliance with USFWS and/or CDFW requirements. The project biologist shall determine the frequency in which clearance surveys will be conducted to determine the efficacy of the exclusion fencing.	Implementing Agency
BIO-21 Prior to the commencement of construction, the implementing agency shall identify staging areas for construction equipment to be utilized during construction that will be located outside sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridors.	Implementing Agency
BIO-22 Plastic mono-filament netting (erosion-control matting) or similar material will not be used in erosion control materials to prevent potential harm to wildlife. Materials such as coconut coir matting or tackified hydroseeding compounds will be used as substitutes.	Implementing Agency
BIO-23 During ground-disturbing activities, project-related vehicle traffic will be restricted within the construction area to established roads, construction areas, and other designated areas to prevent avoidable impacts. Access routes will be clearly flagged; traffic outside of the designated areas will be prohibited. Furthermore, the use of motorized vehicles within sensitive habitat areas and linkages shall be prohibited except for crucial maintenance and/or construction activities.	Implementing Agency
BIO-24 All excavated, steep-sided holes or trenches more than 8 inches deep will be covered at the close of each working day with plywood or similar materials, or a minimum of one escape ramp constructed of earth fill for every 10 feet of trenching will be provided to prevent the entrapment of wildlife. Before such holes or trenches are filled, they will be thoroughly inspected for trapped animals. All culverts or similar enclosed structures with a diameter of 4 inches or greater will be covered, screened, or stored more than 1 foot off the ground to prevent use by wildlife. Stored material will be cleared for common and special-status wildlife species before the pipe is subsequently used or moved.	Implementing Agency
BIO-25 Prior to the commencement of construction, a Weed Control Plan will be developed for the implementing agency by the project biologist to minimize or avoid the spread of weeds during ground-disturbing activities. In the Weed Control Plan, the following topics will be addressed: <ul style="list-style-type: none"> • A Schedule for noxious weed surveys shall be addressed; • Weed control treatments shall be addressed and ultimately implemented by the implementing agency, including permitted herbicides, and manual and mechanical methods for application; herbicide application will be restricted in Environmentally Sensitive Areas (as defined by the project biologist); • The timing of the weed control treatment for each plant species shall be addressed and • Fire prevention measures shall be addressed. The implementing agency shall maintain records demonstrating implementation of the Weed Control Plan, and shall make those records available to inspection by the implementing agency upon request.	Implementing Agency
BIO-26 Any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation. Mitigation can be provided by restoration of temporary impacts, enhancement of existing resources, or purchasing into any authorized mitigation bank or in-lieu fee program; by selecting a site of comparable acreage near the site and enhancing it with a native riparian habitat or invasive species removal in accordance with a habitat mitigation plan approved by regulatory agencies; or by acquiring sufficient compensating habitat to meet regulatory agency requirements. Typically, regulatory agencies require mitigation for Impacts to jurisdictional waters without any riparian or wetland habitat shall to be mitigated at a <u>minimum</u> 1:1 ratio, <u>with the ultimate compensatory mitigation ratio being determined through negotiation with regulatory agency, and never at a rate of less than 1:1. For less of any riparian or other wetland areas, the mitigation ratio will begin at 2:1, and t</u> he ratio will rise based on the type of habitat, habitat quality, and presence of sensitive or listed plants or animals in the	Implementing Agency

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>affected area. This increase in ratio will be determined by the regulatory agency <u>and must be deemed sufficient by the regulatory agency issuing the permit to compensate for/offset the impacts to the jurisdictional waters and supported species and habitats therein</u>. A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.</p>	
<p>BIO-27 A federal and state jurisdictional water preconstruction survey shall be conducted by a biologist or regulatory specialist at least six months before the start of ground-disturbing activities to identify and map all jurisdictional waters in the project footprint and up to a 250-foot buffer around the project footprint, subject to legal property access restrictions. The purpose of this survey is to confirm the extent of jurisdictional waters as defined by state and federal law are within the project footprint and adjacent up to 250-foot buffer. If possible, surveys would be performed during the spring, when plant species are in bloom and hydrological indicators are most readily identifiable. These results would then be used to calculate impact acreages and determine the amount of compensatory mitigation required to offset the loss of wetland functions and values in accordance with MM BIO-26.</p>	Implementing Agency
<p>BIO-28 To avoid an illegal take of active bird nests, any grubbing, brushing or tree removal will be conducted outside of the state identified nesting season for applicable bird species (nesting season is approximately from February 15 through September 15 of a given calendar year, depending on the species). <u>Alternatively Additionally, at the discretion of a qualified avian biologist, nesting bird surveys shall be required, where appropriate, regardless of the time of year shall be conducted by a qualified avian biologist</u> no more than three (3) days prior to vegetation clearing or ground disturbance activities.</p> <ul style="list-style-type: none"> • Preconstruction surveys shall focus on both direct and indirect evidence of nesting, including nest locations and nesting behavior. The qualified avian biologist will make every effort to avoid potential nest predation as a result of survey and monitoring efforts. If no active nests are found, no further action would be required. If an active nest is found, the biologist shall set appropriate no-work buffers around the nest which would be based upon the nesting species, its sensitivity to disturbance, nesting stage and expected types, intensity, and duration of disturbance. There are no standard nest buffers specified in the Migratory Bird Treaty Act (MBTA) or within the California Fish and Game Code (FGC). Disturbance factors including nest location, human activity, activity duration, and noise level may influence nesting behavior and reproductive success, shall be considered by the project biologist in coordination with CDFW and USFWS (as appropriate) in establishing standard buffer distances for individual species on a project- and site-specific basis. The nest(s) and buffer zones shall be field checked weekly by a qualified biological monitor. The approved no-work buffer zone shall be clearly marked in the field, within which no disturbance activity should commence until the qualified biologist has determined the young birds have successfully fledged and the nest is inactive; • Preconstruction nesting bird surveys shall include a nighttime component to address the potential for presence of nocturnal species. The nesting bird surveys shall consist of a minimum of five (5) consecutive survey days and shall include an additional three (3) consecutive nights of survey for nocturnal species. Nocturnal surveys shall be conducted between the hours of 9:00 pm. and midnight, during appropriate weather conditions (e.g., no rain or winds); and • Vegetation removal, including any tree removal or pruning, and structure demolition shall be conducted outside the typical nesting season (i.e., between September 1st and January 31st), to the maximum extent feasible. Otherwise, the provisions of the preconstruction nesting bird surveys, above, shall suffice to ensure impacts to nesting birds are minimized. 	Implementing Agency
<p>BIO-29 To avoid any harm to waterfowl that may utilize the Solar Evaporation Ponds, BBARWA shall install bird deterrents at the Solar Evaporation Ponds to discourage waterfowl use of the ponds. The deterrent shall encompass access control through tarps or screens limiting bird access to the surface of the Solar Evaporation Ponds.</p>	Implementing Agency

Impact Description	Impact After Mitigation
<p>BIOLOGICAL RESOURCES As described in Subchapter 4.5, there is a potential that a future Program facility may be developed in an area containing significant biological resources that cannot be avoided. Future</p>	<p>As described in Subchapter 4.5, though substantial mitigation is provided to minimize impacts under most circumstances for future Program facilities, no feasible mitigation exists to completely avoid impacts to biological</p>

Impact Description	Impact After Mitigation
<p>Program facilities may be installed within sites that contain significant biological resources that may be impacted without mitigation. These impacts may include direct impacts such as the removal or modification of local hydrology, the redirection of flow, and the placement of fill material. Potential indirect impacts on jurisdictional waters include a number of water-quality-related impacts such as erosion and transport of fine sediments or fill downstream of construction to unintentional release of contaminants into jurisdictional waters that are outside of the Program footprint. Temporary impacts on jurisdictional waters include the placement of temporary fill during construction in both man-made and natural jurisdictional waters. In the case of man-made features, these impacts would remove or disrupt the limited biological functions that these features provide. In natural areas, these activities would remove or disrupt the hydrology, vegetation, wildlife use, water quality conditions, and other biological functions provided by the resources. Furthermore, while it is recommended that the Program Team avoid implementing the Baldwin Lake Pipeline Alignment Option to further avoid impacts to bird-foot checkerbloom, the Baldwin Lake Pipeline Alignment Option is still being considered by BBARWA. Consequently, the Program could cause an unavoidable significant adverse or cumulatively considerable impact on biological resources.</p>	<p>resources within the Big Bear Valley. A potential to adversely impact bird-foot checkerbloom from Program implementation exists. This is because, while it is recommended that the Program Team avoid implementing the Baldwin Lake Pipeline Alignment Option to further avoid impacts to bird-foot checkerbloom, the Baldwin Lake Pipeline Alignment Option is still being considered by BBARWA. MM BIO-5 would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. Consequently, the Program could cause an unavoidable significant adverse or cumulatively considerable impact on biological resources. However, impacts to all other species and habitats were determined to be less than significant, through the implementation of MMs BIO-1 through BIO-28. Regardless, because of the potential for the Program to adversely impact the bird-foot checkerbloom, the proposed Program is forecast to cause significant unavoidable adverse impacts to biological resources if the Baldwin Lake Pipeline Alignment Option is selected.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>CULTURAL RESOURCES</p> <p>CUL-1 If the Sand Canyon Monitoring Wells are proposed within existing facilities that has been totally disturbed due to it undergoing past engineered site preparation (such as a well site), the agency implementing the project will not be required to complete a follow on cultural resources report (Phase I Cultural Resources Investigation) unless the implementing agency is seeking additional State or Federal funding, in which case the implementing agency shall prepare a Phase I Cultural Resources Investigation to satisfy State CEQA-plus or Federal agency requirements.</p>	<p>Implementing Agency</p>
<p>CUL-2 Where a Phase I Cultural Resources Investigation is not required or has already been completed (for all Program components except the Sand Canyon Monitoring Wells), the following shall be required to minimize impacts to any accidentally exposed cultural resource materials:</p> <ul style="list-style-type: none"> • Should any subsurface cultural resources be encountered during construction of these facilities, earthmoving or grading activities in the immediate area of the finds shall be halted and an onsite inspection shall be performed immediately by a qualified archaeologist meeting the Secretary of Interior Standards for Archaeology. Responsibility for making this determination shall be with the implementing agency's trained onsite inspector. An archaeological professional shall assess the find, determine its significance, and make recommendations for appropriate MMs in accordance with the State CEQA Guidelines. 	<p>Implementing Agency</p>
<p>CUL-3 If the Sand Canyon Monitoring Wells are proposed within undisturbed sites <u>and/or</u> a site that will require substantial earthmoving activities and/or excavation, <u>and/or</u> the implementing agency is seeking state or federal funding, the Implementing Agency shall complete a follow-on cultural resources report (Phase I Cultural Resources Investigation) regardless of whether implementing agency is seeking state or federal funding.</p> <p>Where a Phase I Cultural Resources Investigation is required, the following phases of identification, evaluation, mitigation, and monitoring shall be followed for the Sand Canyon Monitoring Wells:</p> <ol style="list-style-type: none"> 1. <u>Phase I (Identification)</u>: A Phase I Investigation to identify historical, archaeological, or paleontological resources in a project site shall include the following research procedures, as appropriate: <ul style="list-style-type: none"> • Focused historical/archaeological resources records searches at SCCIC and/or EIC, depending on the project location, and paleontological resources records searches by NHMLAC, SBCM, and/or the Western Science Center in Hemet; • Historical background research, geoarchaeological profile analysis, and paleontological literature review; 	<p>Implementing Agency</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<ul style="list-style-type: none"> • Consultation with the State of California Native American Heritage Commission, Native American tribes in the surrounding area in accordance with Assembly Bill 52 (AB 52), the Native American Historic Resource Protection Act, pertinent local government agencies, and local historic preservation groups; • Field survey of the Program Area by qualified professionals of the pertinent discipline and at the appropriate level of intensity as determined on the basis of sensitivity assessment and site conditions; and • Field recordation of any cultural resources encountered during the survey and proper documentation of the resources for incorporation into the appropriate inventories or databases. <p>2. Phase II (Evaluation): If cultural resources are encountered in a project site and cannot be avoided, a Phase II investigation shall be required to evaluate the potential significance of the resources in accordance with the statutory/regulatory framework outlined above. A typical Phase II study consists of the following research procedures:</p> <ul style="list-style-type: none"> • Preparation of a research design to discuss the specific goals and objectives of the study in the context of important scientific questions that may be addressed with the findings and the significance criteria to be used for the evaluation, and to formulate the proper methodology to accomplish such goals; • In-depth exploration of historical, archaeological, or paleontological literature, archival records, as well as oral historical accounts for information pertaining to the cultural resources under evaluation; • Fieldwork to ascertain the nature and extent of the archaeological/paleontological remains or resource-sensitive sediments identified during the Phase I study, such as surface collection of artifacts, controlled excavation of units, trenches, and/or shovel test pits, and collection of soil samples; and • Laboratory processing and analyses of the cultural artifacts, fossil specimens, and/or soil samples for the proper recovery, identification, recordation, and cataloguing of the materials collected during the fieldwork and to prepare the assemblage for permanent curation, if warranted. <p>3. Phase III (Mitigation/Data Recovery): For resources that prove to be significant under the appropriate criteria, mitigation of potential project impact is required. The first option is avoidance by selecting and implementing the Sand Canyon Monitoring Wells or selecting an alternative Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option at an alternative site without significant cultural or paleontological resources. Depending on the characteristics of each resource type and the unique aspects of significance for each individual resource, mitigation may be accomplished through a variety of different methods, which shall be determined by a qualified archaeologist, paleontologist, historian, or other applicable professional in the "cultural resources" field. Typical mitigation for historical, archaeological, or paleontological resources, however, may focus on the following procedures, aimed mainly at the preservation of physical and/or archival data about a significant cultural resource that would be impacted by the project:</p> <ul style="list-style-type: none"> • Data recovery through further excavation at an archaeological site or a paleontological locality to collect a representative sample of the identified remains, followed by laboratory processing and analysis as well as preparation for permanent curation; • Comprehensive documentation of architectural and historical data about a significant building, structure, or object using methods comparable to the appropriate level of the Historic American Buildings Survey (HABS) and the Historic American Engineering Record (HAER) for permanent curation at a repository or repositories that provides access to the public; and • Adjustments to project plans to minimize potential impact on the significance and integrity of the resource(s) in question. <p>4. Phase IV (Monitoring): At locations that are considered sensitive for subsurface deposits of undetected archaeological or paleontological remains, all earth-moving operations shall be monitored continuously or periodically, as warranted, by qualified professional practitioners. Archaeological monitoring programs shall be coordinated with the nearest Native American groups, who may wish to participate, as put forth in MMs TCR-1 through TCR-3.</p>	
<p>CUL-4 After each phase of the studies required by MM CUL-3 has been completed, where required, a complete report on the methods, results, and final conclusions of the research procedures shall be prepared and submitted to SCCIC, EIC, NHMLAC, and/or SBCM, as appropriate and in addition to the implementing agency for the project, for permanent documentation and easy references by future researchers.</p>	<p>Implementing Agency</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>CUL-5 <u>Archaeological Monitoring</u></p> <p>Due to the heightened cultural sensitivity of the proposed Program Area, an archaeological monitor with at least 3 years of regional experience in archaeology shall be present for ground-disturbing activities that occur within the proposed Program Area (which includes, but is not limited to, tree/shrub removal and planting, clearing/grubbing, grading, excavation, trenching, compaction, fence/gate removal and installation, drainage and irrigation removal and installation, hardscape installation [benches, signage, boulders, walls, seat walls, fountains, etc.], and archaeological work), for individual Replenish Big Bear Program components that are deemed by YSMN to be located within culturally sensitive areas of the Big Bear Valley. A sufficient number of archaeological monitors shall be present each work day to ensure that simultaneously occurring ground disturbing activities receive thorough levels of monitoring coverage. A Monitoring and Treatment Plan that is reflective of the project mitigation (“Cultural Resources” and “Tribal Cultural Resources”) shall be completed by the archaeological consultant and submitted to the Lead Agency for dissemination to the YSMN Cultural Resources Management Department. Once all parties review and approve the plan, it shall be adopted by the Lead Agency – the plan must be adopted prior to permitting for the Program. Any and all findings will be subject to the protocol detailed within the Monitoring and Treatment Plan.</p>	<p>Implementing Agency</p>

Impact Description	Impact After Mitigation
<p>CULTURAL RESOURCES</p> <p>As described in Subchapter 4.6, the Big Bear Valley is a large area that may contain historical, archaeological, tribal or paleontological resources. As such, future Program projects may be developed within sites that contain such resources. This site-specific Cultural Resources Report determined that no significant resources were known to occur within the Program APE, but that due to the high sensitivity of the Big Bear Valley, mitigation is necessary to reduce impacts from Program implementation.</p>	<p>As described in Subchapter 4.6, MM CUL-1 would exclude highly disturbed sites from requiring further cultural resource evaluation, in addition to those sites for which a cultural resource evaluation has already been prepared (all Program facilities except the Sand Canyon Monitoring Wells). MM CUL-1 would require the implementing agency to adhere to adaptive management procedures pertaining to treatment of cultural resources that may be accidentally discovered during earthmoving activities. MM CUL-2 would ensure that the Sand Canyon Monitoring Wells that are located within undisturbed areas, within a site that will require substantial earthmoving activities and/or excavation, and/or where the implementing agency is seeking state funding, will require a follow-on Phase I Cultural Resources Investigation. This MM includes several phases or steps beyond the completion of a Phase I Cultural Resources Investigation that would cover the identification, evaluation, mitigation, and monitoring associated with a given project where resources may be located. This would ensure that adequate mitigation is provided in the event that significant cultural resources are located within the Sand Canyon Monitoring Wells sites. MM CUL-3 would ensure that, after each phase of the studies required by MM CUL-2 has been completed, where required, a complete report on the methods, results, and final conclusions of the research procedures is prepared and submitted to SCCIC, EIC, NHMLAC, and/or SBCM. This would ensure that any discoveries are properly documented for future researchers that may seek information regarding the Program Infrastructure project site. MM CUL-4 would require archaeological monitoring where the YSMN deems the project activity to have a high potential for archaeological sensitivity. The monitor would ensure that any uncovered resources are handled appropriately, and thereby minimizing any potential significant impacts thereof. As described in Subchapter 4.6, no unavoidable significant impact to cultural resources will result from implementing the proposed Program.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>ENERGY</p> <p>No Mitigation Required.</p>	<p>--</p>

Impact Description	Impact After Mitigation
<p>ENERGY</p> <p>As discussed in Subchapter 4.7, Program construction and operation would not result in inefficient, wasteful or unnecessary consumption of energy and would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. This is because the Program would install a 2 MW solar array that would be capable of generating about 3,652,117 kWh per year, which is more than 95% of the necessary energy to accommodate the proposed Program. California Code of Regulations Title 13, Sections 2449 and 2485, limit idling from both on- road and off-road diesel-powered equipment and are enforced by CARB. The proposed Program would comply with these regulations. Thus, it is anticipated that construction of the proposed Program would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. The Program would be designed and constructed in accordance with the City of Big Bear Lake and San Bernardino County's latest adopted energy efficiency standards, which are based on the California Title 24 energy efficiency standards. Title 24 standards are widely regarded as the most advanced energy efficiency standards, would help reduce the amount of energy required for lighting, water heating, and heating and air conditioning in buildings and promote energy conservation. Compliance with mandatory measures would ensure that future development Programs would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. As BBARWA would use on-site renewable energy to accommodate more than 95% of the operational energy needs, the Program would not obstruct the 2022 Scoping Plan. Impacts would be less than significant. With compliance with current federal and state regulations pertaining to energy conservation, the proposed Program is anticipated to have a less than significant impact on energy demand and resources.</p>	<p>No mitigation is required. Impacts are less than significant.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>GEOLOGY AND SOILS</p> <p>GEO-1 Prior to the construction of each Program-related improvement, a design-level geotechnical investigation, including the collection of site-specific subsurface data if appropriate, shall be completed. The geotechnical evaluation shall identify all potential seismic hazards including ground shaking hazard, and characterize the soil profiles, including liquefaction potential, expansive soil potential, subsidence, and landslide potential as appropriate relative to the type of facility and risk to human life. The geotechnical investigation shall recommend site-specific design criteria to mitigate for seismic and non-seismic hazards, such as special foundations and structural setbacks, and these recommendations shall be incorporated into the design of individual projects. If the project specific geotechnical study cannot mitigate potential seismic related impacts, then the facility shall be relocated. If relocation is not possible, a second tier CEQA evaluation shall be completed.</p>	<p>Implementing Agency</p>
<p>GEO-2 For the Sand Canyon Recharge Area, the Program will develop and implement a recharge monitoring and management plan that will control recharge to ensure that potential liquefaction-ground failure hazards will be controlled to prevent/eliminate the potential for this type of hazard to be created at the recharge location. This may include pumping groundwater to lower the groundwater table within the recharge impact area. This plan shall be reviewed and approved by the Program managers based on its ability to meet this criterion.</p>	<p>Implementing Agency</p>
<p>GEO-3 For each site-specific project that is less than one acre in size requiring ground disturbing activities such as grading, the implementing agencies shall identify and implement BMPs to minimize soil erosion and loss of topsoil comparable to that which would be required under a SWPPP (BMPs may include, but are not limited to hay bales, wattles, detention basins, silt fences, coir rolls, etc.) to ensure that the discharge of the storm runoff from the construction site does not cause erosion downstream of the discharge point. If any substantial erosion or sedimentation occurs as a result of discharging storm water from a</p>	<p>Implementing Agency</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
project construction site, any erosion or sedimentation damage shall be restored to pre-discharge conditions.	
<p>GEO-4 For project-level development involving ground disturbance in alluvial deposits, a qualified paleontologist shall be retained to determine the necessity of conducting a study of the Program Area(s) based on the potential sensitivity of the project site for paleontological resources. If deemed necessary, the paleontologist shall conduct a paleontological resources inventory designed to identify potentially significant resources. The paleontological resources inventory would consist of: a paleontological resource records search to be conducted at the SBCM and/or other appropriate facilities; a field survey or monitoring where deemed appropriate by the paleontologist; and recordation of all identified paleontological resources. Treatment of any discovered paleontological resources shall follow current professional standards.</p>	Implementing Agency

Impact Description	Impact After Mitigation
<p>GEOLOGY AND SOILS The Big Bear Valley contains substantial geological and soils constraints. Due to these substantial constraints and the installation of future Program related facilities in locations where such constraints may occur, a potential for significant geology and soils resources impacts from implementation of the Program was identified.</p>	<p>Significant geology and soils impacts can be reduced through the implementation of mitigation. Several MMs were identified to minimize geology and soils impacts that would be applicable to both the Program, including those MMs that would: reduce potential impacts from geological hazards through a design level geotechnical investigation with implementation of specific design recommendations, relocation of the site, or subsequent CEQA documentation; minimize impacts to paleontological resources through requiring site-specific studies, where necessary. As described in Subchapter 4.8, no unavoidable significant impact to geology and soils will result from implementing the proposed Program.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>GREENHOUSE GASES No Mitigation Required.</p>	--

Impact Description	Impact After Mitigation
<p>GREENHOUSE GASES As described in Subchapter 4.9, implementation of the proposed Program will result in approximately 1,499.63 MTCO_{2e}/yr from construction and operational activities. As such, the Program would not exceed the SCAQMD's recommended numeric threshold of 3,000 MTCO_{2e} or 10,000 MTCO_{2e}/yr if it were applied. Thus, the Program would not result in a cumulatively considerable impact with respect to GHG emissions. By augmenting local water supplies, the Program would offset energy demands associated with obtaining other sources of water supply in furtherance of this goal of the 2022 Scoping Plan. Therefore, the Program would not conflict with the 2022 Scoping Plan, and no impact would occur. As concluded in Subchapter 4.9, the proposed Program would not have the potential to generate a significant amount of GHGs emissions. As such, the proposed Program will not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Program-related GHG emissions are not considered to be significant or adverse and would not result in an unavoidable significant adverse impact on global climate change.</p>	<p>No mitigation is required. Impacts are less than significant.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>HAZARDS AND HAZARDOUS MATERIALS HAZ-1 For Program facilities that handle hazardous materials or generate hazardous waste, the Hazardous Materials Business Plan (HMBP) prepared and submitted to the CUPA shall incorporate BMPs designed to minimize the potential for accidental release of such</p>	Implementing Agency

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
chemicals and shall meet the standards required by California law for HMBPs. The facility managers shall implement these measures to reduce the potential for accidental releases of hazardous materials or wastes. The HMBP shall be approved prior to operation of the given facility.	
HAZ-2 The HMBP shall assess the potential accidental release scenarios and identify the equipment and response capabilities required to provide immediate containment, control, and collection of any released hazardous material. Prior to issuance of the certificate of occupancy, each facility shall ensure that necessary equipment has been installed and training of personnel has occurred to obtain sufficient resources to control and prevent the spread of any accidentally released hazardous or toxic materials.	Implementing Agency
HAZ-3 Prior to occupancy of any site for which storage of any acutely hazardous material will be required, such as chlorine gas, modeling of pathways of release and potential exposure of the public to any released hazardous material shall be completed and specific measures, such as secondary containment, shall be implemented to ensure that sensitive receptors will not be exposed to significant health threats based on the toxic substance involved.	Implementing Agency
HAZ-4 All hazardous materials during both operation and construction of Program facilities shall be delivered to a licensed treatment, disposal, or recycling facility and be disposed of in accordance with State and Federal law.	Implementing Agency
HAZ-5 Before determining that an area contaminated as a result of an accidental release during project operation or construction is fully remediated, specific thresholds of acceptable clean-up shall be established and sufficient samples shall be taken and tested within the contaminated area to verify that these clean-up thresholds have been met in compliance with State and Federal law.	Implementing Agency
HAZ-6 Vector management plans shall be prepared and use of pesticides shall be reviewed and coordinated with the San Bernardino Vector Control Program for approval prior to implementing vector control at any of the new or expanded storage basins. All pesticides shall be applied in accordance with State and label requirements to minimize potential for residual concentrations that may be considered adverse to public health and water quality.	Implementing Agency
HAZ-7 All accidental spills or discharge of hazardous material during construction activities shall be reported to the local CUPA and shall be remediated in compliance with applicable Federal, State, and local regulations regarding cleanup and disposal of the contaminant released. The contaminated waste shall be collected and disposed of at a licensed disposal or treatment facility. This measure shall be incorporated into SWPPP prepared for each future facility developed under the Program, or where an SWPPP is not required due Project size, shall be incorporated as a BMP. Prior to accepting the site as remediated, the area contaminated shall be tested to verify that any residual concentrations meet the standard for future residential or public use of the site.	Implementing Agency
HAZ-8 Should an unknown contaminated site be encountered during construction of Program facilities, all work in the immediate area shall cease; the type of contamination and its extent shall be determined by a hazardous materials specialist, such as an Environmental Scientist; and the local CUPA or other regulatory agencies (such as the California Department of Toxic Substances Control or Santa Ana Regional Board) shall be notified. Based on investigations of the contamination, the site may be closed and avoided or the contaminant(s) shall be remediated to a threshold acceptable to the CUPA or other regulatory agency threshold and any contaminated soil or other material shall be delivered to an authorized treatment or disposal site.	Implementing Agency
HAZ-9 For projects within airport safety zones, facility design shall follow the guidelines of the appropriate airport land use compatibility plan (ALUCP). If a potential conflict with an ALUCP is identified as a result of implementation of the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, the implementing agency shall relocate the facility outside the area of conflict, or if the site is deemed essential, the implementing agency shall propose an alternative design that reduces any conflict to a less than significant impact, with no conflicts with the ALUCP.	Implementing Agency

Impact Description	Impact After Mitigation

Several MMs were identified to minimize hazards and hazardous materials impacts including those that would: ensure that applicable facilities Business Plans incorporate BMPs designed to minimize the potential for accidental release of such chemicals; ensure that applicable</p>

Impact Description	Impact After Mitigation
<p>implementation of the Program were identified in Subchapter 4.10.</p>	<p>facilities Business Plans identify the equipment and response capabilities required to provide immediate containment, control and collection of any released material; ensure sensitive receptors will not be exposed to significant health threat by modeling the pathways of release and implementing specific measures that would minimize potential exposure to acutely hazardous materials; ensure hazardous materials are disposed of and delivered to licensed facilities; ensure the establishment of and adherence to specific thresholds of acceptable clean-up of hazardous materials; ensure the preparation of and adherence to vector management plans; ensure remediation of an accidental spill or discharge of hazardous material in compliance with state and local regulations; ensure that sites for future facilities obtain a Phase I Environmental Site Assessment and either avoid or remediate a site that is contaminated; ensure that any unknown contamination is remediated and handled according to the local CUPA; ensure that construction traffic is managed safely; and ensure that fire hazard reduction measures are enforced. Therefore, though there will be some adverse impacts as a result of implementing the Program, specific MMs have been identified to reduce potential Program specific and cumulative (direct and indirect) impacts to a less than significant level for hazards and hazardous material issues. Thus, the Program is not forecast to cause any unavoidable significant adverse hazards or hazardous material impacts.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>HYDROLOGY AND WATER QUALITY</p> <p>HYD-1 BBARWA, in collaboration with BMWWD and BBCCSD, will collect samples at the pertaining locations. That is BBARWA will monitor the Program Water, BMWWD will collect samples in the Stanfield Marsh and Big Bear Lake, and BBCCSD will collect samples in Shay Pond. BBARWA will develop the AAMP and will coordinate with BMWWD and BBCCSD to implement the AMMP for the proposed discharges to Stanfield Marsh/Big Bear Lake and Shay Pond (when implemented). The AMMP will consist of the following;</p> <ul style="list-style-type: none"> • Conduct a monitoring plan to: <ul style="list-style-type: none"> ○ Collect quarterly boron samples of Program Water (i.e., purified water before it is discharged to Stanfield Marsh or Shay Pond (when implemented)), at the existing total maximum daily load (TMDL) Sampling Station MWDL9, and at Shay Pond (when implemented); ○ Monitor the dissolved oxygen and potential of hydrogen (pH) of the Program Water, in Stanfield Marsh (if permitted), at the existing TMDL Sampling Station MWDL9, and at Shay Pond (when implemented) during and after re-wetting of Stanfield Marsh or Shay Pond; ○ Continuously monitor temperature of the Program Water, Stanfield Marsh, and Shay Pond (when implemented); and ○ Collect quarterly chloride samples of Program Water stored in Big Bear Lake at the existing TMDL Sampling Station MWDL9 to assess the impacts on the Bear Valley Basin. ○ Collect nutrient (i.e., TIN, TP, TN, ammonia, nitrate as N, nitrite as N) samples of the Program Water at the frequency stated in the NPDES permit. • Implement a TP Offset Program, expected to be stipulated in BBARWA's future NPDES permit; • Monitor the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake on at least a bi-yearly basis. If observed, mitigative actions, such as invasive plant removal, introduction of native species known to eradicate invasive species, or other mitigative actions shall be undertaken to remove the invasive species present as a result of introduction of the Program Water. An account of invasive species within Stanfield Marsh and Big Bear Lake shall be undertaken prior to discharge into Stanfield Marsh to set a baseline for what invasive species exist prior to operation of the Program. 	<p>Implementing Agency</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>If temperature, dissolved oxygen, boron, or pH levels exceed the NPDES permit requirements, BBARWA shall pursue mitigation actions which may include, but are not limited to the following:</p> <ul style="list-style-type: none"> • Introduction of chemical or mechanical intervention to stabilize pH levels and dissolved oxygen. • Introduction of native plants to absorb boron at Stanfield Marsh or Shay Pond (when implemented). • Introduction of a temperature cooling mechanism to lower the temperature of the Program Water before being introduced to the Stanfield Marsh or Shay Pond (when implemented). <p>If recharging Program Water stored in Big Bear Lake would result in exceedance of any of the limits set in the future Sand Canyon Recharge Area WDR permit, the discharge of Program Water to the Sand Canyon Recharge Area would be paused until permit conditions are met.</p> <p>The AMMP shall be aligned with the future requirements of the NPDES and WDR permits.</p>	
<p>HYD-2 The Sand Canyon Recharge Project shall occur within the defined Sand Canyon Recharge Area shown on Figure 3-32, and shall <u>not</u> occur during periods where natural surface flows occur in the channel (i.e. the channel is completely dry). If the water discharged into Sand Canyon as a result of Program implementation does not fully percolate within the defined Sand Canyon Recharge Area, discharge to Sand Canyon will be modified (reduced or stopped) to a point at which full percolation occurs within the limits of the defined Sand Canyon Recharge Area.</p>	Implementing Agency
<p>HYD-3 BBLDWP shall monitor the discharge and percolation performance in compliance with the terms of the WDR permit for the Sand Canyon Recharge Area Project operation. The terms of the permit will be defined by the Santa Ana Regional Board and the DDW.</p>	Implementing Agency
<p>HYD-4 Prior to the commencement of construction of any Program project that will disturb less than one acre (i.e., that is not subject to the CGP), the implementing agency shall require implementation of and construction contractor(s) shall select BMPs to achieve a reduction in pollutants from stormwater discharge to the maximum extent practicable during the construction of each Program facility, and to control urban runoff after each Program facility is constructed and is in operation. Examples of BMP(s) that would achieve a reduction in pollutants include, but are not limited to:</p> <ul style="list-style-type: none"> • The use of silt fences or coir rolls; • The use of temporary stormwater desilting or retention basins; • The use of water bars to reduce the velocity of stormwater runoff; • The use of wheel washers on construction equipment leaving the site; • The washing of silt from public roads at the access point to the site to prevent the tracking of silt and other pollutants from the site onto public roads; • The storage of excavated material shall be kept to the minimum necessary to efficiently perform the construction activities required. Excavated or stockpiled material shall not be stored in water courses or other areas subject to the flow of surface water; and • Where feasible, stockpiled material shall be covered with waterproof material during rain events to control erosion of soil from the stockpiles. 	Implementing Agency
<p>HYD-5 Prior to commencement of construction of project facilities, the implementing agency shall be required to either:</p> <ol style="list-style-type: none"> (1) Prepare a No Net Discharge Report demonstrating that within each facility surface runoff shall be collected and retained (for use onsite) or detained and percolated into the ground on the site such that site development results in no net increase in offsite stormwater flows. Detainment shall be achieved through Low Impact Development techniques whenever feasible, and shall include techniques that remove the majority of urban storm runoff pollutants, such as petroleum products and sediment. The purpose of this measure is to remove the onsite contribution to cumulative urban storm runoff and ensure the discharge from the sites is treated to reduce contributions of urban pollutants to downstream flows and to groundwater; or, where it is not feasible to eliminate stormwater flows off of a site or where otherwise appropriate, the implementing agency shall: (2) Prepare a grading and drainage plan that identifies anticipated changes in flow that would occur on site and minimizes any potential increases in discharge, erosion, or sedimentation potential in accordance with applicable regulations and requirements for the County and/or the City in which the facility would be located. In addition, all new drainage facilities shall be designed in accordance with standards and regulations. The plan shall identify and implement retention basins, BMPs, and other measures to ensure that potential increases in storm 	Implementing Agency

water flows and erosion would be minimized, in accordance with local requirements.	
HYD-6 For long-term mitigation of site disturbances at Program facility locations, all areas not covered by structures shall be covered with hardscape (concrete, asphalt, gravel, etc.), native vegetation and/or man-made landscape areas (for example, grass). Revegetated or landscaped areas shall provide sufficient cover to ensure that, after a two-year period, erosion will not occur from concentrated flows (rills, gully, etc.) and sediment transport will be minimal as part of sheet flows.	Implementing Agency

Impact Description	Impact After Mitigation
<p>HYDROLOGY AND WATER QUALITY</p> <p>As described in Subchapter 4.11, the overall hydrology (watershed, drainage and flood hazards) and water quality impacts that would result from implementation of the Program could be significant without the implementation of substantive MMs. As such, several MMs were identified to minimize impacts related to hydrology and water quality.</p>	<p>The Program will provide a local, drought-resistant water supply with up to 380 AFY used of new water to sustain groundwater levels and storage in the Bear Valley Basin, with even greater potential for water savings through use of Program water stored in Big Bear Lake water to serve the Bear Mountain Golf Course, Snow Summit Bike Park, and other uses. Furthermore, an analysis of water quality objectives determined that the proposed Program discharge to Big Bear Lake, recharge at Sand Canyon, and discharge to Shay Pond would not conflict with any water quality objectives, and as the proposed Program would also contribute additional groundwater through the Sand Canyon Recharge Area, no significant hydrological impacts are anticipated to occur in the Big Bear Valley from Program implementation.</p> <p>Mitigation has been identified to minimize drainage pattern and flood hazard impacts that may occur under the Program as follows: either surface runoff shall be collected and retained or a grading and drainage plan would be developed during project design and implemented to ensure that pollutants are managed on site and the potential for risk of release thereof due to inundation is minimized, overland flows and drainage at each Program facility site would be assessed and drainage facilities would be designed such that no net increase in runoff would occur; in accordance with the San Bernardino County MS4 Permit, require implementation of BMPs for projects of less than one acre in size that would be comparable to the requirements of the NPDES Construction General Permit (CGP) and SWPPP, which are required for larger projects; ensure that the Sand Canyon Recharge Project operations occur within the defined area on Figure 3-32, and that operations would be modified if the recharge was not to fully percolate; require BBLDWP to monitor the discharge and percolation performance in compliance with the terms of the WDR permit for the Sand Canyon Recharge Project operation; and, ensure that monitoring and adaptive mitigation is implemented to protect to beneficial uses of Stanfield Marsh and Big Bear Lake, minimizing impacts thereof. As an identified project within the Bear Valley Basin Groundwater Sustainability Plan (GSP), the Program would not obstruct the implementation of the Bear Valley Basin GSP, and in fact, it would aid in its implementation. Therefore, there is no potential to conflict with or obstruct the implementation of sustainable groundwater management plan in the Bear Valley Basin.</p> <p>While the Program would reduce the overall recharge to the Lucerne Valley Basin, this would not conflict with the implementation of sustainable groundwater management plan, as none are applicable to the Lucerne Valley Basin/MBA. The MBA Watermaster, which has authority to manage the adjudicated MBA, would formulate a response to address the management of the Lucerne Valley Basin as a result of the reduction in recharge to the Lucerne Valley Basin. As this is the MBA Watermaster's responsibility, the</p>

Impact Description	Impact After Mitigation
	<p>Program would not result in a significant potential to conflict with the implementation of a sustainable groundwater management plan. Based on the above discussion, the continued, but reduced, discharge of BBARWA's secondary effluent to the LV Site under the Program will have the potential to contribute to the degradation of water quality in the Lucerne Valley Basin by removing a dilution source, but is not the direct cause of degradation because BBARWA effluent is only a minor contributor and not the primary source of degradation. The Lucerne Valley Basin currently exceeds the MCLs for TDS (recommended) and nitrate, so the reduced flows would not cause the Basin to violate a water quality standard, WDRs or otherwise substantially degrade surface or groundwater quality, but may result in a further exceedance of TDS and Nitrate, which is a potentially significant and unavoidable impact.</p> <p>The Program has a potential to interfere substantially with groundwater recharge such the project may impede sustainable groundwater management of the Lucerne Valley Basin as a result of the reduction in discharge to the LV Site. Finally, the Program has a potential to conflict with or obstruct the Colorado Basin Plan for the same reasons the Program has a potential to substantially degrade groundwater quality of the Lucerne Valley Basin discussed above. Thus, the Program would result in cumulatively significant and significant and unavoidable impacts under hydrology and water quality. As such, the Program would result in cumulatively significant and significant and unavoidable impacts under hydrology and water quality as a result of the reduction in discharge to the LV Site. No feasible MMs exist to avoid these significant and unavoidable impacts.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>LAND USE & PLANNING</p> <p>LU-1 Following selection of sites for future Replenish Big Bear Program related facilities, each site and associated facility shall be evaluated for potential incompatibility with adjacent existing or proposed land uses. Where future facility operations can create significant incompatibilities (lighting, noise, use of hazardous materials, traffic, etc.) with adjacent uses, an alternative site shall be selected, or subsequent CEQA documentation shall be prepared that identifies the specific project design features or MMs that will be utilized to reduce potential incompatible activities or effects to below significance thresholds established in the general plan for the jurisdiction where the facility will be located.</p>	<p>--</p>

Impact Description	Impact After Mitigation
<p>LAND USE & PLANNING</p> <p>As described in Subchapter 4.12, the Program does not propose any action that could physically divide an established community. The Program would not conflict with the goals and policies of the applicable General Plans. In addition, implementing agency would coordinate directly with local agencies with jurisdiction to ensure compatibility with existing adjacent land uses. While the potential loss of agricultural operations and agricultural lands that is projected to occur as a result of Program implementation would be significant and unavoidable, given that the continued agricultural operation of the whole of the site (190 acres) would not be sustainable or feasible once the Program is implemented, the proposed Program does not conflict with any General Plan goal and policy. The Program is anticipated to result in a less than significant impact to scenic resources, and furthermore, would preserve and enhance Big Bear Lake and Stanfield Marsh through the provision of additional water, which would result in higher lake levels, enhance recreational opportunities and</p>	<p>As described in Subchapter 4.12, impacts related to land use and planning are minimal; however, mitigation is provided to address the potential for conflicts with land use from Program related facilities. This mitigation would ensure that the facilities associated with the Program are developed in appropriate areas, and conform with the surrounding land uses or are developed to minimize conflicts with adjacent land uses. With implementation of this MM, the Program-related land use and planning impacts can be reduced below a level of significance, and as such, the proposed Program will not cause unavoidable significant land use and planning impacts.</p>

Impact Description	Impact After Mitigation
<p>aquatic habitat, and support water quality improvements, thereby complying the General Plan goals and policies pertaining to preservation of scenic resources. Furthermore, the San Bernardino Countywide Plan and City of Big Bear Lake General Plan contain several goals and policies pertaining to the provision of adequate water supply, adapting to climate change, and addressing long-range water supply challenges, in fact Big Bear Lake identifies retaining BBARWA effluent on the mountain for Big Bear Valley use as a policy. As such, the proposed Program would not conflict with goals and policies pertaining to this topic. However, a potential conflict could result from future Program facilities being developed in locations that are incompatible (as a result of lighting, noise, use of hazardous materials, traffic, etc.) with adjacent uses. As such, mitigation is required to reduce potentially significant land use and planning impacts.</p>	

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>MINERAL RESOURCES No Mitigation Required.</p>	<p>--</p>

Impact Description	Impact After Mitigation
<p>MINERAL RESOURCES As described in Subchapter 4.13, a review of mining operations shown on Figure 4.13-1, indicates that there are no existing mining operations within the Program Area (refer to the Figure 3-29 for a visual depiction of the facilities proposed as part of the Program), and furthermore, there are no existing mines shown on San Bernardino County's list of known mining operations in the Big Bear Valley. As such, as no mining operations exist within the Big Bear Valley, and no areas within the Program footprint are designated for mineral extraction, the proposed Program would not result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. Furthermore, implementation of the Program will not have a significant adverse potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. Thus, Program-related mineral resource impacts can be reduced below a level of significance, and as such, the proposed Program will not cause unavoidable significant mineral resource impacts.</p>	<p>No mitigation is required. Impacts are less than significant.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>NOISE NOI-1: To comply with the day- and nighttime noise level limit during the whole of well drilling activities, noise barriers with a minimum height of 14 ft shall be erected surrounding the drilling rig monitoring well locations such that the pumps, compressors, and the drilling rig are completely shielded from nearby residential areas. An effective barrier requires a weight of at least 2 pounds per square foot (sf) of face area with no decorative cutouts, perforations, or line-of-sight openings between shielded areas and the source. Examples of temporary barrier material includes 5/8 inch plywood, 5/8 inch oriented-strand board, or sound blankets capable of providing a minimum sound transmission loss (STC) of 27 or a noise reduction coefficient (NRC) of 0.85.</p>	<p>Implementing Agency</p>

Impact Description	Impact After Mitigation
<p>NOISE The Big Bear Valley contains extensive areas with noise sensitive land uses. Due to these substantial noise constraints and the installation of future noise-producing Program facilities in locations where such noise sensitive uses may exist, a potential</p>	<p>As described in Subchapter 4.14, the highest construction noise levels during the installation of the solar evaporation ponds and Sand Canyon Monitoring Wells drilling activities noise levels are expected to exceed the daytime and nighttime noise level limit at the nearest receiver locations</p>

Impact Description	Impact After Mitigation
<p>exists for significant noise impacts from implementation of the Program. However, operational and off-site traffic noise is considered less than significant as described below. Additionally, construction vibration and aircraft noise impacts were determined to be less than significant. The Program will include several improvements at the BBARWA WWTP; however, all new noise sources would be housed inside the new building and the two pumps at the BBARWA WWTP would be housed in CMU buildings. Similarly, the proposed Sand Canyon pump station would be housed in a CMU building. The proposed structures would achieve between 40 and 50 dBA in noise reduction from pump noise to exterior locations. The proposed pumps are anticipated to generate up to 60 dBA at 32 feet. Based on the anticipated reduction, pump noise would be 30 dBA L_{eq} less outside the building. Therefore, operational noise sources would be well controlled and are not anticipated to result in substantial noise level increases.</p> <p>Furthermore, the limited number of trips would not have the potential to double traffic volumes even on low-volume local roadways. Thus, it is unlikely that individual projects implemented under the Program would increase off-site traffic noise levels by 3 dBA. Therefore, off-site traffic noise impacts would be less than significant, and no mitigation is required.</p> <p>Program construction was modeled to occur simultaneously, and was determined to result in a less than significant impact for all facilities except for the Sand Canyon Monitoring Wells since the locations are unknown, which, without mitigation, could result in significant and unavoidable noise impacts at the nearest sensitive receptors.</p>	<p>within 125 feet and 325 feet, respectively. Since the exact locations of these activities are unknown, and these activities would occur for 24 hours a day for up to two weeks, without mitigation these activities will exceed the applicable noise level limit during the nighttime if located within 325 feet of residences. This would be considered a significant impact. Therefore, mitigation is required for nighttime monitoring well drilling activities at the Sand Canyon Recharge Area. With implementation of the barrier noise levels would be reduced to a maximum noise level of 69 dBA L_{eq} at 50 feet. None of the potential monitoring well locations would be located within 50 feet of residences. With implementation of these MMs, the Program-related noise impacts can be reduced to a less than significant impact level.</p>

Environmental Category / Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>POPULATION AND HOUSING No Mitigation Required.</p>	<p>--</p>

Impact Description	Impact After Mitigation
<p>POPULATION AND HOUSING As described in Subchapter 4.15, implementation of the Program would not significantly induce growth within the Big Bear Valley. It is anticipated that, while the proposed Sand Canyon Recharge Conveyance Pipeline will be required to traverse through residential property, it will not impact the residential structures themselves. The effort to install the proposed pipeline alignment would not displace any persons or housing. Based on the historic growth pattern in the Big Bear Valley communities and future forecast of growth in the 2020 UWMPs, implementation of the proposed Program is not forecast to cause the less than 1% growth forecast for the Big Bear Valley to change in the future. Where the present availability of water does not serve as a constraint to growth, the Program's contribution to planning and expanding water system infrastructure to meet this future demand or changes in climate is considered growth accommodating, not growth inducing. As such and as stated above, the proposed Program is growth accommodating, and it does not in and of itself create opportunities for additional people to move to the region, nor to construct additional housing beyond those previously under consideration to accommodate the population envisioned within the City of Big Bear Lake General Plan and San Bernardino Countywide Plan. Therefore, the implementation of the proposed Program would result in less than significant impacts related to inducement of substantial population growth. A such,</p>	<p>No mitigation is required. Impacts are less than significant.</p>

Impact Description	Impact After Mitigation
the project-related population and housing impacts are less than significant, and as such, the proposed Program will not cause unavoidable significant population and housing impacts.	

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
PUBLIC SERVICES PS-1 The Program facilities shall be fenced or otherwise have access controlled to prevent illegal trespass to attractive nuisances during operation and construction equipment shall be fenced or otherwise have access controlled at the close of each work day. Furthermore, the Program facilities shall include security lighting to deter illegal trespass to attractive nuisances as part of both operation and construction. The security lighting shall be shielded from adjacent sensitive receptors, such as residences per MM AES-67 and AES-78 .	Implementing Agency

Impact Description	Impact After Mitigation
PUBLIC SERVICES Due to the limited population increase that would occur as a result of implementation of the Program, the demand for public services (fire, sheriff, schools, libraries, etc.) would be minimal. However, it is anticipated that all sites containing facilities associated with the proposed Program would be fenced in and contain security lighting, which would minimize the future need for police protection from trespass. Though a significant demand for police protection services is not anticipated, mitigation is proposed to address trespass issues.	As described in Subchapter 4.16 , implementation of the Program would not significantly impact fire protection, police protection, schools, recreation/parks or other public facilities. However, mitigation was identified to minimize impacts to police protection that would: minimize the potential for trespass that could exacerbate demand for police protection services. With implementation of this MM , the Program-related police protection and park/recreation impacts can be reduced to a less than significant impact level.

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
RECREATION No Mitigation Required.	--

Impact Description	Impact After Mitigation
RECREATION As described in Subchapter 4.17 , implementation of the Program would not significantly impact recreation. As discussed under Population and Housing, there would not be a direct increase in population or a substantial number of new jobs that would result in increased demand for parks and recreational facilities within the Big Bear Valley. Additionally, the majority of construction and operations and maintenance staff for any new facilities can be expected to be drawn from the existing population within the Big Bear Valley. The proposed Program may result in enhanced settings at Stanfield Marsh and Big Bear Lake, which is an objective of the Program and thereby may increase recreational opportunities therein. However, recreational infrastructure and fee mechanisms are in place to accommodate any increase in recreation at these locations. Thus, the Program-related recreation impacts would be less than significant, and proposed Program will not cause unavoidable significant recreation impacts.	No mitigation is required. Impacts are less than significant.

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
TRANSPORTATION TRAN-1: <u>Prepare and Implement Construction Transportation Management Plan (TMP)</u> A construction TMP shall be developed and implemented by the implementing agency, in coordination with the respective jurisdictions, the San Bernardino County Transportation Authority (SBCTA), and/or other relevant parties during construction of the proposed	Implementing Agency

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>project. The TMP shall conform to Caltrans' Transportation Management Plan Guidelines and shall include but is not limited to:</p> <p><u>Construction Traffic Routes and Staging Locations:</u> The TMP shall identify construction staging site locations and potential road closures, alternate routes for detours, and planned truck routes for construction-related vehicle trips, including but not limited to haul trucks, material delivery trucks, and equipment delivery trucks. It shall also identify alternative safe routes and policies to maintain safety along bicycle and pedestrian routes during construction. Construction vehicle routes shall avoid local residential streets and avoid peak morning and evening commute hours to the maximum extent practicable. Staging locations, alternate detour routes, and construction vehicle routes shall avoid other active construction projects within 0.25 mile of the project construction sites to the maximum extent practicable.</p> <p><u>Damage Repair:</u> The TMP shall include the following requirements to minimize damage to the existing roadway network:</p> <ul style="list-style-type: none"> • A list of precautionary measures to protect the existing roadway network, including but not limited to pavements, curbs, gutters, sidewalks, and drainage structures, shall be outlined. The construction contractor(s) shall be required to implement these measures throughout the duration of construction of the water Conveyance Pipelines. • The roadway network along the proposed Program Water distribution alignment(s) shall be surveyed prior to the start of project construction activities, and existing roadway conditions shall be summarized in a brief report. • Any damage to the roadway network that occurs as a result of project construction activities shall be noted, and the implementing agency or its contractors shall repair all damage. <p><u>Coordination with Emergency Services:</u> The TMP shall include requirements to notify local emergency response providers, including relevant police and sheriff departments, ambulance services, and paramedic services at least one week prior to the start of work within public ROW if lane and/or road closures are required. To the extent practicable, the duration of disruptions/closures to roadways and critical access points for emergency services shall be minimized.</p> <p><u>Coordination with Active Transportation Facilities:</u> The TMP shall require coordination with owners/operators of any affected active transportation facilities to minimize the duration of disruptions/closures to bike paths, pedestrian trails, and adjacent access points.</p> <p><u>Coordination with SBCTA:</u> If the proposed project affects access to existing transit stops, the TMP shall also include temporary, alternative transit stops and directional signage, as determined in coordination with Mountain Transit.</p> <p><u>Coordination with Caltrans:</u> If the proposed project requires lane and/or road closures of State highways or State highway ramps, the TMP shall require coordination with Caltrans to ensure the TMP conforms with Caltrans' Transportation Management Plan Guidelines.</p> <p><u>Coordination with Nearby Construction Sites:</u> The TMP shall identify all active construction projects within 0.25 mile of project construction sites and require coordination with the applicants and/or contractors of these projects during all phases of construction regarding the following:</p> <ul style="list-style-type: none"> • All temporary lane and/or roadway closures shall be coordinated to limit overlap of roadway closures; • All major deliveries and haul truck trips shall be coordinated to limit the occurrence of simultaneous deliveries and haul truck trips; and • The implementing agency, its contractor(s), or its representative(s) shall meet on a regular basis with the applicant(s), contractor(s) or their representative(s) of active construction projects within 0.25 mile of the project construction sites during construction to address any outstanding issues related to construction vehicles. <p><u>Transportation Control and Safety:</u> The TMP shall provide for roadway vehicle control measures including flag persons, warning signs, lights, barricades, cones, and/or detour routes to provide safe passage of vehicular, bicycle, and pedestrian circulation and access by emergency responders.</p> <p><u>Plan Approval:</u> The TMP shall be submitted to SBCTA for review and approval.</p>	

Impact Description	Impact After Mitigation
<p>TRANSPORTATION</p> <p>Since transportation system facilities occur throughout much of the Big Bear Valley and the installation of future water infrastructure facilities can directly impact roadways or traffic on such roadways, a potential for significant transportation/traffic impacts from implementation of the Program was identified in Subchapter 4.18. Construction requires mitigation to implement a TMP. In the long-term, operation of the Program will generate minimal traffic. Ultimately, operation of the Program would not generate a significant traffic impact and no operational mitigation is required.</p>	<p>Impacts to nearby roadways during construction can be mitigated through implementation of mitigation to ensure that a TMP is put in place. This mitigation would minimize impacts to transportation from construction by requiring all construction activities to be conducted in accordance with an approved construction traffic management plan. With implementation of this MM, the Program-related transportation impacts can be reduced below the level of significance, and as such, the proposed Program will not cause unavoidable significant recreation impacts.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>TRIBAL CULTURAL RESOURCES</p> <p>TCR-1 <u>Tribal Monitoring</u></p> <p>Due to the heightened cultural sensitivity of the proposed Program Area in Big Bear Valley, at the discretion of the Tribe, a Tribal monitor shall be present for all ground-disturbing activities that occur within the proposed Program Area (which includes, but is not limited to, tree/shrub removal and planting, clearing/grubbing, grading, excavation, trenching, compaction, fence/gate removal and installation, drainage and irrigation removal and installation, hardscape installation [benches, signage, boulders, walls, seat walls, fountains, etc.], and archaeological work). At the discretion of the Tribe, a sufficient number of Tribal monitors shall be present each work day to ensure that simultaneously occurring ground disturbing activities receive thorough levels of monitoring coverage. A Monitoring and Treatment Plan that is reflective of the project mitigation (“Cultural Resources” and “Tribal Cultural Resources”) shall be completed by the consultant, as detailed within CUL-1, and submitted to the Lead Agency for dissemination to the YSMN Cultural Resources Management Department. Once all parties review and agree to the plan, it shall be adopted by the Lead Agency – the plan must be adopted prior to permitting for the project. Any and all findings will be subject to the protocol detailed within the Monitoring and Treatment Plan.</p>	<p>Implementing Agency</p>
<p>TCR-2 <u>Treatment of Cultural Resources</u></p> <p>If a pre-contact cultural resource is discovered during archaeological presence/absence testing, the discovery shall be properly recorded and then reburied in situ. A research design shall be developed by the archaeologist that shall include a plan to evaluate the resource for significance under CEQA criteria. Representatives from the YSMN Cultural Resources Management Department, the archaeologist, and the Lead Agency shall confer regarding the research design, as well as any testing efforts needed to delineate the resource boundary. Following the completion of evaluation efforts, all parties shall confer regarding the archaeological significance of the resource, its potential as a TCR, avoidance (or other appropriate treatment) of the discovered resource, and the potential need for construction monitoring during project implementation. Should any significant resource and/or TCR not be a candidate for avoidance or preservation in place, and the removal of the resource(s) is necessary to mitigate impacts, the research design shall include a comprehensive discussion of sampling strategies, resource processing, analysis, and reporting protocols/obligations. Removal of any cultural resource(s) shall be conducted with the presence of a Tribal monitor representing the Tribe, unless otherwise decided by YSMN. All plans for analysis shall be reviewed and approved by the implementing agency and YSMN prior to implementation, and all removed material shall be temporarily curated on-site. It is the preference of YSMN that removed cultural material be reburied as close to the original find location as possible. However, should reburial within/near the original find location during project implementation not be feasible, then a reburial location for future reburial shall be decided upon by YSMN, the landowner, and the Lead Agency, and all finds shall be reburied within this location. Additionally, in this case, reburial shall not occur until all ground-disturbing activities associated with the project have been completed, all monitoring has ceased, all cataloguing and basic recordation of cultural resources have been completed, and a final monitoring report has been issued to Lead Agency, California Historical Resources Information System (CHRIS), and YSMN. All reburials are subject to a reburial agreement that shall be developed between the landowner and YSMN outlining the determined reburial process/location, and shall include measures and provisions to protect the reburial area from any future impacts (vis a vis project plans, conservation/preservation easements, etc.).</p>	<p>Implementing Agency</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>Should it occur that avoidance, preservation in place, and on-site reburial are not an option for treatment, the landowner shall relinquish all ownership and rights to this material and confer with YSMN to identify an American Association of Museums (AAM)-accredited facility within San Bernardino County that can accession the materials into their permanent collections and provide for the proper care of these objects in accordance with the 1993 California (CA) Curation Guidelines. A curation agreement with an appropriate qualified repository shall be developed between the landowner and museum that legally and physically transfers the collections and associated records to the facility. This agreement shall stipulate the payment of fees necessary for permanent curation of the collections and associated records and the obligation of the Project implementing agency to pay for those fees.</p> <p>All draft records/reports containing the significance and treatment findings and data recovery results shall be prepared by the archaeologist and submitted to the Lead Agency and YSMN for their review and comment. After approval from all parties, the final reports and site/isolate records are to be submitted to the local CHRIS Information Center, the Lead Agency, and YSMN.</p>	
<p>TCR-3 <u>Inadvertent Discoveries of Human Remains/Funerary Objects</u> In the event that any human remains are discovered within the Program Area, ground disturbing activities shall be suspended 100 feet around the resource(s) and an Environmentally Sensitive Area physical demarcation/barrier constructed. The on-site lead/foreman shall then immediately who shall notify YSMN and the Lead Agency. The Lead Agency shall then immediately contact the County Coroner regarding the discovery. If the Coroner recognizes the human remains to be those of a Native American, or has reason to believe that they are those of a Native American, the Coroner shall ensure that notification is provided to the Native American Heritage Commission (NAHC) within twenty-four (24) hours of the determination, as required by California Health and Safety Code § 7050.5 (c). The NAHC-identified Most Likely Descendant (MLD), shall be allowed, under California Public Resources Code § 5097.98 (a), to (1) inspect the site of the discovery and (2) make determinations as to how the human remains and funerary objects shall be treated and disposed of with appropriate dignity. The MLD, Lead Agency, and landowner agree to discuss in good faith what constitutes "appropriate dignity" as that term is used in the applicable statutes. The MLD shall complete its inspection and make recommendations within forty-eight (48) hours of the site visit, as required by California Public Resources Code § 5097.98.</p> <p>Reburial of human remains and/or funerary objects (those artifacts associated with any human remains or funerary rites) shall be accomplished in compliance with the California Public Resources Code § 5097.98 (a) and (b). The MLD in consultation with the landowner, shall make the final discretionary determination regarding the appropriate disposition and treatment of human remains and funerary objects. All parties are aware that the MLD may wish to rebury the human remains and associated funerary objects on or near the site of their discovery, in an area that shall not be subject to future subsurface disturbances. The Lead Agency/landowner should accommodate on-site reburial in a location mutually agreed upon by the Parties.</p> <p>It is understood by all Parties that unless otherwise required by law, the site of any reburial of Native American human remains or cultural artifacts shall not be disclosed and shall not be governed by public disclosure requirements of the California Public Records Act. The Coroner, parties, and Lead Agencies, will be asked to withhold public disclosure information related to such reburial, pursuant to the specific exemption set forth in California Government Code § 6254 (r).</p>	<p>Implementing Agency</p>
<p>TCR-4 <u>Pre-construction Cultural Sensitivity Training</u> Due to the heightened cultural sensitivity of the proposed Program Area in Big Bear Valley, a Tribal monitor representing YSMN or a Tribal representative of YSMN shall conduct a cultural sensitivity training at the start of construction for all on-site project personnel. The training may speak to, but is not limited to, the general cultural sensitivity of the area, the types of cultural resources that may be identified during construction, and the protocols for inadvertent discoveries.</p>	
<p>TCR-5 <u>Tribal Consultation for Aesthetics of Treatment Plant Modification</u> The Lead Agency and consultant shall consult with YSMN regarding the aesthetics of the water treatment plant modifications, specifically regarding the color palette. The consultation will address how the design elements can incorporate a natural-looking aesthetic in order to blend into the culturally significant Baldwin Lake landscape.</p>	

Impact Description	Impact After Mitigation
<p>TRIBAL CULTURAL RESOURCES</p> <p>As described in Subchapter 4.19 of this DPEIR, as described in Subchapter 4.19 of this DPEIR, the YSMN requested continued participation with this Program's CEQA process and future projects implemented under the Program. Concerns expressed include the following: accidental exposure of subsurface cultural resources and proper management of such resources; concerns over exposure of human remains and proper management; presence of Native American monitors during future ground disturbing activities; education of construction workers on tribal history and the potential for resources; and, consultation on the color of the liner for the Solar Evaporation Ponds.</p>	<p>Through incorporation of MMs, impacts to TCRs are considered less than significant. The MMs would prevent accidental exposure of subsurface cultural resources and proper management of such resources; minimize potential impacts related to exposure of human remains and proper management; require the presence of Native American monitors during future ground disturbing activities; require education of construction workers on tribal history and the potential for resources; and, require consultation on the color of the liner for the Solar Evaporation Ponds. Through incorporation of MMs, impacts to TCRs are considered less than significant. Thus, with implementation of mitigation to protect TCRs, the Program would not cause significant unavoidable adverse impacts to TCRs.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>UTILITIES AND SERVICE SYSTEMS</p> <p>UTIL-1 Prior to issuance of permits for construction of project facilities, the implementing agency shall prepare a drainage plan that shall be incorporated into the final site design for each Program facility, that includes design features to reduce stormwater peak concentration flows exiting the above ground facility sites (consistent with MS4 requirements) so that the capacities of the existing downstream drainage facilities are not exceeded. These design features could include bio-retention, sand infiltration, return of stormwater for treatment within the treatment plant, and/or detention facilities.</p>	<p>Implementing Agency</p>
<p>UTIL-2 For future Replenish Big Bear Program projects that do not have access to electrical or natural gas connections in the immediate vicinity (defined here as a 1,000-foot buffer from a given project site), and will require either extension of infrastructure or creation of new infrastructure to meet electricity needs at a future Replenish Big Bear Program facility site, subsequent CEQA documentation shall be prepared that fully analyzes the impacts that would result from extension or development of electrical infrastructure.</p>	<p>Implementing Agency</p>
<p>UTIL-3 For future Replenish Big Bear Program projects that do not have access to telecommunication connections in the immediate vicinity (defined here as a 1,000-foot buffer from a given project site), and will require either extension of infrastructure or creation of new infrastructure to meet telecommunication needs at a future Replenish Big Bear Program facility site, subsequent CEQA documentation shall be prepared that fully analyzes the impacts that would result from extension or development of electrical or natural gas infrastructure.</p>	<p>Implementing Agency</p>
<p>UTIL-4 The contract with demolition and construction contractors for a given Replenish Big Bear Program project shall include the requirement that all materials that can feasibly be recycled shall be salvaged and recycled. This includes but is not limited to wood, metals, concrete, road base, soil and asphalt. The contractors for a given Replenish Big Bear Program project shall submit a recycling plan to the implementing agency for review and approval prior to issuance of permits for the construction of demolition/construction activities.</p>	<p>Implementing Agency</p>
<p>UTIL-5 The contract with demolition and construction contractors for a given Replenish Big Bear Program project shall include the requirement that all soils that are planned to be exported from the site that can be recycled shall be recycled for re-use; alternatively, soils shall be reused on site to balance soil import/export.</p>	<p>Implementing Agency</p>

Impact Description	Impact After Mitigation
<p>UTILITIES AND SERVICE SYSTEMS</p> <p>Subchapter 4.20 concluded that implementation of the Program could significantly impact stormwater drainage, energy, natural gas telecommunications, or solid waste as a result of requiring the construction or extension of such utilities as a result of development of the Program. This is because the proposed Program may be developed within sites that would require extension of or that may impact existing utility service systems. The topic of water and wastewater infrastructure were also discussed in Subchapter 4.20. The extension of water and wastewater related infrastructure was determined to be significant under the Program. The Program would contribute to the provision of sufficient wastewater treatment capacity at</p>	<p>Subchapter 4.20 concluded that implementation of the Program would not significantly impact stormwater drainage, energy, natural gas telecommunications, or solid waste. Additionally, mitigation is required to minimize impacts related to stormwater through implementation of a drainage plan to reduce downstream flows for future Program projects. Mitigation is required to address potential impacts related to solid waste including those that would ensure that construction and demolition materials that are salvageable are recycled, and thereby diverted from the local landfill, which will minimize the potential for Program projects to generate waste in excess of local landfill capacities; and ensure that soils that would generally be exported from a given construction site are salvaged where possible for</p>

Impact Description	Impact After Mitigation
<p>BBARWA's WWTP, as the Program is not anticipated to require an increase in overall capacity at the WWTP. Furthermore, as described under Hydrology and Water Quality, the action towards addressing groundwater supply challenges, given the Big Bear Valley's remote location, that would be addressed by the Program would ensure sufficient supply in the Big Bear Valley. The proposed Program would result in significant and unavoidable impacts under utilities and service systems, which pertains only to the reduction in discharge of undisinfected secondary effluent to the LV Site.</p>	<p>recycling and ultimately reuse, thereby diverting this waste stream from the local landfill. The construction of infrastructure related to energy and natural gas was analyzed and determined to be less than significant with the implementation of mitigation. This mitigation would ensure that Program projects not located in an area containing adjacent access to electricity and natural gas infrastructure would require subsequent CEQA documentation. With implementation of this mitigation the proposed Program will not cause unavoidable significant adverse impacts to energy or natural gas. The construction of infrastructure related to telecommunications was determined to be less than significant with the implementation of mitigation. This mitigation would ensure that Program projects not located in an area containing adjacent access to telecommunication infrastructure would require subsequent CEQA documentation. With implementation of this mitigation the proposed Program will not cause unavoidable significant adverse impacts to telecommunications.</p> <p>Based on the facts and findings presented in the DPEIR analysis, the proposed Program will not cause unavoidable significant adverse impacts to stormwater drainage, energy, natural gas, telecommunications, or solid waste.</p> <p>The topic of water and wastewater infrastructure were also discussed in Subchapter 4.20. As determined in the preceding evaluation, the proposed Program would result in significant and unavoidable impacts under utilities and service systems, which pertains both to the Big Bear Valley and to the reduction in discharge of undisinfected secondary effluent to the LV Site. As described in Subchapter 4.5, Biological Resources, the construction of the proposed water and wastewater facilities associated with the Program is anticipated to cause a significant biological resources impact if the Baldwin Lake Pipeline Alignment Option is the selected Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option. This is because construction of the Baldwin Lake Pipeline Alignment Option may affect bird-foot checkerbloom, as it is present within the proposed Program Area footprint for this pipeline alignment. While MMs BIO-1 through BIO-4 would minimize impacts to bird-foot checkerbloom from construction of the Solar Evaporation Ponds to a level of less than significant, MM BIO-5 would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. If BBARWA does not select the Baldwin Lake Pipeline Alignment Option, a significant impact under this issue would be avoided. Regardless, as the Baldwin Lake Pipeline Alignment Option may be the selected Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option, impacts under this issue are considered significant and unavoidable. Therefore, the construction of the proposed water and wastewater facilities associated with the Program is anticipated to cause a significant biological resources impact.</p> <p>The proposed Program would result in significant and unavoidable impacts under utilities and service systems, which pertains only to the reduction in discharge of undisinfected secondary effluent to the LV Site. The Big Bear Valley components of the proposed Program, which includes discharging purified water to Big Bear Lake via Stanfield Marsh and to Shay Pond, in addition to utilizing Big Bear Lake water to provide groundwater recharge in Sand Canyon, have been determined to be less than significant</p>

Impact Description	Impact After Mitigation
	<p>with the implementation of mitigation for all utilities and service systems issues.</p> <p>No mitigation is available to reduce the potential for a significant and unavoidable impact to occur to water supplies in the Lucerne Valley Basin as a result of Program Implementation. This is because the Program would reduce the amount of water that would be discharged to the Lucerne Valley Basin, which has a potential to impact the amount of water that could be expected to be recharged to the Lucerne Valley Basin on an annual basis, thereby impacting water supplies. Therefore, the proposed Program would have a significant and unavoidable potential for the implementation of the Program to substantially impair the availability of water supplies in the Lucerne Valley Basin as a result in the reduction in recharge to the Lucerne Valley Basin.</p>

Environmental Category /Avoidance, Minimization and Mitigation Measures	Responsible Agency
<p>WILDFIRE</p> <p>WF-1 Prior to initiating construction of proposed Conveyance Pipelines or other Program facilities within public ROW, BBARWA or the implementing agency shall prepare and implement a traffic control plan that contains comprehensive strategies for maintaining emergency access during construction. Strategies shall include, but are not limited to, maintaining steel trench plates at the construction sites to restore access across open trenches, flag persons and related assets to manage the flow of traffic, and identification of alternate routing around construction zones, where necessary. In addition, police, fire, and other emergency service providers (local agencies, Caltrans, and other service providers) shall be notified of the timing, location, and duration of the construction activities and the location of detours and lane closures. The implementing agency shall ensure that the traffic control plan and other construction activities are consistent with the San Bernardino County Operational Area Emergency Response Plan, and are reviewed and approved by the local agency with authority over construction within the public ROW.</p>	<p>Implementing Agency</p>
<p>WF-2 Prior to construction of facilities located in areas designated as High or Very High FHSZs by CAL FIRE, fire hazard reduction measures shall be incorporated into a fire management plan/fuel modification plan for the proposed facility, and shall be implemented during construction and over the long-term for protection of the site. These measures shall address all staging areas, welding areas, or areas slated for development that are planned to use spark-producing equipment. These areas shall be cleared of dried vegetation or other material that could ignite. Any construction equipment that can include a spark arrestor shall be equipped with a spark arrestor in good working order. During the construction of the project facilities, all vehicles and crews working at the project site shall have access to functional fire extinguishers and related fire prevention equipment (such as emergency sand bags, etc.) at all times. In addition, construction crews shall have a spotter during welding activities to look out for potentially dangerous situations, including accidental sparks. This plan shall be reviewed by the implementing agency and provided to CAL FIRE for review and comment, where appropriate, and approved prior to construction within high and very high FHSZs and implemented once approved. The fire management plan shall also include sufficient defensible space or other measures at a facility site located in a high or very high FHSZ to minimize fire exposure and damage to a level acceptable to the implementing agency over the long-term.</p>	<p>Implementing Agency</p>

Impact Description	Impact After Mitigation
<p>WILDFIRE</p> <p>The location of Program facilities would likely be located in designated high and very high FHSZs, and therefore, it is possible that one or more future facilities could be required to locate within such areas.</p>	<p>The analysis of wildfire issues in Subchapter 4.21 impacts from implementing the Program are less than significant with mitigation incorporated. Mitigation was identified to minimize impacts to wildfire that would: reduce the Program's potential traffic conflicts that could be exacerbating in high fire hazard zones by requiring all construction activities to be conducted in accordance with an approved construction traffic control plan; and, ensure fire hazard reduction measures are incorporated into a fire management plan/fuel modification plan for the proposed facility. Thus, with implementation of mitigation to minimize wildfire impacts, the Program would</p>

Impact Description	Impact After Mitigation
	not cause significant unavoidable adverse impacts under wildfire.

1.6 ALTERNATIVES

The CEQA and the State CEQA Guidelines require an evaluation of alternatives to the proposed action. Section 15126 of the State CEQA Guidelines indicates that the “discussion of alternatives shall focus on alternatives capable of eliminating any significant adverse environmental effects or reducing them to a level of not significant...” The State CEQA Guidelines also states that “a range of reasonable alternatives to the project which could feasibly attain the basic objectives of the project” and “The range of alternatives required in an EIR is governed by ‘rule of reason’ that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice.” The detailed analyses of the alternatives evaluated are provided in **Chapter 5** of this DPEIR. This evaluation addresses those alternatives for feasibility and a range of alternatives required to permit decision-makers a reasoned choice between the alternatives. Refer to **Table 1.6-1** for a tabular comparison of alternatives (found at end of this section).

The goal of the Program Team is to partner to recover a sustainable water resource that is currently being transported out of Big Bear Valley to Lucerne Valley, close the water loop, and keep the water in Big Bear Valley for beneficial reuse. In this instance, the DPEIR analysis in **Chapter 4** has reached a finding that there are four unavoidable significant adverse effects from implementing the Program as proposed in **Chapter 3**, the Program Description: ***Agriculture and Forestry Resources, Biological Resources, Hydrology and Water Quality, and Utilities and Service Systems.***

1.6.1 No Program Alternative

One of the alternatives that must be evaluated in an EIR is the “No Program Alternative (NPA),” regardless of whether it is a feasible alternative to the proposed Program, i.e., would meet the project objectives or requirements. Under this alternative, the environmental impacts that would occur if the proposed Program is not approved and implemented are identified. The NPA is required under CEQA to evaluate the environmental effects associated with no action on the part of the Lead Agency. The NPA would not require any upgrades to the BBARWA WWTP and the secondary effluent would continue to be discharged outside of Big Bear Valley for crop irrigation at the LV Site. The NPA would not provide any benefits to the Big Bear Valley. This alternative evaluates the environmental impacts resulting from a hypothetical continuation of the existing land use and circumstances. The NPA would not result in the Program Team securing a reliable, renewable source of water that could be retained in Big Bear Valley, which would essentially provide security for the future during potential droughts and dry years.

1.6.2 Groundwater Recharge at Greenspot Alternative

The Greenspot Alternative was developed as part of the Bear Valley Water Sustainability Project Recycled Water Facilities Planning Study (**Appendix 20**) prepared by WSC in December of 2016. The Greenspot Alternative analyzes the impacts from a scenario in which the Greenspot Alternative utilizes the similar AWPf upgrades at the BBARWA WWTP as identified under the Program to send blended tertiary and advanced treated water to the Greenspot Recharge Site (**Figure 5-1**). Because the Greenspot Alternative would not discharge to Big Bear Lake, both

tertiary and advanced treatment systems would be utilized. It is assumed that 22% of the recharge water would receive tertiary treatment, and 78% would receive advanced treatment.

Analysis of previous drilling and pilot recharge testing at the Greenspot Recharge Site resulted in the following conclusions:

- The Greenspot Recharge Site is located on recent alluvial deposits of permeable sand and gravel and no soil layers were observed beneath the site that would inhibit the downward percolation of recharge water to the ground water table.
- Groundwater levels start at approximately 100 ft below ground surface (bgs), which allows adequate space for mounding and storage of recharge water.
- A one-month pilot recharge test resulted in recharge rates of 3.1 to 3.7 ft/day. For planning purposes, the recharge rate is assumed to be one half of the observed rate to be conservative.
- At the seepage velocities estimated from the artificial recharge test data, ground water recharged at the GreenSpot Recharge Site would reach the nearest production wells (BBLDWP's Lakewood well field) in 8.5 to 17.5 months.
- No fatal flaws were identified during the pilot recharge test.
- The property necessary to support a full-scale program at this site would include more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access.

In a subsequent study, a calibrated groundwater flow model was used to simulate and evaluate a full-scale artificial recharge spreading basin facility at this site. The study evaluated potential changes in groundwater levels that would result from the artificial recharge of 500, 1,000, 1,500 or 2,000 AFY of water, with and without additional groundwater pumping. The study concluded that:

- An additional extraction well field downgradient of the recharge site would be needed to effectively intercept the water that is artificially recharged at the Greenspot Recharge Site. The study assumed six extraction wells at a rate of 100 gpm each.
- Groundwater levels can be maintained below approximately 30 ft bgs with as much as 1,000 AFY of artificial recharge during periods of below normal precipitation, provided that an equivalent amount of water is extracted at the down gradient well field.
- During wet periods, further pumping from the extraction well field and Lakewood Wells is required to artificially lower the ground water levels to maintain storage space within the aquifer in order to continue artificial recharge.
- California Department of Water Resources (DWR) records suggest that some existing private wells are located in the vicinity of the proposed recharge basins and would be within six -months travel time from the proposed basins. However, the exact locations of these wells would have to be verified.

Thus, the Bear Valley Water Sustainability Project Recycled Water Facilities Planning Study anticipated that the recharge capacity at the Greenspot Recharge Site would be 1,000 AFY.

It was assumed that, at a general level, the Greenspot Alternative would require the following infrastructure components to achieve recharge of 1,000 AFY of blended tertiary and advanced treated water:

- 6 extraction wells with a 100 gpm capacity at each well.
- 2 monitoring wells.
- Upgrades to the BBARWA WWTP, to include 1.0 MGD of full advanced treatment, producing up to 1,000 AFY of blended tertiary and advanced treated water. The secondary

effluent from the existing WWTP would be fed to the advanced treatment process train consisting of:

- Microfiltration/ultrafiltration (MF/UF).
- Reverse Osmosis (RO).
- Ultraviolet Advanced Oxidation (UV/AOP).
- Brine Disposal.
- Approximately 16,200 LF of 12-in pipeline.
- 2 MW Solar Array.
- The Greenspot Recharge Site was assumed to be a seven -acre site to allow more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access.
- Solar evaporation ponds (A brine minimization process would be used to reduce the volume of concentrate. The reduced concentrate would then be conveyed to new, lined Solar Evaporation Ponds on the LV Site).

The location of the facilities required for the Greenspot Alternative are shown in **Figure 5-1**.

1.6.3 Groundwater Recharge at Greenspot and Sand Canyon Alternative

The Groundwater Recharge at Greenspot and Sand Canyon Alternative (Greenspot & Sand Canyon Alternative) was developed as part of the Bear Valley Water Sustainability Project Recycled Water Facilities Planning Study (**Appendix 20**) prepared by WSC in December of 2016. The Greenspot & Sand Canyon Alternative analyzes the impacts from a scenario in which the Greenspot & Sand Canyon Alternative utilizes the similar AWPf upgrades at the BBARWA WWTP as identified under the Program to send blended tertiary and advanced treated water to both the Greenspot Recharge Site and Sand Canyon Recharge Area (**Figure 5-2**). Because the Greenspot & Sand Canyon Alternative would not discharge to Big Bear Lake, both tertiary and advanced treatment systems would be utilized. It is assumed that 22% of the recharge water would receive tertiary treatment, and 78% would receive advanced treatment.

The considerations for the feasibility of groundwater recharge at the Greenspot Recharge Site are detailed under **Subsection 5.4**, under the Greenspot Alternative. The feasibility of recharge at the Sand Canyon Recharge Area has been detailed in **Chapter 3, Program Description**, as this option is considered under the Program. The Bear Valley Water Sustainability Project Recycled Water Facilities Planning Study anticipated that the recharge capacity at the Greenspot Recharge Site would be 1,000 AFY, and that the recharge capacity at the Sand Canyon Recharge Area would be 750 AFY. Given that further study of the Sand Canyon Recharge Project has been analyzed in **Appendix 4**, the 2017 Sand Canyon Recharge Evaluation prepared by Thomas Harder & Co., and that Thomas Harder & Co. found that the recharge potential at the Sand Canyon Recharge Area is approximately 380 AFY over a six -month period, based on a recharge area of approximately 4.2 acres and a recharge rate of 2.1 ft/day, this alternative assumes that the Sand Canyon Recharge Area potential is approximately 380 AFY. Thus, the Greenspot & Sand Canyon Alternative assumes that up to 1,380 AFY could be recharged to the Bear Valley Basin for reuse, and that the upgraded portion of the BBARWA WWTP would be capable of handling at least 1.38 MGD, thereby producing the requisite 1,380 AFY of blended tertiary and advanced treated water.

It is assumed that, at a general level, the Greenspot & Sand Canyon Alternative would require the following infrastructure components:

- 6 extraction wells with a 100 gpm capacity at each well.

- 4 monitoring wells.
- Upgrades to the BBARWA WWTP, to include 1.38 MGD of full advanced treatment, producing up to 1,380 AFY of blended tertiary and advanced treated water. The secondary effluent from the existing WWTP would be fed to the advanced treatment process train consisting of:
 - Microfiltration/ultrafiltration (MF/UF).
 - Reverse Osmosis (RO).
 - Ultraviolet Advanced Oxidation (UV/AOP).
 - Brine Disposal.
- Approximately 50,200 LF of 12-in pipeline (approximately 16,200 LF to Greenspot and 34,000 LF to Sand Canyon).
- 2 MW Solar Array.
- The Greenspot Recharge Site is assumed to be a seven -acre site to allow more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access.
- The Sand Canyon Recharge Area is assumed to be the same as that which has been incorporated as part of the proposed Program.
- Solar evaporation ponds (A brine minimization process would be used to reduce the volume of concentrate. The reduced concentrate would then be conveyed to new, lined Solar Evaporation Ponds on the LV Site).

The location of the facilities required for the Greenspot & Sand Canyon Alternative are shown in **Figure 5-2**.

1.6.4 Discussion

While the NPA would reduce impacts related to Agriculture and Forestry Resources and Biological Resources, it would not avoid significant Hydrology and Water Quality or Utilities and Service Systems impacts. Additionally, there are a number of goals and policies pertaining to water resources in the San Bernardino Countywide Plan and Big Bear Lake General Plan that the NPA may conflict with through lack of action to manage water supplies in Big Bear Valley.

As such, given that the NPA would conflict with the Bear Valley Basin GSP, San Bernardino Countywide Plan and Big Bear Lake General Plan, a significant Land Use and Planning impact would result from the NPA. Further, although the NPA would reduce potentially significant impacts identified in this DPEIR as compared to the proposed Program, it would lead to greater impacts on Big Bear Valley, and the Bear Valley Basin in some other areas, including Hydrology and Water Quality and Utilities and Service Systems. In the final analysis, the NPA cannot be considered the environmentally superior alternative to the proposed Program from a total environment standpoint, because the environmental damage from not implementing the Proposed Program is forecasted to cause new significant adverse impacts when compared to implementing the Program.

As with the NPA, the Greenspot Alternative has comparable environmental impacts for all of the resource issues to the Program, except for those related to biological resources. Of the significant impacts that would result from the proposed Program, the only impact category that the Greenspot Alternative would eliminate is the Biological Resources impact. This is because this alternative would eliminate the Baldwin Lake Pipeline Alignment Option, thereby preventing impacts to the bird-foot checkerbloom, should BBARWA select the Baldwin Lake Pipeline Alignment Option as the preferred Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option. While the

water supply and water quality impacts at the LV Site as a result of the Program would be reduced slightly due to a smaller volume AWPf at the BBARWA WWTP, thereby discharging a larger volume of water to the LV Site than is anticipated under the Program, it would still contribute to significant Agricultural and Forestry, Hydrology and Water Quality, and Utilities and Services Systems impacts. Furthermore, while the Greenspot Alternative would meet nearly all of the Program's objectives, it would not meet some of the BBARWA's basic objectives, which are to develop promote a thriving community through enhanced recreation and protecting diverse habitats in Big Bear Valley. This is because it would not include discharge to Stanfield Marsh or Big Bear Lake, thus failing to meet this project objective. However, as this is the only alternative that would reduce a significant and unavoidable impact without contributing to new significant and unavoidable impacts (as is the case for the NPA creating new Hydrology and Water Quality and Utilities and Service Systems impacts), it would be the environmentally superior alternative, when considered against the scenario in implementing the Program in which BBARWA selects the Baldwin Lake Pipeline Alignment Option, and thereby may result in significant and unavoidable impacts to impacts to the bird-foot checkerbloom.

The Greenspot & Sand Canyon Alternative is comparable to the Program in terms of environmental impacts, as all of the impacts related to this alternative are the same as those identified under the Program. Of the significant impacts that would result from the proposed Program, no significant impacts would be eliminated by the Greenspot & Sand Canyon Alternative, though the severity of the impact to the Lucerne Valley Basin would likely be reduced. The water supply and water quality impacts at the LV Site as a result of the Program would be reduced slightly due to a smaller volume AWPf at the BBARWA WWTP, thereby discharging a larger volume of water to the LV Site than is anticipated under the Program, it would still contribute to significant Agricultural and Forestry, Biological Resources, Hydrology and Water Quality, and Utilities and Services Systems impacts. Furthermore, while the Greenspot & Sand Canyon Alternative would meet nearly all of the Program's objectives, it would not meet some of the BBARWA's basic objectives, which is to develop and promote a thriving community through enhanced recreation and protecting diverse habitats in Big Bear Valley. The discharge to Big Bear Lake via Stanfield Marsh is paramount to enhancing the recreational opportunities outlined in the Program objectives, as the provision of additional water in Big Bear Lake is anticipated to enhance the setting within Big Bear Lake and Stanfield Marsh, making recreation therein more appealing to those living and visiting the area. Additionally, the provision of additional water within Big Bear Lake and Stanfield Marsh would benefit the habitat supported by these water bodies. Therefore, as the Greenspot & Sand Canyon Alternative would not include discharge to Stanfield Marsh or Big Bear Lake, thus failing to meet this project objective.

**Table 1.6-1
 TABULAR COMPARISON OF PROJECT, NO PROGRAM, GREENSPOT, AND
 GREENSPOT & SAND CANYON ALTERNATIVES**

	<i>Would the Program Result in Significant Adverse Impact?</i>	<i>Would the Alternative Result in Equal, Greater, or Less Impacts than the Program?</i>

 LS = less than significant without **MMs**

1.7 AREAS OF CONTROVERSY

The Big Bear Valley community has expressed only a few concerns related to the Program as it is proposed:

- The community has expressed concerns over projects that would impact natural habitat, especially in the instances in which a project would adversely impact sensitive species or critical habitat.
- The community has expressed concerns over projects in the Big Bear Valley that are costly, due to a perception that there is a lack of funds to support such projects, though often such projects are supported, at least partially, by grant funding from the State or Federal government.
- The community has expressed concerns over how brine would be managed from a Program such as the Program, and how brine storage in the Big Bear Valley might impact the underlying groundwater.
- The community has expressed concerns over odors associated with recycled water treatment.
- The community has expressed concerns over whether pharmaceuticals can be filtered out of the Program Water.

The Lucerne Valley Economic Development Agency (LVEDA) and Mojave Water Agency (MWA) have expressed the following concerns:

- The LVEDA and MWA expressed concerns over the reduction in discharge to BBARWA's LV Site, and the impacts to the underlying groundwater basin (Lucerne Valley Basin), including groundwater quality, that may occur as a result of Program implementation.
- The LVEDA expressed concerns over the implications and changes that may occur at the LV Site as a result of Program implementation.

CHAPTER 2 – INTRODUCTION

2.1 BACKGROUND

2.1.1 Environmental Setting

The Big Bear Valley is located in the San Bernardino Mountains of San Bernardino County, California. The area includes approximately 135 square miles within a 12-mile-long valley surrounded by mountain ridges and rugged slopes. Land surface elevations range from 6,000 to 9,900 feet (ft) and the area is entirely surrounded by the San Bernardino National Forest. Big Bear Lake lies within Big Bear Valley and has a surface area of approximately 10 square miles and 23 miles of shoreline and is connected to Stanfield Marsh. Big Bear Valley is home to approximately 23,000 full time residents. The area is primarily residential with some commercial uses, and experiences an influx of part-time population and vacationers enjoying the seasonal recreational facilities within Big Bear Valley. In recent years, the population of Big Bear Valley can swing on a given day from the base population listed above, to more than four times the number of persons as a result of tourism drawing people to Big Bear Valley⁵ to the recreational nature of Big Bear Valley economies, occupancy within Big Bear Valley fluctuates seasonally, typically peaking in July and at the lowest level during the winter.

To provide background context on the community that the Program would support, the California Communities Environmental Health Screening Tool: CalEnviroScreen 4.0 indicates that the Big Bear Valley experiences a low pollution burden, but all of the developed areas of Big Bear Valley experience higher than average poverty rates due to the percentage of people living below twice the poverty level. The areas with the greatest poverty levels in Big Bear Valley are the central portion of the City of Big Bear Lake, the community of Sugarloaf, the western portion of the City of Big Bear Lake, and the community of Big Bear City respectively.

Natural precipitation provides the sole source of water supply for Big Bear Valley, and is relied on for potable groundwater supplies, replenishing Big Bear Lake, and supporting the rare and diverse habitat and species in Big Bear Valley. Drought conditions and a long-term decline in precipitation trends have led the local water management agencies to investigate opportunities for supplemental water supplies, which are extremely limited due to its isolated location at the top of the watershed. Currently, wastewater generated within Big Bear Valley undergoes preliminary and secondary treatment and is discharged outside of the watershed to irrigate alfalfa fields in the Lucerne Valley, located approximately 20 miles north of Big Bear Valley.

2.1.2 CEQA Process Background

The Program Team—which includes BBARWA, BBCCSD, BBLDWP, and BBMWD, has developed the Replenish Big Bear Program with the goal of retaining Program Water within Big Bear Valley for beneficial use. By doing so, this will provide a ~~supplemental and drought proof~~ new source of water for current and future Big Bear Valley residents and businesses. The Replenish Big Bear Program (Program) incorporates and leverages prior recycled water planning efforts in the region and represents opportunities in the context of current and prospective future regulations.

⁵ BBLDWP 2020 Urban Water Management Plan

Based on the findings of the Notice of Preparation (NOP), BBARWA concluded that a Program Environmental Impact Report (PEIR) should be prepared to address the potential impacts from the proposed Program. However, project-level detail is provided throughout the analysis in this PEIR for all Program facilities, except for the Sand Canyon Monitoring Wells, which have been analyzed on a more general level given that the specific locations for the monitoring wells have not yet been determined, though the general locations of the wells are known to be downstream from the Sand Canyon Recharge Area (refer to **Figure 3-32**). The decision to prepare a DPEIR was based on the finding that the proposed Program may have one or more significant effects on the existing environment and surrounding environment as is documented in the NOP, provided as **Subchapter 8.1** of this document.

BBARWA has prepared the Replenish Big Bear Program DPEIR that evaluates the potential environmental impacts that would result from constructing and implementing the proposed Program.

2.2 PURPOSE AND USE OF AN EIR

CEQA was adopted to assist with the goal of maintaining the quality of the environment for the people of the State. Compliance with CEQA, and its implementing guidelines, requires that an agency making a decision on a project (defined as an action that can change the physical environment) must consider its potential environmental effects/impacts before granting any approvals or entitlements. Further, the State adopted a policy "that public agencies should not approve projects as proposed if there are feasible alternatives or feasible **MMs** available which would substantially lessen the significant environmental effects of such projects." Thus, an agency, in this case BBARWA, must examine feasible alternatives and identify feasible **MMs** as part of the environmental review process. CEQA also states "that in the event specific economic, social, or other conditions make infeasible such project alternatives or such **MMs**, individual projects may be approved in spite of one or more significant effects thereof." (§21002, California Public Resources Code)

When applied to a specific project, such as the proposed Program, BBARWA is required to identify the potential environmental impacts of implementing the project; and, where potential significant impacts are identified, BBARWA must determine whether there are feasible **MMs** or alternatives that can be implemented to avoid or substantially lessen significant environmental effects of a project. The first step in this process, determination that an EIR is required and issuance of a NOP, has been completed for the Program. Completion of the first step constitutes the "project being considered for approval and implementation" by BBARWA. Based on the information in the NOP, BBARWA concluded an EIR should be prepared to address any potential significant impacts that may result from implementation of the proposed Program.

The following environmental issues will be analyzed in this DPEIR: aesthetics, agricultural and timberland resources, air quality, biological resources, cultural resources, energy, geology and soils, greenhouse gas, hazards and hazardous materials, hydrology and water quality, land use and planning, mineral resources, noise, population and housing, public services, recreation, transportation and traffic, tribal cultural systems, utilities and service systems, and wildfire.

BBARWA prepared and circulated a NOP for the Program. The NOP public review period through the State Clearinghouse began on November 30, 2022 and ended on January 17, 2023. The Program Team felt that an extended 45-day NOP Comment Period, in addition to holding two Scoping Meetings, would enable adequate time for public participation and understanding of the

Program at hand. Respondents were requested to send their input as to the scope and content of environmental information and issues that should be addressed in the Program no later than 45 days after receipt of the NOP. The NOP was distributed to interested agencies, the State Clearinghouse (SCH# 2022110595), and a list of interested parties compiled by BBARWA. As previously stated, BBARWA held two Scoping Meetings—one on each end of Big Bear Valley. The first was held at BBLDWP (41972 Garstin Drive, Big Bear Lake, CA 92315) on January 5, 2023 at 6:00 PM and the second was held at BBARWA (121 Palomino Drive, Big Bear City, CA 92314) on January 10, 2023 at 6:00 PM (the NOP and Scoping Meeting Information are provided in **Subchapter 8.1** of this DPEIR).

The date and location of the Scoping Meetings were announced in the NOP, and although not required, a legal advertisement announcing the Scoping Meetings was published in a newspaper of general circulation prior to the Scoping Meeting. BBARWA received 14 written comments in response to the NOP. A copy of each letter and a summary of the Scoping Meeting comments is provided in **Subchapter 8.2**. Additionally, a brief response to each issue raised in the NOP and Scoping Meeting comments that has been organized by environmental topic is provided in **Subchapter 8.2**.

The Replenish Big Bear Program DPEIR was prepared in order to address all of the issues identified in the NOP and to provide information intended for use by BBARWA and the agencies that make up the Program Team, in addition to interested and responsible agencies and parties, and the general public in evaluating the potential environmental effects of implementing the proposed Program.

CEQA requires that BBARWA consider the environmental information in the Program record, including this DPEIR, prior to making a decision on the proposed Program. BBARWA must consider and decide to approve or reject the Program as proposed and described in Chapter 3, Program Description of this DPEIR. BBARWA also has the authority to modify the Program based on input provided during the public review process.

Because BBARWA determined that it would conduct a DPEIR, issues raised in the comment letters did not alter the scope of the document to include any issue areas that were not already intended to be included. This DPEIR was prepared in order to address the all of the issue areas identified in Appendix G of the State CEQA Guidelines; this provides an informational document intended for use by BBARWA and the agencies that make up the Program Team, interested and responsible agencies and parties, and the general public in evaluating the potential environmental effects of implementing the Program.

CEQA requires that BBARWA, the CEQA Lead Agency, consider the environmental information in the Program record, including this DPEIR, prior to making a decision on the proposed Program. The decision that will be considered by BBARWA is whether to approve the Program for implementation, or to reject the proposed Program.

As stated above, BBARWA will serve as the CEQA Lead Agency pursuant to the State CEQA Guidelines Section 15051(b)(1). The Replenish Big Bear Program DPEIR was prepared by TDA for the Program Team of BBARWA, BBCCSD, BBLDWP, and BBMWD. TDA was retained to assist the BBARWA and the Program Team to conduct the independent review of the Program required by CEQA before the DPEIR is released. BBARWA has reviewed the content of the DPEIR and concurs in the conclusions and findings contained herein.

2.3 SCOPE AND CONTENT OF THIS EIR

As stated previously, this DPEIR evaluates the environmental effects of the proposed Program based on Appendix G of the State CEQA Guidelines as follows: aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology/soils, greenhouse gas emissions/climate change, hazards and hazardous materials, hydrology/water quality, land use/planning, mineral resources, noise, population/housing, public services, recreation, transportation, tribal cultural resources, utilities/service systems, and wildfire.

Based on data and analysis provided in this DPEIR, it is concluded the proposed Program could result in significant adverse environmental impacts to the following environmental issues: ***Agriculture and Forestry Resources, Biological Resources, Hydrology and Water Quality, and Utilities and Service Systems***. All other potential impacts were determined to be less than significant without mitigation or can be reduced to a less than significant level with implementation of the **MMs** identified in this DPEIR.

In addition to evaluating the environmental issues listed above, this DPEIR contains all of the sections mandated by CEQA and the State CEQA Guidelines. **Table 2.3-1** provides a listing of the contents required in an EIR along with a reference to the chapter and page number where these issues can be reviewed in this document. This DPEIR consists of two volumes. Volume 1 contains the CEQA mandated sections and some pertinent appendices. Volume 2 contains the technical appendices.

**Table 2.3-1
 REQUIRED EIR CONTENTS**

Required Section (CEQA)	Section in EIR	Page Number
Table of Contents (Section 15122)	Same	Beginning ii
Summary (Section 15123)	Chapter 1	Beginning 1-1
Program Description (Section 15124)	Chapter 3	Beginning 3-1
Environmental Setting (Section 15125)	Chapter 4	Beginning 4-1
Significant Environmental Effects of Proposed Program, i.e., Environmental Impacts (Section 15126(a))	Chapter 4	Beginning 4-1
Unavoidable Significant Environmental Effects (Section 15126(b))	Chapter 4	Beginning 4-1
Mitigation Measures (Section 15126(e))	Chapter 4	Beginning 4-1
Cumulative Impacts (Section 15130)	Chapter 4	Beginning 4-1 and 6-2
Alternatives to the Proposed Action (Section 15126(f))	Chapter 5	Beginning 5-1
Growth-Inducing Impacts (Section 15126(d))	Chapter 6	Beginning 6-1
Irreversible Environmental Changes (Section 15126(c))	Chapter 6	6-1
Effects Found Not to be Significant (Section 15128)	Chapter 1	6-1
Organizations and Persons Consulted (Section 15129)	Chapter 7	Beginning 7-1
Appendices ⁶	Chapter 8	Beginning 8-1

⁶ Chapter 8 includes: **Subchapter 8.1:** NOP, **Subchapter 8.2:** NOP comment letters and responses to comments, **Subchapter 8.3:** Distribution List

2.4 DPEIR FORMAT AND ORGANIZATION

The Replenish Big Bear Program DPEIR eight chapters in Volume 1 and a set of technical appendices in Volume 2, which, when considered as a whole, provide the reviewer with an evaluation of the potential significant adverse environmental impacts from implementing the proposed Program. Note that Chapter 8 contains those materials referenced as essential appendices to the DPEIR, such as the NOP. Technical Appendices are provided in Volume 2 of the DPEIR, under separate cover. Appendix materials are referenced at appropriate locations in the text of this DPEIR.

The following paragraphs provide a summary of the content of each chapter of the DPEIR.

Chapter 1 contains the Executive Summary for the DPEIR. This includes an overview of the proposed Program and a tabular summary of the potential adverse impacts and **MMs**.

Chapter 2 provides the reviewer with an Introduction to the document. This chapter of the document describes the background of the proposed Program, its purpose, and its organization. The CEQA process to date, including the comments on the NOP and Scoping Meeting comments and responses thereof, is summarized and the scope of the DPEIR is identified.

Chapter 3 contains the Program Description used to forecast environmental impacts. This chapter describes for the reviewer how the existing environment will be altered by the proposed Program. Chapter 3 sets the stage for the environmental impact forecasts set out in the following chapter.

Chapter 4 presents environmental impact forecasts for each environmental issue identified in Section 2.3 of this DPEIR. Chapter 4 sets out for the reviewer an impact evaluation for each issue in the following manner: an introduction; the environmental setting; thresholds of significance; the potential impacts that may occur if the Program is implemented; proposed **MMs**; cumulative impacts; and significant and unavoidable impacts.

Chapter 5 contains the evaluation of range of alternatives to the proposed Program. Included in this section is an analysis of the mandatory NPA plus two additional alternatives.

Chapter 6 presents the topical issues that are required in an EIR. These include any significant irreversible environmental changes and any growth inducing effects of the proposed Program.

Chapter 7 describes the resources used in preparing this DPEIR, including persons and organizations contacted; list of preparers; and bibliography.

Chapter 8 contains those materials referenced as essential appendices to the DPEIR, such as the NOP, a summary of comments received at the scoping meeting, and responses to the NOP and scoping meeting comments.

Volume 2 contains the Technical Appendices under separate cover. Appendix materials are referenced at appropriate locations in the text of this DPEIR.

2.5 AVAILABILITY OF THE REPLENISH BIG BEAR PROGRAM DPEIR

This DPEIR is being distributed directly to all public agencies and interested persons identified in the NOP mailing list (see **Subchapter 8.1**), the State Clearinghouse, as well as any other

requesting agencies or individuals. All reviewers will be provided 45 days to review the DPEIR and submit comments to BBARWA for consideration and response. The DPEIR is also available for public review at the following web address: <https://www.replenishbigbear.com/documents> and at <https://www.bbarwa.org/ceqa-documents> and at the following location during the 45-day review period:

Big Bear Area Regional Wastewater Agency
 (Physical Address) 121 Palomino Drive,
 (Mailing Address) P.O. Box 517
 Big Bear City, CA 92314

2.6 REVIEW PROCESS

After receiving comments on the DPEIR, BBARWA will prepare a Final PEIR for certification prior to making a recommendation to the BBARWA Governing Board regarding approval of the Replenish Big Bear Program. Information concerning the Final PEIR public review schedule and BBARWA meetings for this Program can be obtained by contacting Ms. Bridgette Burton, BBARWA. Questions and comments submitted by mail or email shall be addressed to:

Big Bear Area Regional Wastewater Agency
 Attn: Bridgette Burton
 P.O. Box 517
 Big Bear City, CA 92314
 Email: bburton@bbarwa.org | Telephone: 909-584-4524

Implementation of future individual project(s) in accordance with the Replenish Big Bear Program may require a variety of approvals from other agencies. This section summarizes agency approvals that have been identified to date. This list may be expanded as the environmental review proceeds. Consequently, it should not be considered exhaustive. The potential participating agencies are arranged based on the individual topics contained in the standard CEQA Initial Study Environmental Checklist Form. **Table 2.6-1** outlines the other agency approvals that may be necessary to implement the proposed Program.

**Table 2.6-1
 OTHER AGENCY APPROVALS**

Agency	Approvals Necessary
<p>STATE & LOCAL AGENCIES: SWRCB</p>	<p>Notice of Intent (NOI) to the SWRCB) for a NPDES general construction stormwater discharge permit. This permit is granted by submittal of an NOI to the SWRCB, but is enforced through a Storm Water Pollution Prevention Plan (SWPPP) that identifies construction BMPs for the site. In Big Bear Valley, the Santa Ana Regional Board enforces the BMP requirements contained in the NPDES permit by ensuring construction activities adequately implement a SWPPP. Implementation of the SWPPP is carried out by the construction contractor under contract to BBARWA, BMWWD, BBLDWP, or BBCCSD, with the Regional Board providing enforcement oversight.</p>

Agency	Approvals Necessary
Jurisdictional Waters	The Program includes the potential discharge of fill into or alterations of “waters of the United States,” “waters of the State,” and stream beds of the State of California. Regulatory permits to allow fill and/or alteration activities due to Program activities such as pipeline installation are likely be required.
USACOE	<ul style="list-style-type: none"> • A Section 404 permit for the discharge of fill material into “waters of the United States” may be required from the USACOE.
Santa Ana Regional Board	<ul style="list-style-type: none"> • A Section 401 Water Quality Certification may be required from the Regional Board.
CDFW	<ul style="list-style-type: none"> • 1600 Streambed Alteration Agreement may be required from the CDFW.
USFWS CDFW	These agencies may need to be consulted regarding threatened and endangered species documented to occur within an area of potential impact for future individual projects. This could include consultations under the Fish and Wildlife Coordination Act.
San Bernardino County City of Big Bear Lake	Tree removal permits may be required from local jurisdictions; and, San Bernardino County and local jurisdictions must ensure that stormwater discharges from each of the facility sites meet the current MS4.
SCAQMD	Air quality permits may be required from the SCAQMD.
Caltrans San Bernardino County City of Big Bear Lake SBCFCD Bear Valley Electric Service, Inc. (BVES) Southwest Gas	Encroachment permits may be required.
CAL FIRE	CAL FIRE regulates the removal of clusters of trees pursuant to CAL FIRE timberland conversation regulations. The facilities proposed under this Program are anticipated to either require obtaining an exemption or must submit a TCP pursuant to California Public Resources Code 4621(a) and a THP pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.
Colorado Regional Board	The Colorado Regional Board will issue a modified WDR to BBARWA, as will the Santa Ana Regional Board will issue a WDR and WRR for use of recycled water.
Santa Ana Regional Board	The Santa Ana Regional Board will issue a WDR and WRR for use of recycled water.
California Department of Public Health	The California Department of Public Health must review and approve the future use of recycled water
SBCFCD City of Big Bear Lake FEMA	If any flood hazard areas are affected by the proposed Program, SBCFCD, the City of Big Bear Lake, and FEMA may perform reviews for this Program.
FEDERAL AGENCIES: BOR EPA	The proposed Program has been awarded a grant for the Program from the BOR. The proposed Program may seek grants or loan from other Federal agencies, such as the EPA.

No other reviewing or permitting agencies have been identified.

CHAPTER 3 – PROGRAM DESCRIPTION

3.1 INTRODUCTION

Together the following agencies—BBARWA, BBCCSD, BBLDWP, and BBMWD, henceforth referred to jointly as the Program Team—are proposing to implement the Replenish Big Bear Program (Program), previously known as the Bear Valley Water Sustainability Project. The Program includes upgrades and additions to BBARWA’s WWTP to produce Program Water through full advanced treatment to protect the receiving waters and their beneficial uses.

The agency leading the Program Team is BBARWA, who will take the position of Lead Agency for compliance with CEQA on behalf of this Program. The Program has been awarded Federal grants, so compliance with the National Environmental Protection Act (NEPA) is also needed. Therefore, this document has been prepared to meet NEPA standards to enable BOR and other Federal agencies to process this Program under a separate NEPA documentation process. NEPA compliance will also be carried forth by BBARWA as the Lead Agency, while BBCCSD, BBLDWP, and BBMWD would remain responsible agencies. The Program would upgrade BBARWA’s existing WWTP to an AWPf. The AWPf would produce purified water, henceforth referred to as “Program Water” that would be retained within the Big Bear Valley watershed to be used to increase the sustainability of local water supplies. In turn, the secondary effluent that is currently delivered to BBARWA’s LV Site will be reduced.

As detailed in this Program Description, many of the activities that make up the Program are in the planning and design phase. This DPEIR analysis focuses on both the plan level and project level implementation, including site-specific construction and operation details of individual program elements, where individual elements are known. As such, the level of information and analysis provided for each individual action is commensurate with this DPEIR approach.

3.2 PROGRAM LOCATION

The Big Bear Valley is located in the San Bernardino Mountains of San Bernardino County, California. The area includes approximately 135 square miles within a 12-mile-long valley surrounded by mountain ridges and rugged slopes. Land surface elevations range from 6,000 to 9,900 ft and the area is entirely surrounded by the San Bernardino National Forest. The proposed Program is located within the Big Bear Valley Groundwater Management Zone (GMZ or Bear Valley Basin). Big Bear Lake and Baldwin Lake are located in the middle of the Bear Valley Basin. The overall Program Area consists of Big Bear Valley. The BBARWA sewer service area and the Big Bear Valley potable water service areas are shown on **Figure 3-1** to illustrate the regional context of the proposed Program. The proposed elements of the Program that are located within the Big Bear Valley are shown on **Figures 3-2 through 3-17**, which depict the Program Area from a regional and site-specific level. The site-specific Figures depict areas in which new infrastructure is required in support of the Program and also depicts portions of the Program that will utilize existing infrastructure that will be required in support of Program operation.

The Program will span just east of Big Bear Lake to the WWTP at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the southeast to the Resort Storage Pond and Sand Canyon Recharge Area. Each of these elements are discussed in further detail below. The Program is located within several U.S. Geological Survey (USGS) 7.5-minute topographic maps, including the following: Big Bear City, CA; Big Bear Lake, CA Moonridge, CA; San Geronio, CA; and, Lucerne Valley, CA. The central point for this Program is the BBARWA WWTP, for which the geographic coordinates of the proposed Program are 34.268906, -116.815575, which is located in Section 7, Township 2 North, Range 2 East of the Big Bear City, CA USGS 7.5-minute topographic map.

3.3 PROGRAM PURPOSE AND OBJECTIVES

The goal of the Program Team is to partner to recover a water resource that is currently being transported out of the Big Bear Valley to Lucerne Valley, close the water loop, and keep the water in the Big Bear Valley for beneficial reuse. This goal will be achieved through development of a multi-benefit water reuse Program that:

- Augments natural recharge for water supply sustainability;
- Protects the rare and diverse habitat and species in the Big Bear Valley;
- Promotes a thriving community through enhanced recreation;
- Creates a new and sustainable water supply;
- Educates the community about the water cycle, recycled water treatment process, and water quality to gain public support;
- Creates a Program that benefits the Program Team, and thereby benefits the community served by the members of the Program Team;
- Develops a cost-effective Program to offset potable water demands; and

Furthermore, beyond the Program Objectives, the Program includes the following uses and benefits:

- Sustain Stanfield Marsh Habitat and Increase Educational Opportunities: By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained and educational opportunities for the community and visitors would be created;
- Enhance Big Bear Lake Benefits: The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- Expand Local Water Supplies: When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin. The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge;
- Sustain Unarmored Threespine Stickleback Fish with Program Water: To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with

a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater. While this part of the Program is included in this DPEIR for analysis purposes, this Program component is not anticipated to be completed in the near term. Therefore, a full analysis was not completed;⁷

3.3.1 Program Characteristics

The Program Team envisions the facilities described in this Section as a key element in the long-term sustainability of local water supplies for the whole of the Big Bear Valley. Drought conditions and a long-term decline in precipitation trends have led the local water management agencies to investigate opportunities for supplemental water supplies, which are extremely limited due to its isolated location at the top of the Santa Ana River watershed (**Figure 3-18**). As such, the Program has been designed to retain local water in the Big Bear Valley to increase the sustainability of water supplies. The following agencies within the Big Bear Valley have partnered to jointly fund and develop the Program; though the Lead Agency for this Program is BBARWA:

- BBARWA: provides wastewater treatment to the entire Valley (79,000 acres).
- BBCCSD: Services include water, wastewater collection, fire protection & emergency medical services, solid waste collection, and street lighting services. BBCCSD's water service area includes Big Bear City and portions of San Bernardino County. BBCCSD's wastewater collection area includes Big Bear City and portions of unincorporated communities such as Sugarloaf, Erwin Lake, Whispering Forest, and Moonridge.
- BBLDWP: Formed in 1989 with the purchase of the retail water system from Southern California Water Company and currently provides water service to the City of Big Bear Lake, located along the south side of Big Bear Lake, as well as the unincorporated communities of Fawnskin, Sugarloaf, Erwin Lake and Lake Williams.
- BBMWD: An independent special district that is responsible for the overall management of Big Bear Lake.

While this DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components, project-level detail is provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdles that would be necessary to modify the water source supporting the Stickleback. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level.

A visual overview of the whole of that which is proposed by this Program is shown on **Figure 3-29**.

BBARWA WWTP Upgrades Project

Replenish Big Bear includes permitting, design, and construction of AWPf at the existing BBARWA WWTP, about 6.59 miles of pipeline for product water and RO brine minimization, three pump stations, a groundwater recharge facility, and up to four monitoring wells. The Program is

⁷ The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (*Gasterosteus aculeatus williamsoni*), which is a Federally and state endangered species.

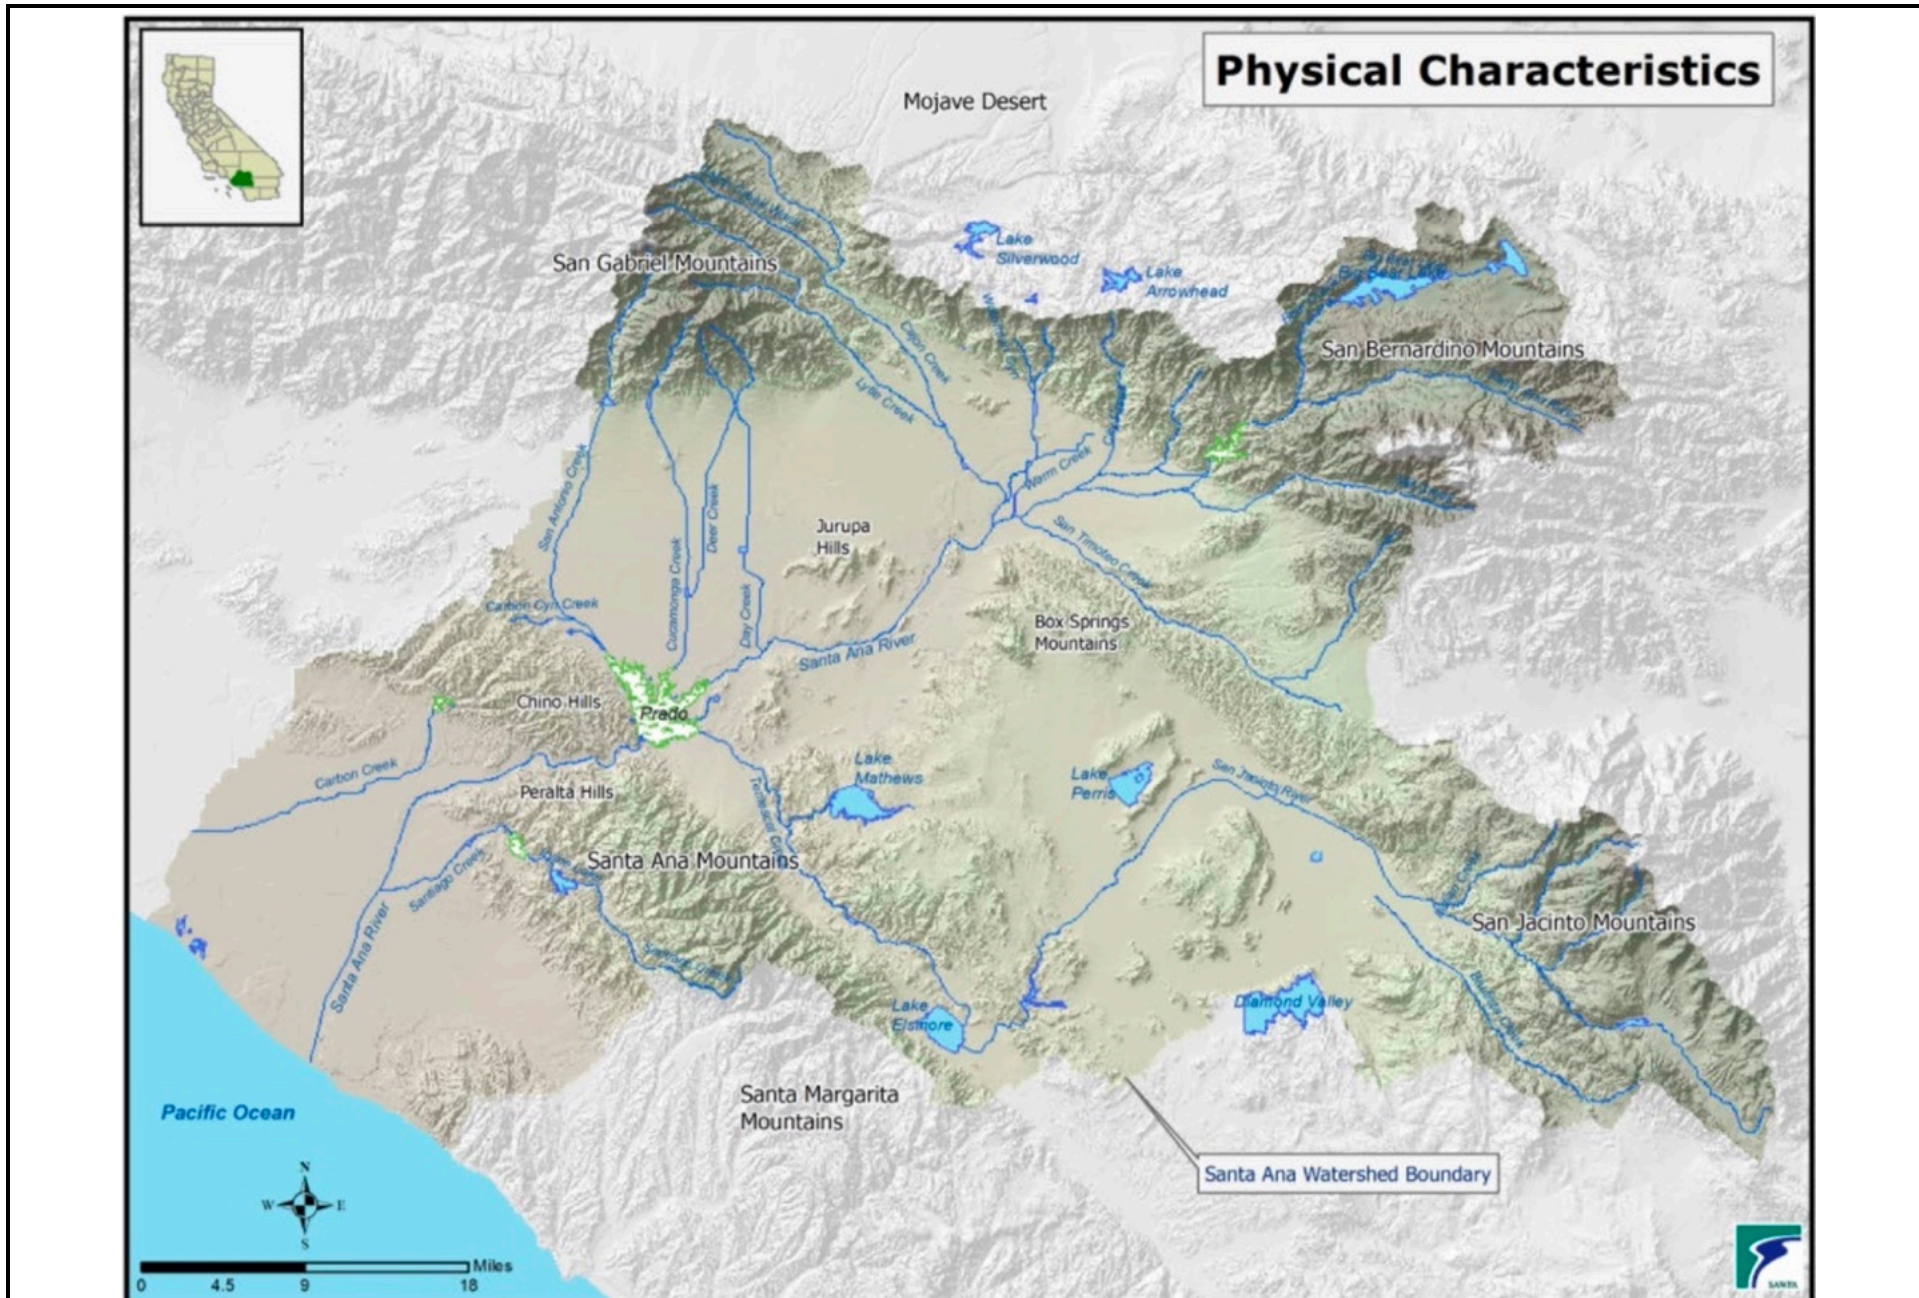

FIGURE 3-18

FIGURE 3-29

currently estimated to produce approximately 1,950 AFY of high-quality Program Water, and may produce up to 2,200 AFY by 2040 through operation of a high-recovery brine minimization technology. Piloting will be conducted to confirm the feasibility of the higher yield estimates. For the purposes of this document, 2,200 AFY is used to be conservative in evaluating environmental impacts. Between 2012-2022, the average amount of effluent BBARWA sent to the LV Site is about 2,190 AFY or about 2.0 MGD. With the implementation of Replenish Big Bear, BBARWA plans to only send water flows in excess of the 2.2 MGD treatment capacity to the LV Site. For redundancy purposes, BBARWA plans to maintain its current discharge location in Lucerne Valley, where undisinfectated secondary effluent is currently conveyed to irrigate fodder crops used for livestock feed.

The Program includes upgrades and additions to BBARWA's WWTP including an AWPf to produce purified water (i.e., Program Water) through full advanced treatment that would meet the stringent regulatory requirements for Big Bear Lake, particularly for nutrients (specifically TP, TIN and TDS). To achieve the anticipated effluent limits, BBARWA will need to implement a series of upgrades to existing unit processes and integrate new unit processes at its WWTP:

- Upgrade the existing oxidation ditches to increase biological nutrient removal process;
- Tertiary filtration and nutrient removal via denitrification filters;
- UF and RO membrane filtration;
- Brine pellet reactor for brine minimization; and
- UV/AOP.

The Program will require significant upgrades to the treatment process at the WWTP to meet stringent discharge requirements for the Big Bear Lake Discharge and the Sand Canyon Recharge.

A visual representation of the scope of the AWPf upgrades is shown on **Figures 3-23 and 3-24**.

Other improvements at BBARWA's WWTP includes the installation of 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building. A visual representation of the BBARWA WWTP Solar Array Project is shown on **Figure 3-37**.

Solar Evaporation Ponds Project

The Program Team is considering the use of solar evaporation pond(s), while all other methods of brine disposal have been ruled infeasible. Solar evaporation ponds rely on solar energy to evaporate water from the brine concentrate stream, leaving behind precipitated salts, which ultimately are disposed of in a landfill. Pond size requirements can be quite high depending on the brine flow and evaporation rates and the regulatory requirement for impervious liners of clay or synthetic membranes substantially increases the cost of construction. The preliminary RO brine management option for the Program is a brine minimization pellet reactor to reduce the volume of brine waste from the RO process. The reduced brine stream from the pellet reactor will be conveyed to Solar Evaporation Ponds located on BBARWA WWTP property. Using an RO recovery of 90% at 2.2 MGD influent flow would result in 0.22 MGD of RO brine to be minimized through the pellet reactor, and approximately 0.022 MGD of brine to be conveyed to the evaporation pond based on a pellet reactor recovery of 90%. A total evaporation pond area of 23 acres is needed for the brine stream. However, if the higher yield cannot be achieved up to a total evaporation pond area of 57 acres would be required. The expected useful life of the evaporation ponds is equal to or greater than the useful life of the AWPf.

Scope of Upgrades

FIGURE 3-23

Scope of Upgrades

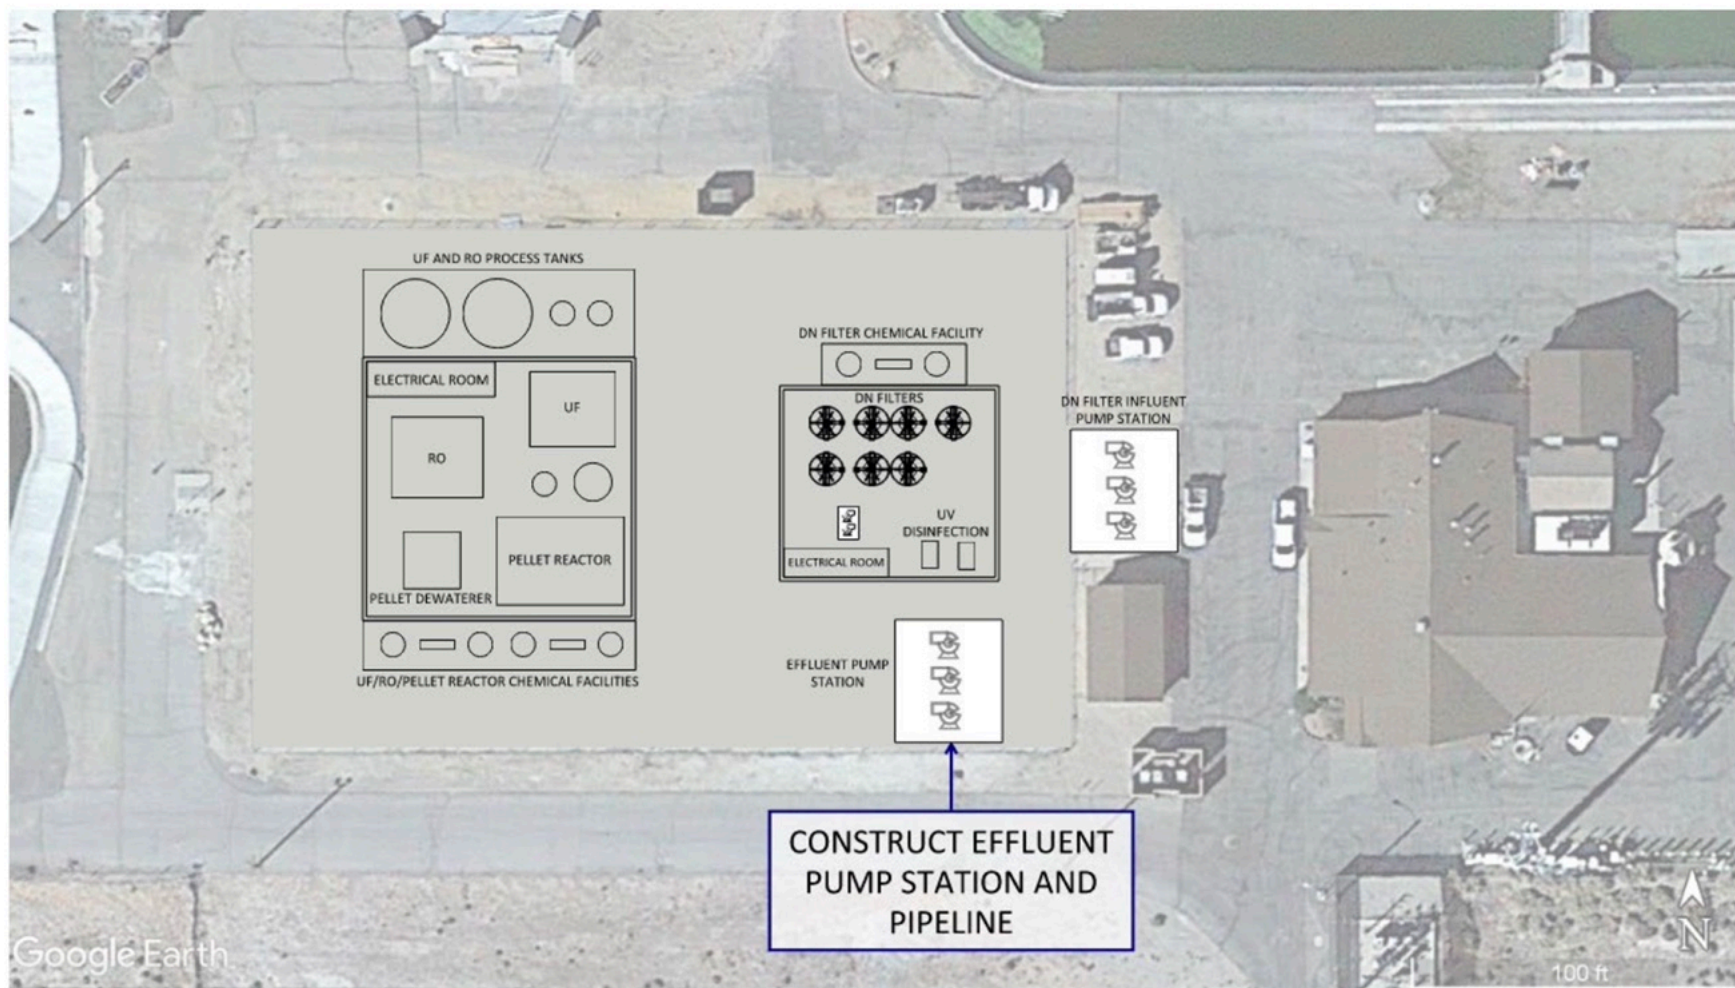

FIGURE 3-24

Replenish Big Bear Program

Possible Solar Locations

FIGURE 3-37

Additionally, up to two monitoring wells will be required to be installed to verify that seepage from the ponds is not contaminating underlying groundwater. A visual representation of the Solar Evaporation Ponds Project is shown on **Figure 3-26**.

Stanfield Marsh/Big Bear Lake Discharge Project

As part of the Program, up to 2,200 AFY of Program Water is proposed to be discharged to the east end of Stanfield Marsh, which will then flow into Big Bear Lake. Stanfield Marsh and Big Bear Lake are connected through a set of culverts under Stanfield Cutoff. The Stanfield Marsh/Big Bear Lake Discharge Project would require installation of up to 12" 19,940 LF, with the length of pipeline being determined based on the Alignment Option BBARWA ultimately selects. Each Alignment Option has been evaluated as part of this DPEIR. The Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options are shown on **Figure 1-10**, and listed below for reference:

Alignment Option 1 to Discharge Point 1

- Baldwin Lake Pipeline Alignment Option: this Alignment Option traverses through Baldwin Lake from the BBARWA WWTP site to connect with the Meadow Lake Pipeline Alignment Option.
- Meadow Lane Pipeline Alignment Option: this Alignment Option connects with the Baldwin Lake Alignment Option, traverses along South Paradise Way south to West Arbor Lane, along West Arbor Lane at South Paradise Way west to Sequoia Drive, along Sequoia Drive at West Arbor Lane south to West Meadow Lake, and along West Meadow Lane west to Discharge Point 1 at Stanfield Marsh.

Alignment Option 2 to Discharge Point 2

- East Neighborhoods Pipeline Alignment Option: this Alignment Option traverses south from the BBARWA WWTP site south along Palomino Drive to Shay Road, along Shay Road west to Barranca Boulevard, along Barranca Boulevard south/southwest to East Country Club Boulevard, along East Country Club Boulevard west to Bufflehead Drive, along Bufflehead Drive north to East Barker Boulevard, along East Barker Boulevard west to Teal Drive, along Teal Drive north to Mountain View Boulevard, along Mountain View Boulevard west to Shore Drive, along Shore Drive north to Elysian Boulevard, along Elysian Boulevard west to Pintail Drive, along Pintail Drive south to East Mountain View Boulevard, along East Mountain View Boulevard west to Eider Drive, along Eider Drive south to Angeles Boulevard, along and through Angeles Boulevard west to South Paradise Way. At Angeles Boulevard and South Paradise Way, this Alignment Option connects with the West Neighborhoods Pipeline Alignment Option.
- West Neighborhoods Pipeline Alignment Option: this alignment option traverses east from its connection with the East Neighborhoods Pipeline Alignment Option at Angeles Boulevard and South Paradise, and traverses west along East Angeles Boulevard to Mount Doble Drive, along Mount Doble Drive south to East Country Club Boulevard, along East Country Club Boulevard west to Big Tree Drive, along Big Tree Drive south to Valley Boulevard, along Valley Boulevard west to Bowles Drive, along Bowles Drive southwest to West Aeroplane Boulevard, along West Aeroplane Boulevard northwest and west to Division Drive, along Division Drive north to approximately Fairway Boulevard where the pipeline traverses west to Discharge Point 2 at Stanfield Marsh.

The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will

Scope of Upgrades

FIGURE 3-26

account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge.

Sand Canyon Recharge Project

As part of the Program, up to 380 AFY of Program Water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period.

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake and discharging it into Sand Canyon, which serves as a flood control channel (refer to **Figure 3-32**). The recharge operation would only occur during summer months when needed to supplement groundwater supply and would be operated intermittently as needed to avoid interference with flood flows. The operation would also be limited by availability of Program Water stored in Big Bear Lake, which would be tracked by BBMWD in accordance with the negotiated accounting framework that will be developed prior to implementation. The Program Team does not have rights to native water in Big Bear Lake and will only use Program Water for recharge.

No channel modifications to the channel bottom are anticipated since it is expected that the Program Water stored in Big Bear Lake will percolate within the defined Sand Canyon Recharge Area. If the Program Water does not fully percolate within the defined recharge area, the surface application discharge rate will be reduced using a VFD on the Sand Canyon Booster Station until the water does percolate within the defined recharge area. Recharge to Sand Canyon would occur through a discharge via a new pipe outlet at the top of the Sand Canyon Recharge Area at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. All of these concepts will need to be coordinated with SBCFCD to ensure that the capacity of the flood control channel remains sufficient to meet the primary purpose of providing flood protection. If these improvements resulted in a decrease in surface flow entering Big Bear Lake, the impact to surface water rights under the 1977 Judgment will be evaluated.⁸

When water is needed for recharge in Sand Canyon, it is assumed that the existing lake pump station owned by the Resorts could be used to transfer water through an existing pipeline into the existing storage pond located at Bear Mountain Ski Resort. Then the Program Water would be conveyed utilizing a new 471 gpm booster pump station at the existing storage pond located at the Bear Mountain Ski Resort via a new pipeline from Resort Storage Pond to Sand Canyon 8" 7,210 LF (refer to **Figures 3-30 and 3-31**). The existing lake pump station and storage pond located at Bear Mountain Ski Resort are used primarily for snowmaking in the winter and are expected to be available for the proposed recharge operation, which would only occur from April through October when the Resorts are not making snow. It is anticipated that a separate WDR permit by BBLDWP will be obtained to regulate the Sand Canyon Recharge Project.

⁸ The Big Bear Dam was originally constructed to provide water storage for Bear Valley Mountain which was formed in 1903 by the citrus growers of the Redlands/Highland area to ensure water supply for irrigation needs. The historic operation of the Big Bear Lake as an irrigation reservoir resulted in drastic fluctuations in lake levels, which conflicted with the goals of BBMWD and the community of Big Bear Valley. A legal conflict over the water rights and management of the lake was ultimately settled out of court through the 1977 Judgement. Under the terms of this judgement, BBMWD purchased the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Bear Valley Mutual. Bear Valley Mutual retained a storage right and ownership of all water inflow into Big Bear Lake.

Sand Canyon Underflow Analysis

Figure 3

FIGURE 3-32

The Program Water will be discharged at the top of the Sand Canyon Recharge Area. The discharge will consist of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. The channel slope will be protected from erosion using rip rap or similar erosion control methods.

Shay Pond Discharge Project

The Shay Pond Discharge Project would replace the potable water source that is currently discharged to the Shay Pond with Program Water as the new water source to maintain the water flow through the Pond. Up to 80 AFY of Program Water may be sent to Shay Pond to support the Stickleback, and any remaining Program Water will be sent to Stanfield Marsh, a tributary of Big Bear Lake. Based on the average volumes of discharges between 2012 and 2022, BBCCSD discharges approximately 50 AFY of potable water into Shay Pond to maintain the endangered Stickleback population. While this part of the Program is included in this DPEIR for analysis purposes, the Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (*Gasterosteus aculeatus williamsoni*), which is a Federally and state endangered species.

There is an existing 6-inch C-900 PVC pipeline that begins at the intersection of Shay Road and Palomino Drive and terminates near Shay Pond that can be used to convey the Program Water, with an extension of approximately 710 feet to reach Shay Pond. This nearby pipeline was constructed in 1986 for future use, but has never been put into service. It is possible that this pipeline may not be useable, and as such, a pipeline traversing this same alignment and sized comparably to the existing pipeline may be required, in addition to the proposed 710-foot extension to reach Shay Pond (new Shay Pond Conveyance Pipeline). The length of this pipeline would be 5,600 feet (Shay Pond Replacement Pipeline). A visual representation of the Shay Pond Discharge Project is shown on **Figure 3-34**.

LV Site Discharge Reduction

Between 2012 and 2022, the average amount of effluent BBARWA sent to the LV Site is about 2,190 AFY or about 2.0 MGD. With the implementation of the Program, BBARWA plans to only send water flows in excess of the 2.2 MGD treatment capacity to the LV Site. For redundancy purposes, BBARWA plans to maintain its current discharge location in Lucerne Valley, where undisinfected secondary effluent is currently conveyed to irrigate fodder crops used for livestock feed. However, the discharge to the LV Site would be reduced as a result of implementation of the Program. The reduction in flow to Lucerne Valley would be altered from about 2,190 AFY to about 340 AFY with the implementation of the proposed Program. A visual representation of the LV Site operations is shown on **Figures 3-35 and 3-36**.

3.4 PROGRAM BACKGROUND AND EXISTING CONDITIONS

3.4.1 Groundwater Management in Big Bear Valley

The Bear Valley Basin (Basin Number 8-009) was initially designated by DWR as a medium priority basin. Medium priority basins that are not in critical overdraft are scheduled to submit a GSP to DWR by January 31, 2022. DWR reclassified the Bear Valley Groundwater Basin (Bear Valley Basin) as a very low priority basin, but encouraged the BVBGSA to continue with the planned preparation of the GSP. Given the fact that natural precipitation is the only source of recharge and water supply to the Big Bear Valley, the BVBGSA member agencies have already been proactive in implementing many of the groundwater monitoring and management elements required by Sustainable Groundwater Management Act (SGMA) in an effort to protect this critical

FIGURE 3-34

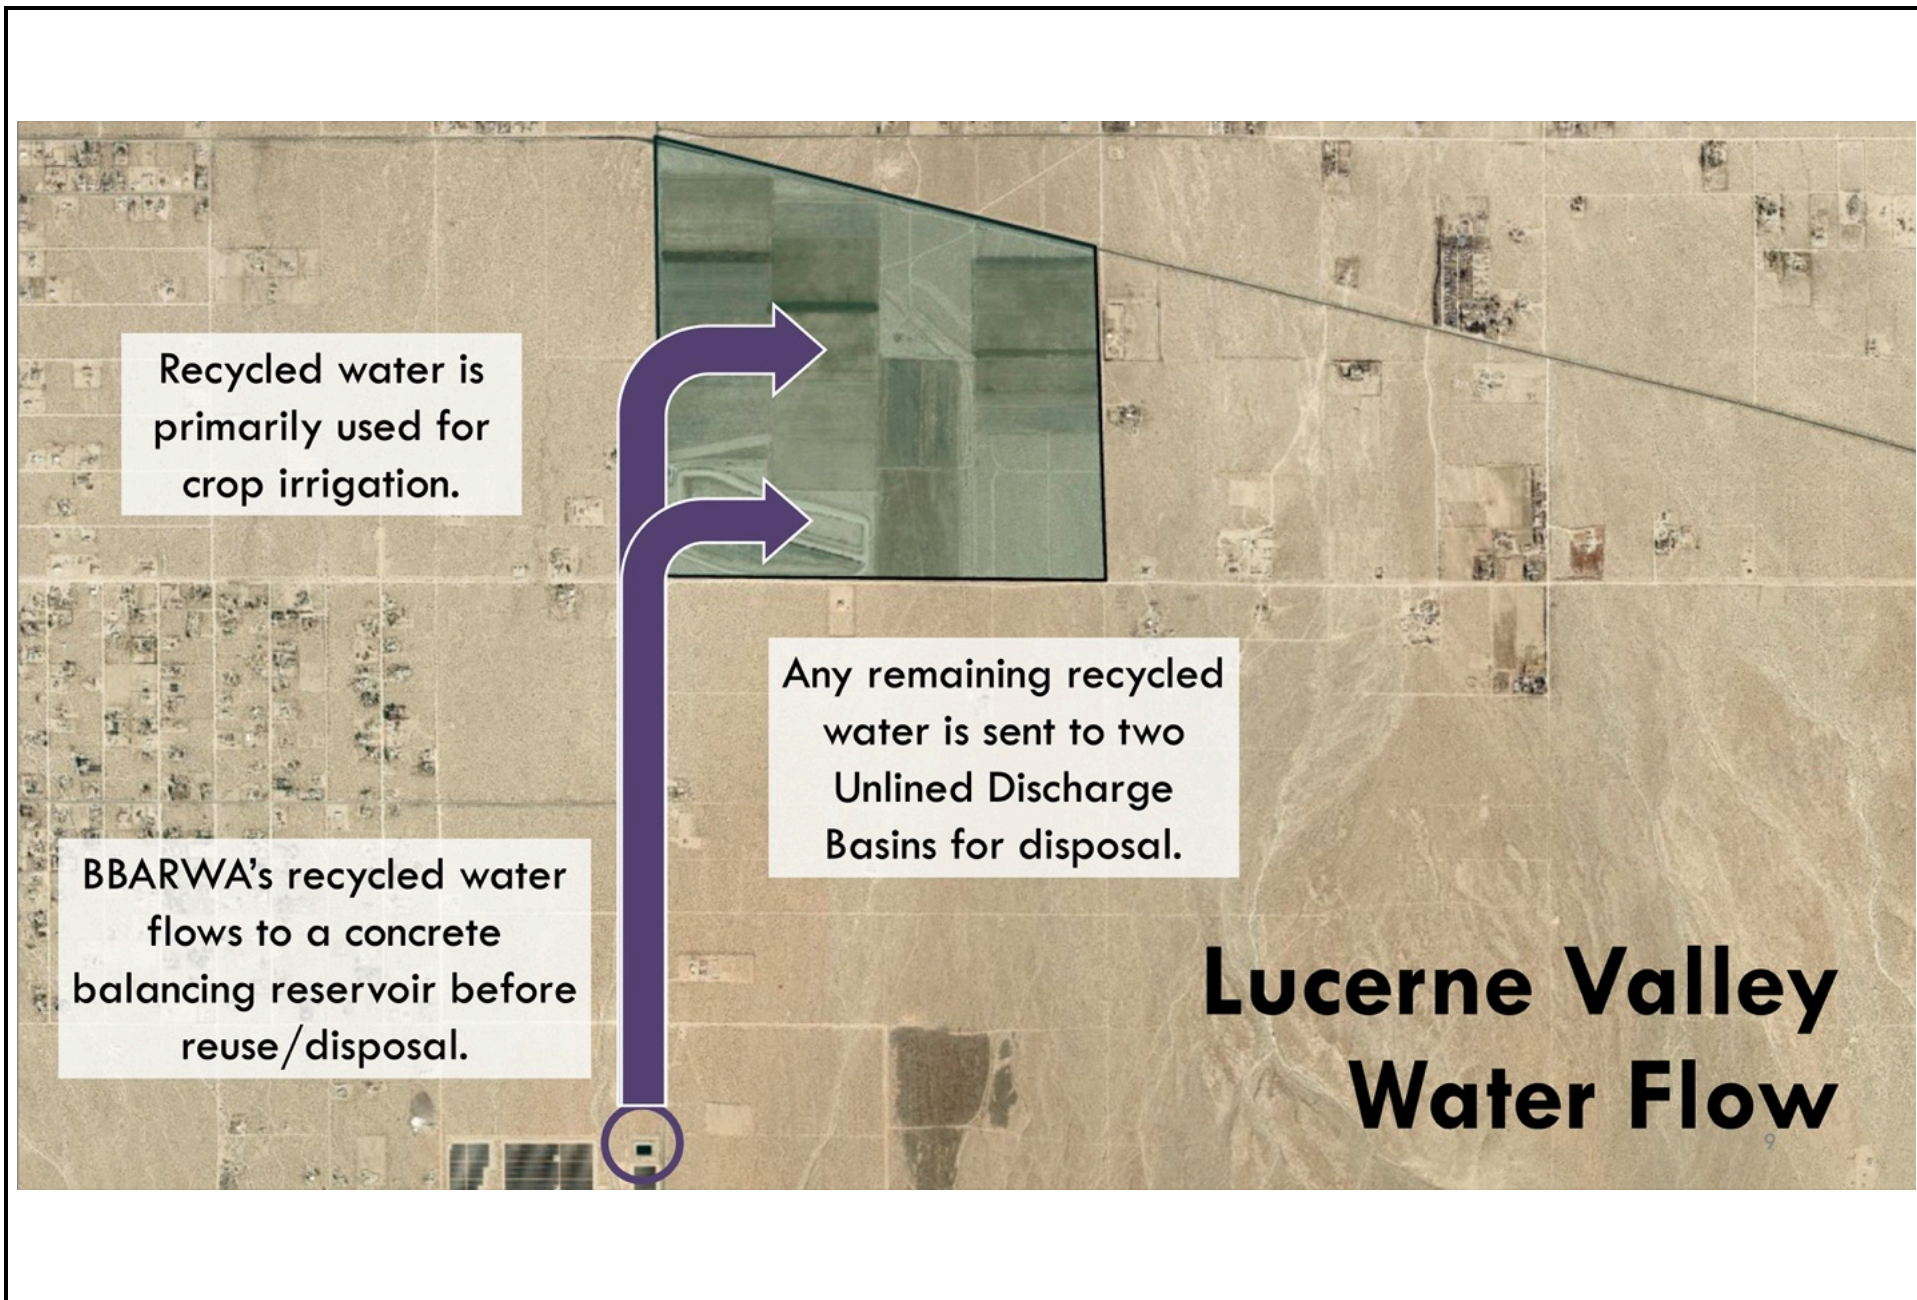

FIGURE 3-35

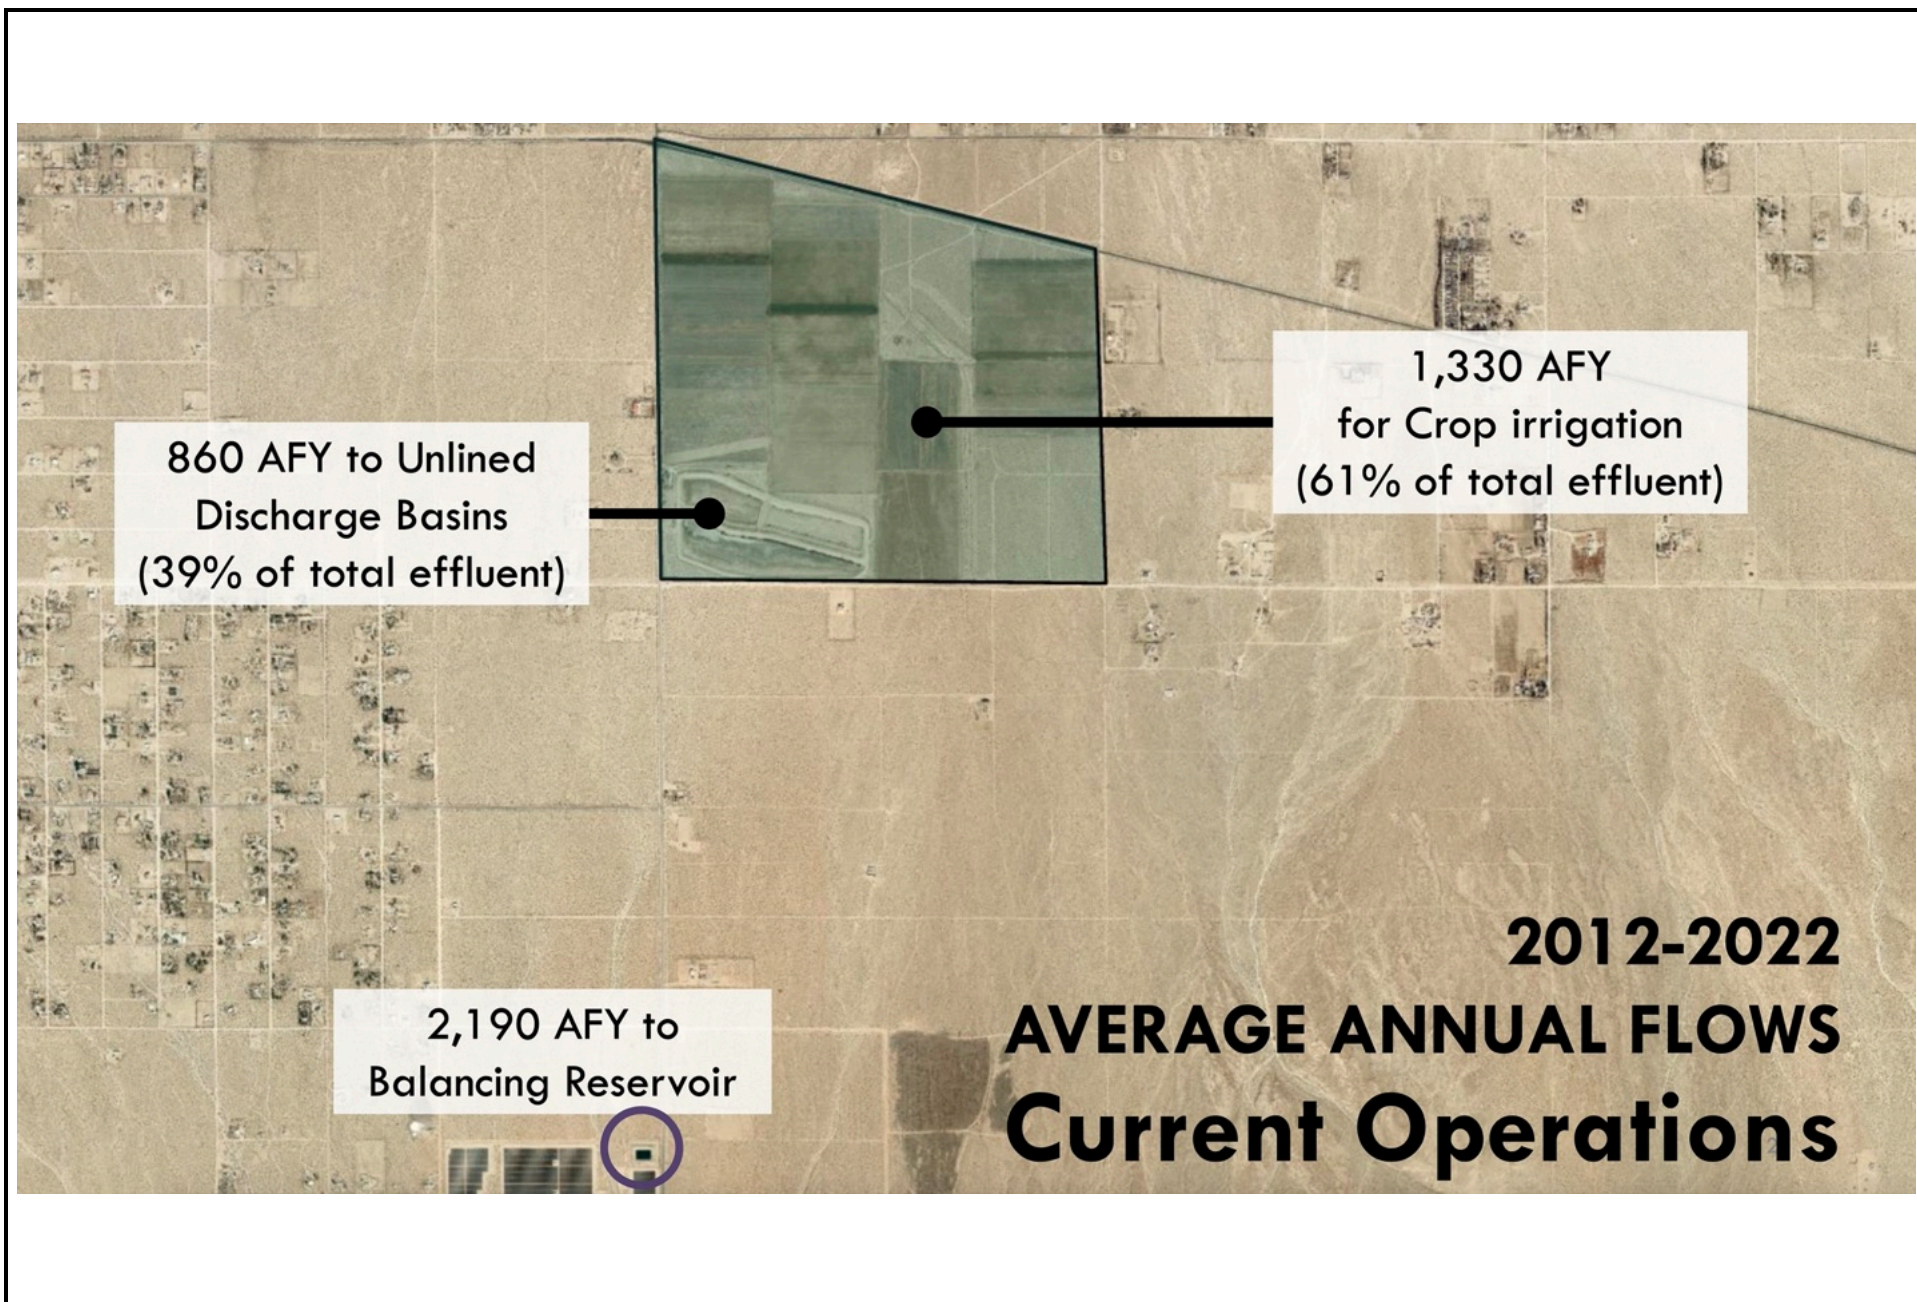

FIGURE 3-36

resource. Thus, the BVBGSA, a “local agency” comprised of BBCCSD, BBLDWP, BBARWA, and BBMWD, prepared the Bear Valley Basin GSP in January 2022. The GSP is available at <https://www.bvbgsa.org/>.

Groundwater pumping within the Bear Valley Basin, as a whole, has historically been within the Sustainable Yield resulting in relatively stable long-term groundwater levels. While there have periodically been localized groundwater level declines, pumping sustainability has been maintained through adaptive management of pumping distribution between management areas and implementation of conservation measures. To maintain pumping sustainability into the future, the BVBGSA plans to continue these effective management actions on a routine basis and implement projects as needed that support sustainable management. Additionally, groundwater level Measurable Objectives at each Representative Monitoring Site (RMS) are monitored against the average 2019 groundwater level at that site (refer to **Figure 3-20**). These management actions and monitoring programs are detailed further in the GSP.

3.4.2 Water Demand in Big Bear Valley

Water demands served by BBLDWP are primarily residential, which account for approximately 70 percent of BBLDWP's total demand, while commercial demands account for approximately 19 percent of BBLDWP's total demand. The remaining 11 percent is attributed to unbilled consumption and water loss. BBCCSD provides potable water to all its customers, which are comprised of about 88% residential and 12% commercial accounts. On average, BBCCSD's water uses are about 80% residential, 11% commercial, and 9% losses. The projected water demands for BBLDWP and BBCCSD area are presented in **Table 3-1**.

**Table 3-1
 WATER DEMAND PROJECTIONS FOR BEAR VALLEY WATER AGENCIES (AFY)**

Water Agency	2020	2025	2030	2035	2040	2045
BBLDWP	2,332	2,147	2,164	2,190	2,231	2,283
BBCCSD	1,067	1,185	1,206	1,227	1,249	1,271
Total	3,399	3,332	3,370	3,417	3,480	3,554

3.4.3 Big Bear Lake Water Management

Big Bear Lake is an important resource that provides extensive recreational, economic, ecological, and aesthetic benefits for the local community as well as the larger inland Southern California region. Stanfield Marsh and Big Bear Lake are connected through a set of culverts under Stanfield Cutoff. Together, Stanfield Marsh and Big Bear Lake have a surface area of nearly 3,000 acres, a storage capacity of 73,320 AF, and an average depth of 32 ft. Stanfield Marsh and Big Bear Lake are both Waters of the State of California and Waters of the U.S., which have several designated beneficial uses. For reference, **Table 3-2** shows the designated beneficial uses of Big Bear Lake and Stanfield Marsh per the 1995 Santa Ana River Basin Water Quality Control Plan (Santa Ana Basin Plan), as amended in 2008, 2011, 2016, and 2019. In addition, the Nutrient TMDL was adopted to address concerns with phosphorus and nitrogen impacts on Big Bear Lake. **Table 3-3** presents Big Bear Lake regulatory limits set to protect Big Bear Lake benefits.

 WQO = Water Quality Objectives

Big Bear Lake is located about 6,743 ft (2,055 m) above mean sea level (amsl) in the San Bernardino Mountains in San Bernardino County. Big Bear Lake was formed following construction of the Bear Valley Dam in 1883-1884 to serve as an irrigation supply for the citrus industry in the downstream Redlands-San Bernardino communities. Since that time, Big Bear Lake has served as a vital engine for economic growth in Big Bear Valley, and the region has developed into a year-round destination with extensive recreational and commercial activities, primary and secondary residences, vacation properties, hospitality, and other services.

As with all other natural and man-made lakes in Southern California, Big Bear Lake is subject to dramatic variability in water surface elevation; surface elevations reached as low as -48.5 ft relative to dam crest (72.33 ft maximum depth) in November 1961, corresponding to a volume of less than 1,000 AF and a lake surface area on the order of 200-300 acres during the extended drought in the late 1950's and early 1960's. BBMWD was subsequently formed in 1964 to manage and help stabilize the water level in Big Bear Lake. The region's natural hydrology includes severe

protracted droughts and is influenced by the Pacific Decadal Oscillation (PDO) and El Niño-La Niña climate systems, which makes lake level stabilization a tremendous challenge. This wide variability in Lake level, in turn, can have dramatic impacts on recreational, economic, and aesthetic values of Big Bear Lake, as well as ecological conditions and Big Bear Lake water quality.

The proposed Program would not only provide Program Water to serve existing uses, but it also envisions replenishing Big Bear Lake through Stanfield Marsh.

Big Bear Lake, as stated above, is managed by BBMWD, which has rights to the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Mutual. Mutual maintains a storage right and ownership of all water inflow into Big Bear Lake. Mutual has the right to request Lake releases commensurate with what may be reasonably necessary to meet the requirements of Mutual's stockholders, not exceeding 65,000 AF in any ten (10) year period.

BBMWD is able to maintain a higher water level in the lake by delivering water to Mutual from an alternate source of water. This alternate source of water (In-Lieu Water) comes mainly from the State Water Project (SWP) through a contract executed in 1996 with San Bernardino Valley Municipal Water District.

BBMWD's current Lake Release Policy was adopted in 2006 provides guidance on how Mutual demands will be met depending on Big Bear Lake level.

- When Big Bear Lake is in the top 4 feet, Mutual's demands will be met with Lake releases.
- When Big Bear Lake is between 4 and 6 feet below full, Lake releases will be made in the months of November through April and In-Lieu Water will be obtained from May to October.
- When Big Bear Lake is more than 6 feet below full, In-Lieu Water will be obtained.

Snowmaking Withdrawals

BBMWD currently has a contract with the Resorts, allowing the withdrawal of an allocated amount of water from Big Bear Lake to use for snowmaking purposes. Currently, the Resort is authorized to withdraw a maximum of 11,000 acre-feet (AF) of water from Big Bear Lake over a 10-year rolling period, not exceeding 1,300 AF in any single year. It is calculated that about half of the water withdrawn from Big Bear Lake for this purpose is returned as runoff.

Fish Protection Releases

In 1995, SWRCB issued Order No. 95-4, which requires BBMWD and Mutual to release water from Big Bear Lake for fishery protection in Bear Creek. Sufficient water must be released from Big Bear Lake to maintain specific flow standards, which vary by month and by hydrologic year type (normal, above normal or below normal precipitation).

3.4.4 Wastewater Characteristics and Facilities

BBARWA owns and operates a 4.89 MGD capacity WWTP located just south of Baldwin Lake on the east side of the Big Bear Valley. Between 2012-2022, the WWTP treated on average approximately 2.0 MGD of municipal wastewater collected from BBCCSD, the City of Big Bear Lake, and San Bernardino County Service Area (CSA) 53 in Fawnskin.

The existing treatment process includes the following:

- Preliminary treatment consisting of a mechanical coarse screen and an aerated grit chamber;

- Secondary treatment consisting of extended aeration oxidation ditches and secondary clarifiers; and
- Solids handling through a dewatering belt filter press.

Treated effluent is temporarily stored on-site prior to discharge to Lucerne Valley. Dewatered solids are hauled off-site.

The influent flows to BBARWA's WWTP are comprised of three components:

- Flow from full-time residential homes;
- Flows due to tourism, commercial activities and part-time residential homes; and
- Flows from Infiltration and Inflow (I/I) due to precipitation.

These components create a seasonal variation in the wastewater flows treated at the plant. BBARWA's 2010 Sewer Master Plan (2010 SMP) estimated that the full-time residential rate is 38% of the overall customer population within the area. The tourism season is largely concentrated in the months of December through April due to the Resorts; additionally, the months of June and July also see a slight rise in tourism due to Big Bear Lake recreation activities. The average daily flow is presently approximately 2.0 MGD and the maximum month flow is 5.4 MGD.

BBARWA's WWTP is located on a 93.5-acre property. The WWTP process components occupy 11.2 acres, and the remaining 82.3 acres include storage ponds and Solar Evaporation Ponds. Influent flows are conveyed through three BBARWA operated sewer mains and lift stations to the WWTP. The WWTP currently provides preliminary and secondary treatment.

Treated secondary effluent is discharged to BBARWA's 480-acre LV Site—about 20 miles north of the Big Bear Valley—for irrigation of fodder and fiber crops that are used as feed for livestock. The LV Site referred to herein is the 480-acre portion of the larger 630-acre BBARWA owned site in Lucerne Valley that is regulated by a Colorado Regional Board WDR, which stipulates that 340 acres of the LV Site can be irrigated with recycled water from BBARWA's WWTP, with an additional 140 acres available for irrigation utilizing other water sources. Use of recycled water for crop irrigation at the LV Site began in 1980 and 100% of the WWTP effluent is currently discharged to the LV Site. Discharge to the LV Site must meet the Colorado Regional Board WDR, which has an effluent limit for TDS of 550 mg/L over a 12-month period. A diagram of the Lucerne Valley Water Flow is provided as **Figure 3-35**, which shows that BBARWA's recycled water flows to a concrete balancing reservoir before reuse/disposal, and then is transferred to the LV Site where the recycled water is primarily used for crop irrigation, with any remaining recycled water sent to two unlined discharge basins for disposal. The 2012-2022 Average Annual Flows to the LV Site are shown on **Figure 3-36**, which indicates that the average flow to Lucerne Valley over this 10-year period was 2,190 AFY, with 860 AFY (39% of the total effluent) sent to the unlined discharge basins, and 1,330 AFY (61% of the total effluent) was utilized by the farmer for crop irrigation. It is estimated that 560 AFY of the 1,330 AFY utilized for crop irrigation was absorbed by the fodder crops, while about 20 AFY of the 860 AFY of effluent sent to the unlined discharge basins evapotranspired. Thus, for the purposes of this DPEIR, it is estimated that about 1,610 AFY of the effluent sent to the LV Site contributes to the recharge of the Lucerne Valley Basin.

3.4.5 Shay Pond and Stickleback Fish Habitat

The Stickleback is listed as both a Federal and State of California Endangered Species under the respective Endangered Species Acts. There has been a population of Stickleback in the Shay Creek area on the east side of Big Bear Valley, as shown in **Figure 3-21**, which includes Shay Pond, Sugarloaf Pond, Juniper Springs, Motorcycle Pond, Shay Creek, Wiebe Pond, and Baldwin Lake. By the summer of 1990, it was thought that the Stickleback remained in only Shay Pond; however, several years of above-average precipitation in the mid-1990s resulted in the establishment of a pool of water in Baldwin Lake.

There is a long history of study and group effort regarding the Stickleback in the Shay Creek area. The main stakeholders include USFWS, CDFW, the San Bernardino National Forest (SBNF), BBCCSD, BBLDWP, and BBARWA. The Shay Creek Working Group, which includes representatives from the USFWS, CDFW, SBNF, BBCCSD, BBLDWP, and BBARWA, was formed during the process of preparing the USFWS' 2002 Biological Opinion (2002 BO) for the area.

There are habitat threats that are specific to the Shay Creek area, including wetland vegetation growth and encroachment, pollution or eutrophication from contamination from horse manure, and loss of flow in the creek due to property development in the area. To mitigate wetland vegetation growth and encroachment, Shay Pond was dredged by BBCCSD in 2011, and again most recently in 2017. **Photos 3-1** and **3-2** show the pond before and after the 2011 dredging, respectively.

 ** Present only in Shay Pond.
 *** Additional work needed to determine if unarmored threespine sticklebacks.

FIGURE 3-21

Photo 3-2. Shay Pond After Dredging

Based on the average volumes of discharges between 2012 and 2020, BBCCSD discharges approximately 50 AFY of potable water into Shay Pond to meet the USFWS' 2002 BO requirement to maintain a minimum pond water level that supports suitable habitat conditions for the Stickleback. However, the proposed NPDES permit will permit up to 80 AFY of discharge. The objective of the Program is to maintain a minimum pond water level that will support suitable habitat conditions for the Stickleback. BBCCSD currently meets this requirement by discharging potable water into Shay Pond.

3.4.6 Lucerne Valley Site

The LV Site is the 480-acre site owned by BBARWA that is regulated by a Colorado Regional Board WDR. The LV Site is located near the intersection of Camp Rock Road and Highway 247 (Old Woman Springs Road) in Lucerne Valley, CA, as shown in **Figure 4.11-7**. This site is located approximately 17 miles north of BBARWA's WWTP.

The LV Site is surrounded by a barbed wire fence to restrict public access to the farm. Warning signs are clearly posted to inform the public that non-disinfected recycled water is used at this site.

The LV Site is regulated by a Colorado Regional Board WDR, which stipulates that 340 acres of the LV Site can be irrigated with recycled water from BBARWA's WWTP, with an additional 140 acres available for irrigation utilizing other water sources. The LV Site has been in operation as a farm since 1980 and is operated by a farmer who leases the land from BBARWA. Alfalfa and a grain mixture consisting of barley, oat, and wheat are grown onsite and sold as feed for animals, not producing milk for human consumption. Historically, up to 330 acres of the site had been farmed; however, the farmed area was reduced in 2012 to only 190 acres due to reduced water availability associated with drought conditions. The current farmed area remains at 190 acres, with no plans to increase the acreage.

3.5 PROJECTED USES OF RECYCLED WATER GENERATED BY THE PROGRAM

The following uses are anticipated as part of the Program and are discussed in more detail in subsequent sections.

- Continuous water supply to Stanfield Marsh, which will then flow into Big Bear Lake;
- Continuous water supply to Shay Pond for the Stickleback habitat, if and when implemented; and,
- Periodic groundwater recharge in Sand Canyon during summer months

3.5.1 Stanfield Marsh and Big Bear Lake Discharge – Program Overview

As part of the Program, up to 2,200 AFY of Program Water is proposed to be discharged to the east end of Stanfield Marsh, which will then flow into Big Bear Lake. Stanfield Marsh and Big Bear Lake are connected through a set of culverts under Stanfield Cutoff. Stanfield Marsh began a transformation in 1982 when BBMWD, working with CDFW, dredged basins, laid culvert pipes to connect to Big Bear Lake, and planted the shoreline, followed by numerous other enhancements in subsequent years.

Stanfield Marsh is now a scenic 145-acre wildlife preserve that includes a gazebo, walking paths, and two boardwalks that extend out into the marsh so that visitors can observe the wildlife in, under and around the water. Stanfield Marsh is home to rare and diverse species of birds, fish, amphibians, and mammals.

As previously stated, rainfall and snowmelt are the only sources of water for Stanfield Marsh, so the water level varies from season to season and throughout longer hydrologic cycles. During wet periods, Stanfield Marsh is a thriving wildlife preserve. During extended drought conditions, the water level recedes dramatically, the boardwalks extend over dry soil, and the wildlife become scarce. In the last 15 years, Stanfield Marsh has been less than half full nearly 40 percent of the time. Due to the recent rains in 2023, Stanfield Marsh is currently wet. Full advanced treated water would provide a new, ~~drought proof~~ source of inflow to the Lake and increase lake levels particularly particularly during extended droughts and stabilize the water levels and sustain habitat in Stanfield Marsh even during dry periods.

Water from Stanfield Marsh will also provide new inflow into Big Bear Lake and increase Lake levels relative to no Program conditions. The proposed outlets into Big Bear Lake at Stanfield Marsh would occur at one of two points just west of the Big Bear Airport, shown on **Figure 3-2**.

The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge.

Per conversations with DDW, Big Bear Lake may be designated as a non-restricted recycled water impoundment and the subsequent use of Program Water in Big Bear Lake would be subject to recycled water regulations. Additional coordination and studies are being conducted to regulate these uses. It is anticipated that a separate WDR permit will be obtained to regulate the Sand

Canyon Recharge Project. For possible non-potable recycled water uses for landscape irrigation, dust control, snowmaking, and nonrestricted impoundment, these uses would be regulated under the Statewide Water Reclamation Requirements for Recycled Water Use (Oder WQ 2016-0068-DDW).

In 2000, BBARWA was issued an NPDES permit (Santa Ana Regional Board Order No. 00-12), which included Stanfield Marsh and a proposed new Stickleback habitat in Baldwin Lake as authorized discharge points, subject to construction of tertiary treatment and disinfection upgrades. The NPDES permit limited discharges to Stanfield Marsh to periods of lower water levels when Stanfield Marsh was not hydraulically connected to Big Bear Lake. The tertiary treatment upgrades were not completed, and the discharge point was never used so the NPDES permit was not renewed when it expired in 2005. In 2005, the Santa Ana Regional Board issued Order No. R8-2005-0044, which does not allow discharge to Stanfield Marsh. A new NPDES permit, which BBARWA is in the process of acquiring, would be required for the Program to address discharges into Stanfield Marsh/Big Bear Lake.

3.5.2 Shay Pond Discharge Project – Program Overview

As part of the Program, up to 80 AFY of Program Water is proposed to be discharged to Shay Pond. The proposed Shay Pond Discharge is intended to replace potable water that is currently discharged to the pond to support the Stickleback, a State and Federal listed endangered species as stated under **Subsection 3.4.5**. The utilization of the Program Water for discharge to Shay Pond is currently being considered at a conceptual level by the Program Team since the implementation of this Program components is on hold due to the regulatory costs and h hurdles that would be necessary to modify the water source supporting the Stickleback.

There is a long history of study and group effort regarding the Stickleback in the Shay Creek area. While the objective is to maintain a minimum pond water level that will support suitable habitat conditions for the Stickleback, and BBCCSD currently meets this requirement by discharging potable water into Shay Pond, the 2002 BO also states that, should a suitable alternative supply of water be found to be appropriate for the stickleback in the future, BBCCSD may use an ‘in-lieu’ water supply, which could include the use of tertiary-treated water. The Shay Pond Discharge Project would provide an in-lieu water supply (i.e., purified water, which exceeds tertiary treated water) for Shay Pond to meet the requirements of the 2002 BO, which would enable BBCCSD to recover this potable supply to serve their customers.

3.5.3 Sand Canyon Recharge Project – Program Overview

As part of the Program, up to 380 AFY of Program Water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period. Groundwater recharge at Sand Canyon was evaluated by Thomas Harder & Co. to assess the feasibility of recharging the groundwater aquifer at Sand Canyon using surface water from Big Bear Lake and estimate the annual recharge capacity. This study can be found in the “Sand Canyon Recharge Evaluation” prepared by Thomas Harder & Co. dated November 29, 2017 (**Appendix 4, Volume 2 of this DPEIR**). Thomas Harder & Co. found that the recharge potential at Sand Canyon is approximately 380 AFY over a six -month period, based on a recharge area of approximately 4.2 acres and a recharge rate of 2.1 ft/day.

The Sand Canyon Recharge concept involves extracting Program Water stored in Big Bear Lake and discharging it into Sand Canyon, which serves as a flood control channel. The recharge operation would only occur during summer months when needed to supplement groundwater

supply and would be operated intermittently as needed to avoid interference with flood flows. The operation would also be limited by availability of Program Water stored in Big Bear Lake, which would be tracked by BBMWD in accordance with the negotiated accounting framework that will be developed prior to implementation. The Program Team does not have rights to native water in Big Bear Lake and will only use Program Water for recharge.

No channel modifications to the channel bottom are anticipated since it is expected that the Program Water stored in Big Bear Lake will percolate within the defined recharge area (as discussed below). If the Program Water does not fully percolate within the defined recharge area, the surface application discharge rate will be reduced using a VFD on the Sand Canyon Booster Station until the water does percolate within the defined recharge area. Recharge to Sand Canyon would occur through a discharge via a new pipe outlet at the top of the Sand Canyon Recharge Area at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. All of these concepts will need to be coordinated with SBCFCD to ensure that the capacity of the flood control channel remains sufficient to meet the primary purpose of providing flood protection. If these improvements resulted in a decrease in surface flow entering Big Bear Lake, the impact to surface water rights under the 1977 Judgment will be evaluated.⁹

When water is needed for recharge in Sand Canyon, it is assumed that the existing lake pump station owned by the Resorts could be used to transfer water through an existing pipeline into the existing storage pond located at Bear Mountain Ski Resort. These facilities are used primarily for snowmaking in the winter and are expected to be available for the proposed recharge operation, which would only occur from April through October when the Resorts are not making snow. It is anticipated that a separate WDR permit by BBLDWP will be obtained to regulate the Sand Canyon Recharge Project.

Surface Application Operations

The Program Water will be discharged at the top of the Sand Canyon Recharge Area shown in **Exhibit 3-1**. The discharge will consist of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. The channel slope will be protected from erosion using rip rap or similar erosion control methods, similar to that which is shown on **Exhibit 3-1** below.

⁹ The Big Bear Dam was originally constructed to provide water storage for Bear Valley Mountain which was formed in 1903 by the citrus growers of the Redlands/Highland area to ensure water supply for irrigation needs. The historic operation of the Big Bear Lake as an irrigation reservoir resulted in drastic fluctuations in lake levels, which conflicted with the goals of BBMWD and the community of Big Bear Valley. A legal conflict over the water rights and management of the lake was ultimately settled out of court through the 1977 Judgment. Under the terms of this judgement, BBMWD purchased the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Bear Valley Mutual. Bear Valley Mutual retained a storage right and ownership of all water inflow into Big Bear Lake.

Exhibit 3-1: EXAMPLE PIPE OUTLET EROSION CONTROL

The hatched area, in **Exhibit 3-2** below, along the Sand Canyon channel is where surface water can percolate and still meet the travel time required to the nearest downstream well. The Program Water stored in Big Bear Lake would have approximately 2,900 LF to percolate into the Bear Valley Basin. The Program Water is expected to fully percolate before reaching the end of the recharge area. If the Program Water does not fully percolate within the defined recharge area, the surface application discharge rate will be reduced using a VFD on the Sand Canyon Booster Station until the water does percolate within the defined recharge area. No channel modifications to the channel bottom are anticipated.

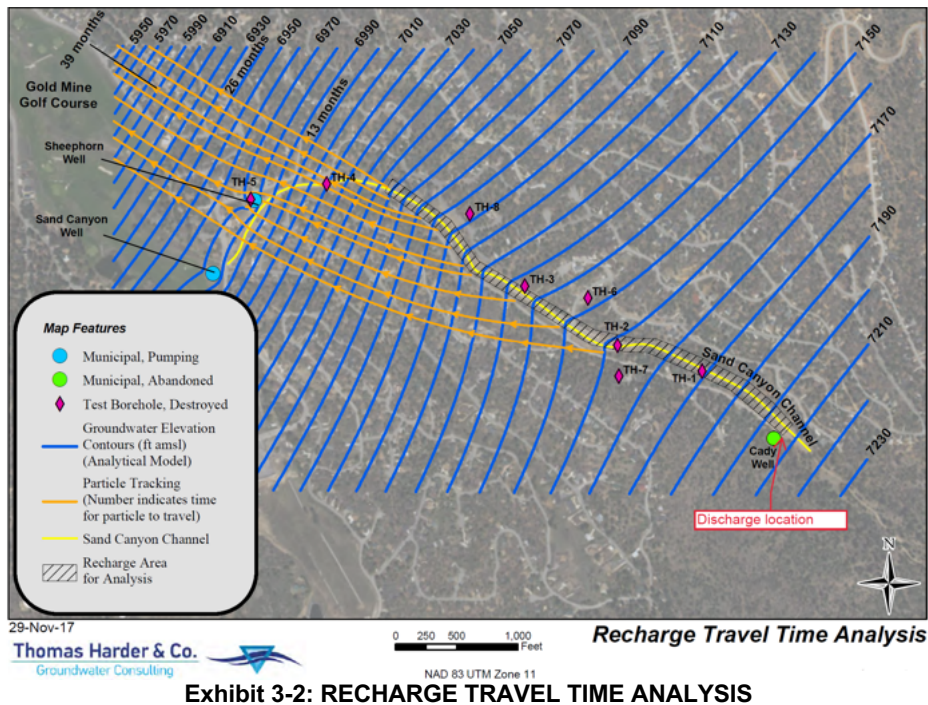

Exhibit 3-2: RECHARGE TRAVEL TIME ANALYSIS

Operations Plan

The objective of the Sand Canyon Recharge Project is to recharge the Bear Valley Basin. The Sand Canyon Recharge Project will utilize operation strategies to comply with the groundwater regulations and protect public health. Recharge will occur within the defined Sand Canyon

Recharge Area (refer to **Exhibit 3-2**, above). The recharge must occur when the channel is dry, and as such: recharge will not occur during periods where natural surface flows occur in the channel. Thus, it is anticipated that recharge will occur over an average six -month dry weather period (April-October), but as weather varies from year to year, the dry weather period shall dictate the timing of the recharge. Flows to the Sand Canyon Recharge Area will be reduced or stopped if Program Water does not fully percolate within the defined recharged area. Finally, BBLDWP will monitor the discharge and percolation performance as needed to comply with permit requirements for the Sand Canyon Recharge Project operation.

Groundwater Extraction

No new infrastructure is needed to extract the Sand Canyon Recharge water from the Bear Valley Basin. The Sand Canyon Recharge water will become potable groundwater and will be extracted using BBLDWP's existing potable wells located downstream of the recharge area. The wells are located at least six months of travel time from the recharge area, as required by groundwater recharge regulations.

Once pumped out by BBLDWP, the water will be distributed to BBLDWP customers through the existing water distribution system. A portion (approximately 1/3) of the water will be delivered to BBCCSD using existing interconnections between BBCCSD and BBLDWP that are intended for transferring water between the two agencies.

3.6 WASTEWATER TREATMENT UPGRADES

In order to meet the objectives of the Program, the BBARWA WWTP must be upgraded to meet the correlating water quality standards and objectives for the types of uses proposed as part of this Program. As such, the following section discusses the Santa Ana and Colorado Basin Plan water quality objectives, and the treatment upgrades required to treat wastewater to the degree required to comply with local, State, and Federal water quality regulations.

3.6.1 Basin Plan Water Quality Objectives

Santa Ana Basin Plan Objectives

In order to discharge Stanfield Marsh/Big Bear Lake, Shay Pond, and Sand Canyon Recharge Area, the treated effluent must meet the water quality objectives set by the Santa Ana Basin Plan because these locations are identified in this Basin Plan. The Santa Ana Basin Plan establishes beneficial uses and WQO for the ground and surface waters of the region and includes an implementation plan describing the actions by the Santa Ana Regional Board and others that are necessary to achieve and protect the water quality standards and beneficial uses. The Santa Ana Basin Plan establishes beneficial uses and WQOs for the ground and surface waters of the region and includes an implementation plan describing the actions by the RWQCB and others that are necessary to achieve and protect the water quality standards. The beneficial uses of Big Bear Lake and Stanfield Marsh are shown above in **Table 3-2**.

Per the Santa Ana Basin Plan, the Big Bear Valley beneficial uses are MUN and Industrial Process Supply (PROC). The Santa Ana Basin Plan provides a general narrative regarding the WQO for each water body type and specific numeric objectives for TDS, hardness, sodium, chloride, TIN, TP, sulfate, and chemical oxygen demand (COD). The objectives for the waters impacted by Program are summarized below and in **Table 3-4**.

**Table 3-4
 SUMMARY OF WATER QUALITY OBJECTIVES**

Water Quality Objective (WQO)	Shay Pond	Stanfield Marsh	Big Bear Lake	Big Bear Valley
Total Dissolved Solids (TDS), mg/L	Narrative Objectives	Narrative Objectives	175	300
Hardness, mg/L			125	225
Sodium, mg/L			20	20
Chloride, mg/L			10	10
Total Inorganic Nitrogen, mg/L			0.15	5
Sulfate, mg/L			10	20
Chemical Oxygen Demand, mg/L			--	--
Total Phosphorus, mg/L (TMDL Numeric Targets Objective)			0.035	--
Chlorophyll-a, mg/L (TMDL Numeric Targets Objective)			0.014	--

As shown in the table above, Big Bear Lake has the most stringent WQOs. The nutrient limits for an NPDES permit to Stanfield Marsh/Big Bear Lake are expected to align with the Santa Ana Basin Plan WQOs and the TMDL numeric targets to protect the beneficial uses of Big Bear Lake. The anticipated effluent nutrient limits of 35 µg/L-P for TP and 0.15 mg/L-N for TIN would require multiple process treatment steps and consistent treatment through seasonality. In addition, the Program Team is committed to working with the Santa Ana Regional Board and DDW to protect the municipal (MUN) beneficial use of Big Bear Lake. As a reflection of that commitment, the Program Team is planning to implement full advanced treatment, through the installation of the AWPf.

The *Water Quality Control Plan for the Santa Ana River Basin Region 8* (Santa Ana Basin Plan) provides the framework for the RWQCB’s regulatory program (Santa Ana Regional Board, 2019). Specifically, it:

1. Sets forth surface and groundwater quality standards for the Santa Ana Region.
2. Identifies beneficial uses of water and discusses objectives that shall be maintained or attained to protect those uses.
3. Provides an overview of types of water quality issues, and discusses them in the context of potential threats to beneficial uses.
4. Denotes recommended or required control measures to address the aforementioned water quality issues.
5. Prohibits certain types of discharge in particular areas of the Santa Ana Region;
6. Summarizes relevant SWRCB and RWQCB planning and policy documents, and discusses other relevant WQMPs adopted by Federal, State, and regional agencies.
7. Identifies past and present water quality monitoring programs, and discusses monitoring activities that could be implemented in future Santa Ana Basin Plan updates.

Overall, the Santa Ana Basin Plan functions as the regulatory authority for water quality standards established in local NPDES permits and other RWQCB decisions.

Colorado Basin Plan Objectives

The Colorado Basin Plan does not have numeric WQOs, but the Colorado Basin Plan’s narrative objective for TDS and nitrate is to maintain the water quality to existing historical conditions where

possible and to keep the chemical and physical groundwater quality close to or otherwise below the MCLs (RWQCB, 2006). In 2021, BBARWA received an updated WDR Permit (Order R7-2021-0023), which set average monthly effluent limits for TN and TDS of 10 mg/L and 500 mg/L, respectively. These limits are based on the current MCLs for these constituents. Through this permit, the Colorado Regional Board is protecting the water quality of the Lucerne Valley Basin.

3.6.2 Groundwater Recharge Requirements

The Groundwater Recharge Regulations require a minimum “response retention time” or minimum groundwater travel time of two months between the point of surface application or injection, and the point of extraction. The point of discharge to the Sand Canyon Recharge Area and wells that represent the points of extraction, are shown on **Exhibit 3-2**, above. BBLDWP’s extraction wells Thomas Harder & Co.’s preliminary analysis shows that the recharge water will reach the nearest production well (Sheephorn Well) in a little more than approximately 13 months. For preliminary recharge siting purposes, a “credit” of 0.25 was applied for travel time calculations using an analytical model. Thus, the credited retention time is interpreted to be 9.75 months (39 x 0.25). This credited retention time meets/exceeds the minimum retention time of two months, indicating that the simulated recharge operation is feasible based on the data assumptions in the analysis. Refer to **Appendix 4**.

Pathogen controls include specific provisions for log reduction of microorganisms and treatment process requirements. The treatment process used to treat recharge water for a Groundwater Replenishment Reuse Project must provide treatment that achieves at least 12-log enteric virus reduction, 10-log Giardia cyst reduction, and 10-log Cryptosporidium oocyst reduction from raw sewage to usable groundwater. The treatment train shall consist of at least three separate treatment processes. For each pathogen (i.e., virus, Giardia cyst, or Cryptosporidium oocyst), a separate treatment process may be credited with no more than 6-log reduction, with at least three processes each being credited with no less than 1.0-log reduction. If the treatment process itself does not achieve the required pathogen control credits, additional credit can be gained through underground retention time prior to extraction.

3.6.3 BBARWA WWTP Treatment Upgrades

BBARWA’s existing wastewater facility will be upgraded to meet WQOs identified for Big Bear Lake in the Santa Ana Basin Plan. TIN and TP must be removed through multiple in-series processes because a single process cannot reliably reduce effluent TIN and TP concentrations to the levels required for Big Bear Lake’s WQOs. To achieve these strict effluent limits, BBARWA will need to implement a series of upgrades to existing unit processes and integrate new unit processes.

As part of the Program, proposed upgrades to the BBARWA WWTP include:

- Upgrade the existing oxidation ditches to biological nutrient removal process;
- Tertiary filtration and nutrient removal via denitrification filters;
- UF and RO membrane filtration;
- Brine pellet reactor for brine minimization; and
- UV/AOP.

The new facilities would be designed for a treatment capacity of 2.2 MGD, with operational ability to divert a portion of the denitrification filter effluent directly to UV/AOP process depending on

effluent water quality targets, treatment performance and discharge permit requirements. However, it is anticipated that 100% of the water discharged will be treated with RO and UV/AOP disinfection. The anticipated completion date is 2027. A detailed summary of the treatment process upgrades is shown in **Table 3-5**.

**Table 3-5
 SUMMARY OF TREATMENT PROCESS UPGRADES**

Treatment Mode	Processes
Biological Nutrient Removal	Nitrification-Denitrification: Retrofit existing oxidation ditches to a Modified Ludzack-Ettinger (MLE) configuration with turbo blowers and diffused aeration for nitrogen removal.
Tertiary Filtration & Nutrient Removal	Denitrification Filter: Construct denitrification filters for nitrogen and phosphorus removal. Chemical provisions for supplemental carbon and chemical precipitant addition will be provided for denitrification and phosphorus removal, respectively.
Membrane Filtration	Ultrafiltration and Reverse Osmosis: Construct skid-mounted pressurized UF membranes and RO membrane facilities capable of high product recovery, high TDS removal, and removal of residual nutrients. Chemical provisions for antiscalant, pH adjustment, and remineralization chemicals will be provided. Brine from the RO system will be conveyed to the pellet reactor for brine minimization.
Disinfection	UV Disinfection: Construct closed vessel UV disinfection unit process for disinfection of denitrification filter effluent or RO permeate water. UV transmittance will be high for disinfection of the high-quality RO permeate and the UV dose will be higher than standard UV disinfection to provide strong oxidation capacity for the UV/AOP process. AOP: Construct a chemical injection and mixing system to dose a strong oxidant downstream of the UV process to destroy trace contaminants. The oxidant would be sodium hypochlorite or hydrogen peroxide, with final oxidant selection depending on final preliminary design decisions.
Brine Minimization	Pellet Reactor: Construct a skid-mounted pellet reactor system which provides brine minimization through additional RO membrane filtration and precipitation of partially soluble salts through a fluidized bed reactor.
Brine Management	The RO brine management option included in the preliminary design for Replenish Big Bear is a brine minimization pellet reactor to reduce the volume of brine produced by the RO process. The reduced brine stream from the pellet reactor will be conveyed to Solar Evaporation Ponds located on BBARWA WWTP property. It is assumed that an RO recovery of 90% at 2.2 MGD influent flow would result in 0.22 MGD of RO brine to be minimized through the pellet reactor and approximately 0.022 MGD of liquid brine to be conveyed to the evaporation pond based on a pellet reactor recovery of 90%. A total evaporation pond area of 23 acres is needed for the brine stream. However, if a higher yield cannot be achieved up to a total evaporation pond area of 57 acres would be required. Site specific treatment performance of the pellet reactor will be evaluated during the piloting phase. Adjustments to total system recoveries and the brine management process could be made based on site-specific piloting results.

For comparison purposes, a schematic of the existing treatment processes is shown in **Exhibit 3-3**, and the proposed upgraded treatment process schematic is shown in **Exhibit 3-4**.

Exhibit 3-3: EXISTING TREATMENT PROCESS SCHEMATIC

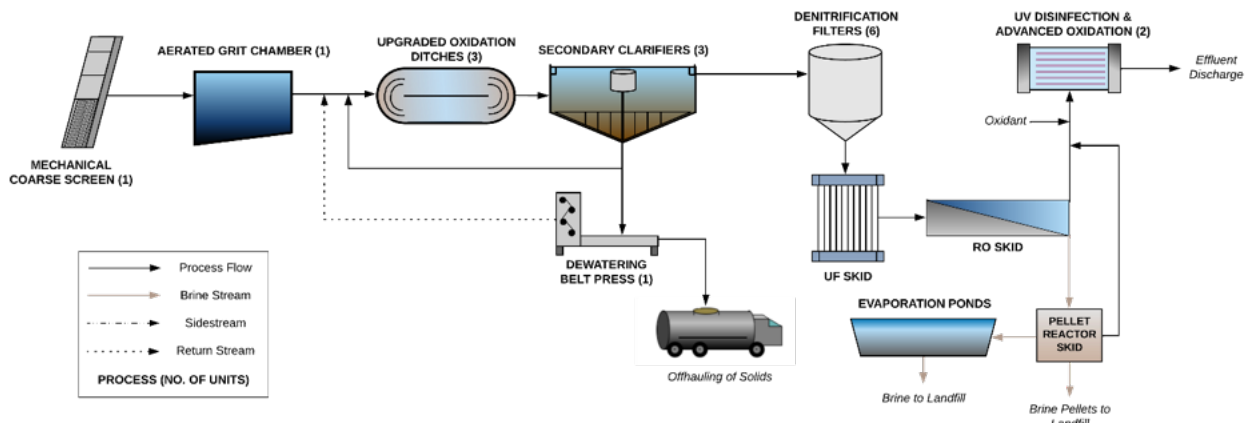

Exhibit 3-4: FUTURE UPGRADED TREATMENT PROCESS SCHEMATIC

The proposed upgrades (i.e., new advanced treatment train) would be designed for a treatment capacity of 2.2 MGD. By 2040, accounting for expected growth, it is estimated that the WWTP could produce 2,200 AFY of full advanced treated effluent, assuming a 99% total recovery rate could be achieved (90% RO recovery and 90% recovery of brine through brine minimization). The WWTP currently produces about 2.0 MGD of undisinfected secondary effluent on an average annual basis.

BBARWA also plans to maintain the existing LV Site (**Figure 3-35**). All WWTP process water in excess of the new treatment train’s 2.2 MGD capacity will continue to be treated to undisinfected secondary levels and conveyed to the existing LV Site, consistent with the current permitted discharge requirements of the existing BBARWA WWTP. At present, the discharge is planned to continue to be utilized by the farmer who leases the LV Site from BBARWA. In this instance, of the 190-acre portion of the parcel that is farmed at present within the 480-acre LV Site, only about 40 acres would be utilized to grow winter crops between the months of approximately December

through May, due to the reduction in flow to Lucerne Valley from about 2,190 AFY to about 340 AFY with the implementation of the proposed Program.¹⁰

If the continuation of farming at the LV Site is infeasible due to lack of sufficient water, lack of sufficient demand for the crop, or is infeasible due to cost of continuing the farming operation by the farmer, BBARWA would either use the LV Site unlined discharge basins (**Figure 3-35**) to handle the 340 AFY of secondarily treated effluent or could make the treated effluent available to another party for an alternative use. Under any of the above scenarios, a portion or all of the LV Site would become fallow as a result of the reduction or cessation of farming operations, and would continue to be maintained by BBARWA. At present, BBARWA and the farmer who leases the LV Site are responsible for maintaining the site. Under the proposed Program, BBARWA is considering enhancing site maintenance at the LV Site within areas that would become fallow from the reduction or cessation of farming operations at the LV Site. Enhanced site maintenance options are presently being explored by BBARWA, and include, but are not limited to, the following possible options:

- Weed abatement and dust control through use of dust control applications and eco-conscious weed killing applications;
- Planting cover crops, such as sorghum to prevent dust migration; and/or,
- Restoration and stabilization of the site utilizing salt bush and other native shrub species, which are self-sustaining with precipitation over the long term.

The proposed treatment upgrades would include the following:

- Modify and upgrade the existing oxidation ditch extended aeration process to a MLE process for increased biological nitrification-denitrification (NDN). Denitrification occurs in anoxic conditions which will be incorporated into the existing infrastructure with modifications to the tankage to provide volume without aeration. If needed, chemical precipitation of soluble phosphorus can be performed through addition of a metal salt within the activated sludge tankage, upstream of clarification.
- Nutrient-laden liquid sidestreams, which are produced during solids handling processes, may require management or treatment due to the potential negative impacts of returning high nutrient loads to other unit processes. Sidestream treatment would require additional on-site tankage and mechanical aeration. The need for side stream treatment will be determined during subsequent phases of the Program when piloting and plant-wide process modeling is performed; however, because digestion of solids will not be performed at the upgraded WWTP, sidestream treatment is not likely to be required.
- Retrofit or operational modifications to secondary clarifiers for settling of phosphorus precipitates such as adding a chemical injection and mixing location and modifications to the baffling within the clarifier. Removal of phosphorus through chemical precipitation would increase solids production and require additional operational time of the WWTP's existing sludge dewatering equipment to process the increased solids load. It is anticipated chemical precipitation of phosphorus will not be required, which will be verified during subsequent phases of the Program when piloting and plant-wide process modeling is performed.
- Addition of a tertiary filtration and nutrient removal process using biologically active denitrification filter with sand or synthetic media. Chemical precipitation of phosphorus

¹⁰ It is important to note that BBARWA's wastewater flow to the LV Site is not considered an adjudication water right or claim to the LV Site, but only considered to be an accounting for that supply (**Appendix 23**). Since BBARWA's wastewater is not included in the LV [Basin's Site's](#) annual yield calculation or claim to that supply, BBARWA is not bound by the [LV Basin's Site's](#) adjudication and its wastewater can be diverted to be reused in Big Bear Valley at BBARWA's discretion. (**Appendix 24**).

with a metal salt (e.g., polyaluminum chloride or aluminum potassium sulfate) will be incorporated to provide phosphorus removal within the filter. The denitrification process will likely require an external carbon source (e.g., glycerol) to facilitate the reduction of nitrate.

- Low pressure UF, to reduce solids upstream of the RO process.
- RO to reduce TDS concentration and nutrient concentrations. The assumed operational recovery for the RO system is 90% of the design flow. Emerging RO technologies that are configured for brine recirculation, multiple pass, or in-series operation to achieve high recoveries (such as closed-circuit reverse osmosis) have been demonstrated to achieve high recovery rates with reduced energy consumption at comparable capital costs to conventional RO. Such technologies would need to be piloted with BBARWA’s specific water quality characteristics to verify expected performance for this application. The low-pressure UF and RO unit processes are expected to provide the physical filtration for reduction of the 0.5 to 2 mg/L of TIN and TP coming from upstream processes. RO is the only unit process capable of removing TDS, making it a critical unit process for compliance with WQOs. It is assumed that 100% of the design flow will need to receive RO treatment to meet the WQOs. RO offers the advantage of removing TDS, organics, inorganics and nutrients to a sufficient level for meeting nutrient WQOs.

Projected treatment performance downstream of each unit process is shown in **Table 3-6**. Potential water quality performance for TIN, TP and TDS constituents are estimated for each unit process; however, the performance of each of these unit processes is highly site specific based on the water quality composition being treated. A pilot test of each unit process is required to refine performance estimates and establish design criteria.

**Table 3-6
 PROJECTED TREATMENT PERFORMANCE FOR THE PROPOSED TREATMENT PROCESS**

Constituent	Primary Treatment	Biological Nutrient Removal	Denitrification Filter	UF/RO	UV/AOP	Water Quality Objectives
TIN (mg/L-N)	30	4	0.8	0.1	0.1	0.15
TP (mg/L-P)	8	2	0.3	0.03	0.03	0.035
TDS (mg/L)	450	450	450	50	50	175

The scope of the upgrades are shown in **Figures 3-22 through 3-28**. **Figure 3-22** shows the location of the BBARWA WWTP overlaid on the FEMA Flood Hazard Areas. **Figure 3-23** shows the location within the existing BBARWA WWTP at which the anoxic zone mixers, diffused air grid systems, and four turbo blowers in precast buildings are proposed to be located. **Figure 3-24** shows the location within the existing BBARWA WWTP at which the effluent pump station and pipeline will be installed, while **Figure 3-25** shows this same area in more detail, showing a diagram of the facilities and processes located in this building. **Figure 3-26** shows the location within the existing BBARWA WWTP site at which up to 57 acres of Solar Evaporation Ponds would be installed. **Figure 3-27** shows the site availability at the BBARWA WWTP site, and indicates existing equipment and facilities to remain, to be removed, or with a tentative status. **Figure 3-28** is a continuation of the previous figure showing site availability and areas to be preserved within the BBARWA WWTP.

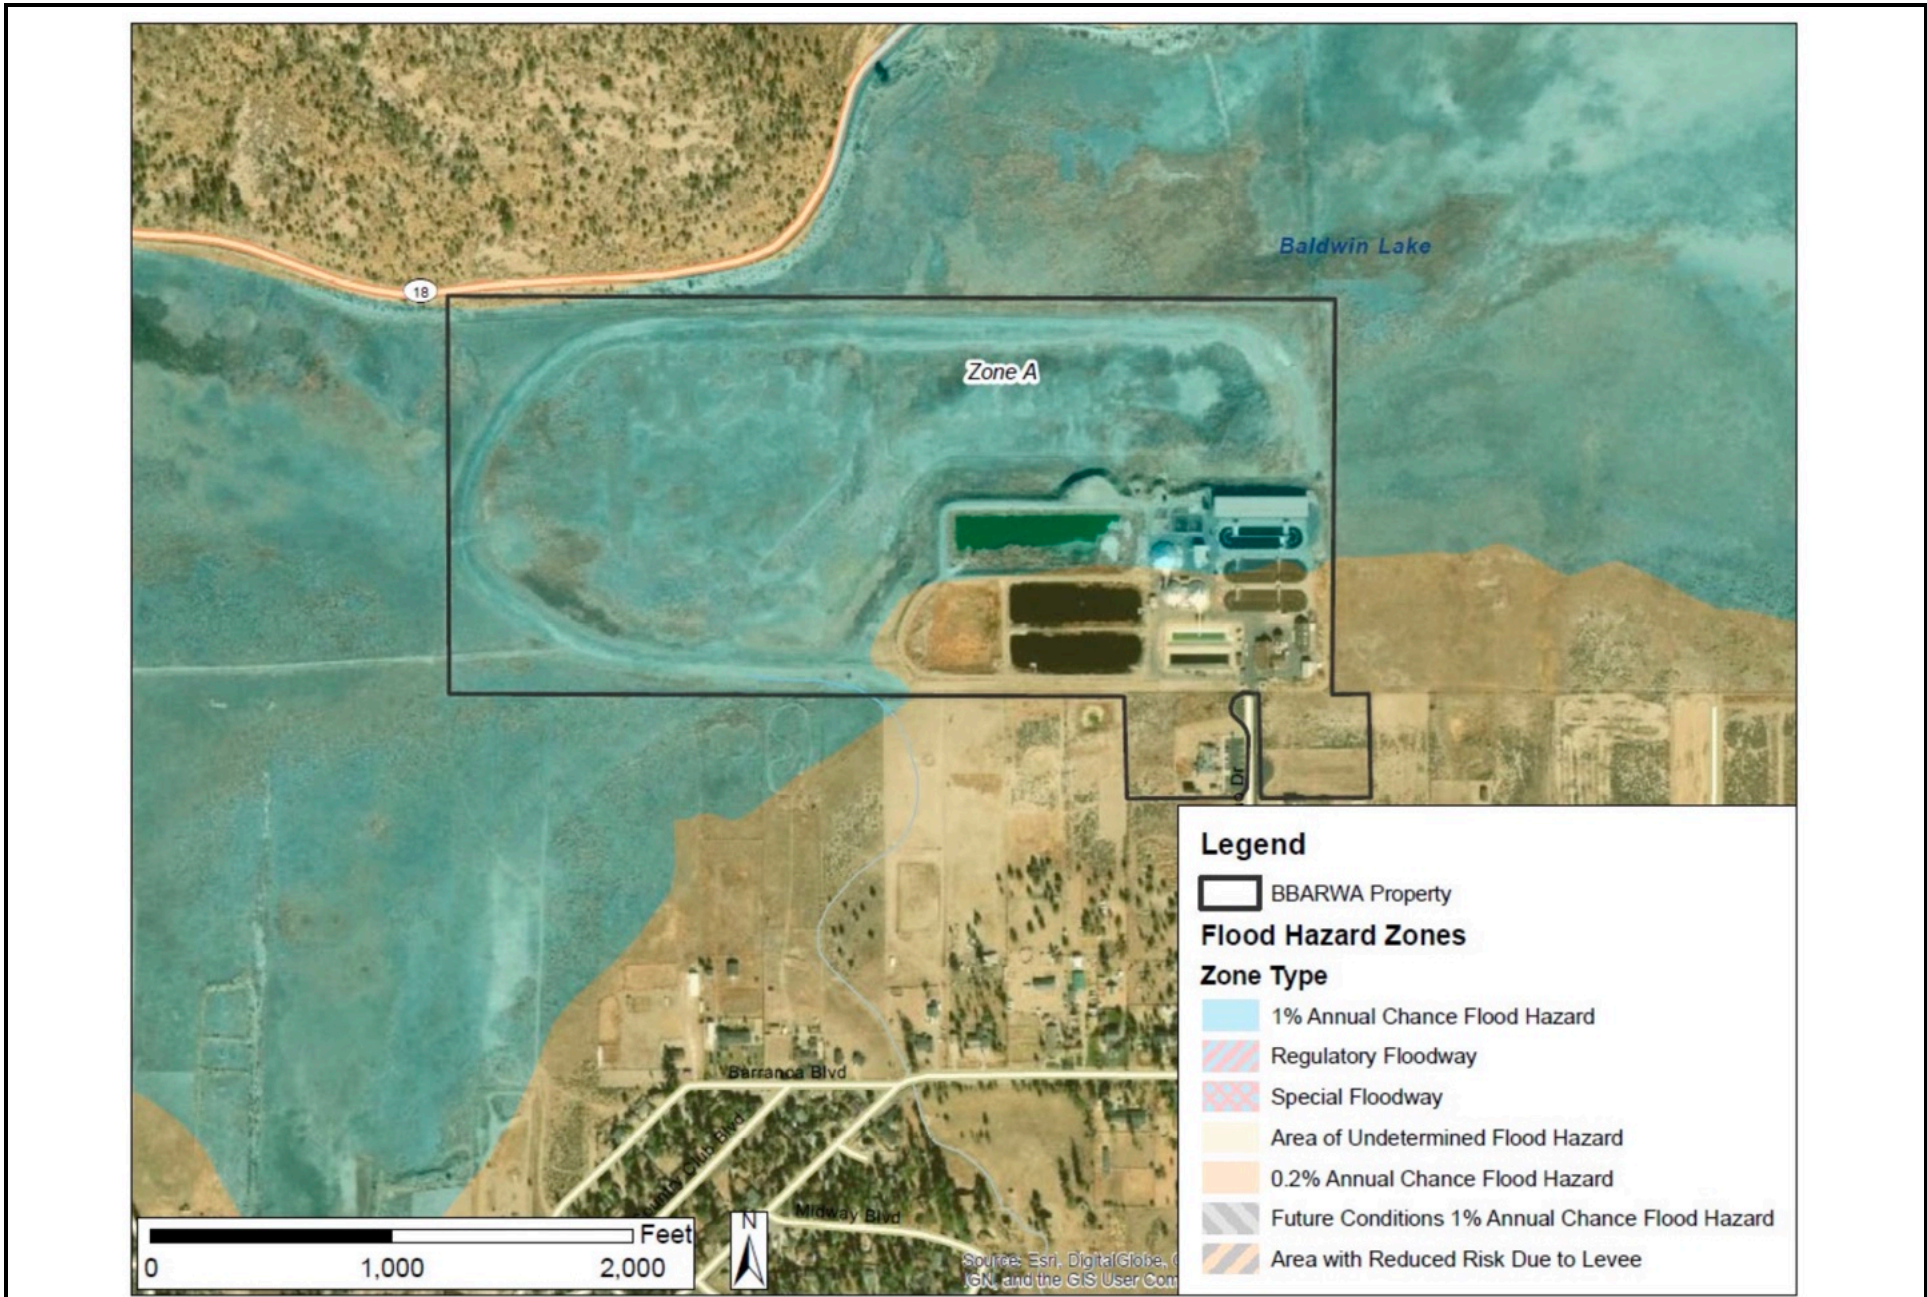

FIGURE 3-22

Scope of Upgrades

FIGURE 3-25

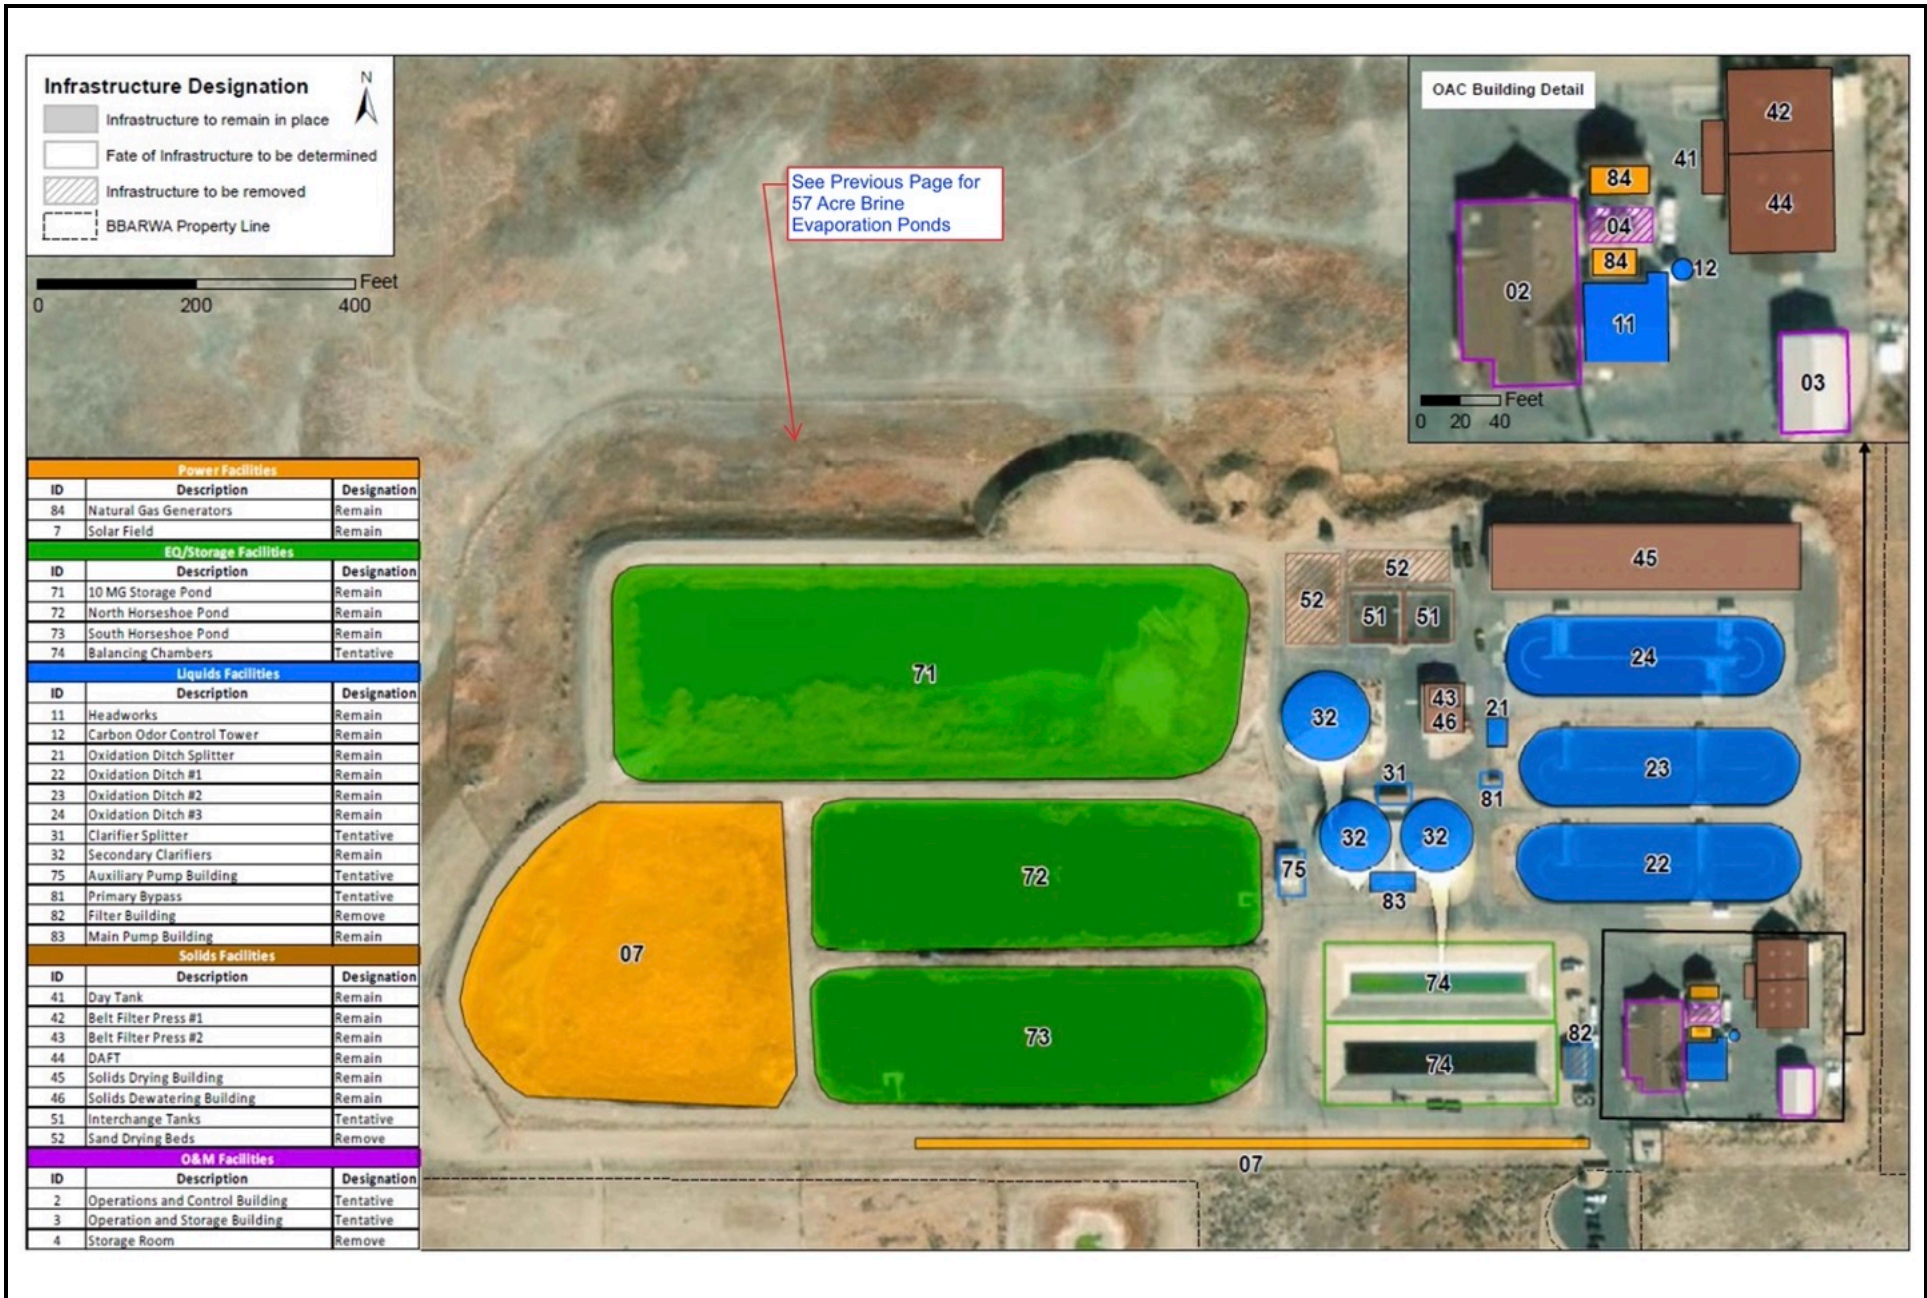

FIGURE 3-27

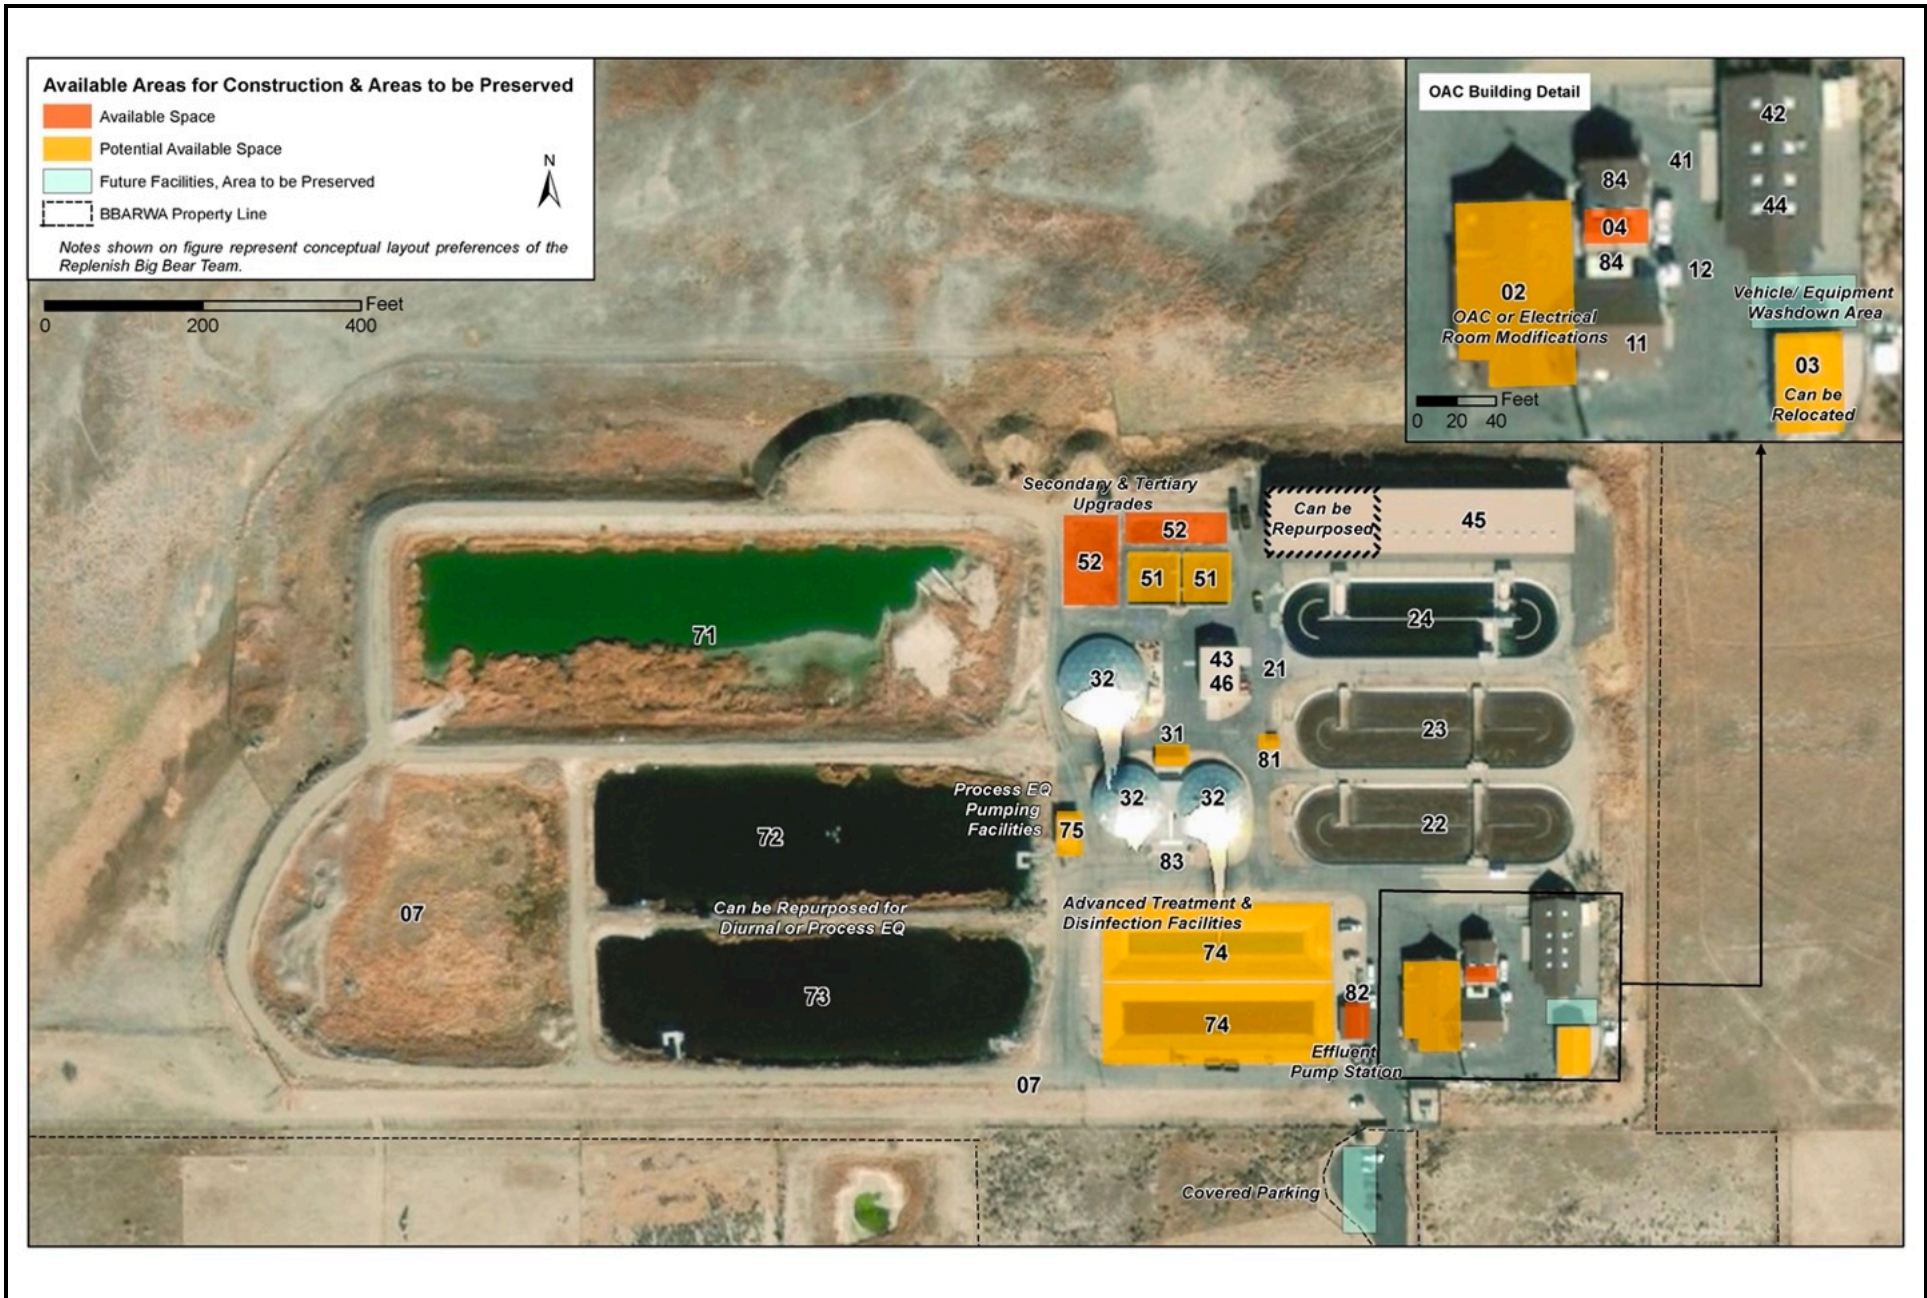

FIGURE 3-28

Anticipated Water Quality and Annual Flow

An analysis of Big Bear Lake was completed in 2021 and 2022 to evaluate the water quality impacts of key constituents on Stanfield Marsh and Big Bear Lake. The analysis assumed that the discharge would be 100% treated and disinfected with RO and UV, which is referred to herein as “Option 3”. Since the completion of this analysis, BBARWA agreed to add AOP to the treatment to protect the MUN use of Big Bear Lake. Therefore, the water quality is expected to improve for some constituents. **Table 3-7** presents Big Bear Lake Discharge flow projections that were considered in the Lake Analysis model (**Appendix 2**) and in the 2022 update to the Lake Analysis provided as an Appendix to the Lake Analysis Model.

**Table 3-7
 INITIAL AND UPDATED LAKE DISCHARGE FLOW RATE PROJECTIONS**

Modeled Scenario	Program Inflow (AFY)	Daily Program Inflow (MGD)
Baseline (No Program)	0	0
Option 3 ^(a)	1,920	1.71
High Flow (99% recovery) ^(b)	2,200	1.57-2.18
Mid Flow (90% recovery) ^(b)	2,009	1.42-1.98

Notes: **a)** Option 3 (therein referred to as “Alternative 3”) was assessed in the 2021 Lake Analysis and assumed that of the total Replenish Big Bear effluent contribution considered in the Lake Analysis (i.e., 2,000 AFY), 80 AFY would be delivered to Shay Pond. Therefore, only 1,920 AFY would be discharged to Big Bear Lake at a constant flow. **B)** In the 2022 Lake Analysis update it was assumed that no discharge to Shay Pond would occur and all Program Water would be discharged to Big Bear Lake under two different total recovery rates scenarios and monthly fluctuations.

The Lake Discharge is expected to vary seasonally, as shown in **Exhibit 3-5**. Inflows to the WWTP are lower in the summer months due to reduced inflow and fewer visitors relative to the winter season.

Exhibit 3-5: PROJECTED 2040 MONTHLY BBARWA DISCHARGES TO THE LAKE UNDER THREE INFLOW SCENARIOS

Since the Program proposed Big Bear Lake Discharge has not been assigned a waste load allocation (WLA) for TP in the nutrient TMDL, a TP Offset Program is proposed to attain a net zero TP contribution to be consistent with the Nutrient TMDL assumptions. BBARWA does not

have a WLA, as this discharge was not considered during the development of the Nutrient TMDL, which was completed in 2005. The TP loads added to Big Bear Lake by the Big Bear Lake Discharge will be offset through triennial alum applications to attain net zero TP loadings for the upcoming three years. In the event of extreme runoff (defined here as exceeding about 25,000 AFY¹¹), which has the potential to bury the reactive alum cap on the sediments and reduce its effectiveness, an alum treatment will be conducted that following spring-summer and the triennial treatment schedule will be reset.

Effluent Temperature

Lake water temperatures and WWTP effluent temperatures vary seasonally. While they are relatively similar in the summer months, the WWTP effluent temperature is considerably higher than Big Bear Lake's temperature in the winter. It is expected that the discharge permit for this alternative would include limits for effluent temperature, and/or the allowable temperature change in Big Bear Lake caused by the discharge to avoid adverse thermal impacts to aquatic habitat.

Exhibit 3-6: COMPARISON OF AVERAGE LAKE AND BBARWA EFFLUENT TEMPERATURES (2012-2017)

A supplemental simulation was conducted in 2022, which assessed the influence of the temperature of inflowing water from Replenish Big Bear on predicted near-surface (1 m) temperatures in Stanfield Marsh (Segment #4) and the eastern edge of Big Bear Lake (Segment #12) (**Exhibit 3-7**). Segment 4 is approximately 450 m from the inflow, corresponding to about 25% of the total length of Stanfield Marsh (about 1750 m).

¹¹ Approximately the 80th percentile annual inflow based on WaterMaster data for 1977-2018.

Exhibit 3-7: LAKE MODEL SEGMENTATION HIGHLIGHTING SEGMENT #4 IN STANFIELD MARSH AND SEGMENT #12 AT THE EASTERN EDGE OF BIG BEAR LAKE

Predicted mean temperatures for the two sites under the two different inflow temperature scenarios are summarized in **Table 3-8**.

**Table 3-8
 PREDICTED AVERAGE NEAR-SURFACE (1 M) TEMPERATURES IN STANFIELD MARSH (SEGMENT 4) AND BIG BEAR LAKE (SEGMENT 12)**

Location	Original	+ Heat
Stanfield Marsh (Segment 4)	11.71 ± 6.99	12.51 ± 6.54
Big Bear Lake (Segment 12)	11.99 ± 7.05	12.00 ± 7.07

Notes: See **Exhibit 3-6** for segment locations.

While the above analysis is not intended to serve as a detailed evaluation of fine-scale temperature effects on Stanfield Marsh resulting from discharge of full advanced treated Program Water, results highlight some important general findings. First of all, warm Program Water discharged to the easternmost section of Stanfield Marsh quickly loses heat through exchange with the atmosphere and is diluted with existing water; higher lake levels afford greater opportunity for heat loss and dilution such that temperature effects are more likely at low lake levels. As a result, addition of warm Program Water to Stanfield Marsh does not, based on this modeling, meaningfully alter the heat budget for Big Bear Lake and is not predicted to alter lake temperature or duration or intensity of thermal stratification.

3.6.4 Brine Disposal – Solar Evaporation Ponds

Implementation of RO treatment requires management of brine concentrate. The most common brine concentrate disposal options include deep well injection (where permitted), surface water discharge (including the ocean), discharge to a wastewater treatment plant (such as via the Inland Empire Brine Line), land disposal, and solar evaporation or Zero Liquid Discharge with disposal of solids to a landfill.

The Program Team is considering the use of solar evaporation pond(s), while all other methods of brine disposal have been ruled infeasible. Solar evaporation ponds rely on solar energy to evaporate water from the brine concentrate stream, leaving behind precipitated salts, which

ultimately are disposed of in a landfill or are disposed of as part of decommissioning the solar evaporation ponds once the useful life of the ponds has concluded. The expected useful life of the evaporation ponds is equal to or greater than the useful life of the AWPF. Solar evaporation ponds for brine concentrate disposal are most appropriate for smaller volume flows and for regions having a relatively warm, dry climate with high evaporation rates, level terrain, and low land costs. Solar evaporation ponds are relatively easy to construct, are low maintenance and have no mechanical equipment except for pumps to convey brine to the ponds. However, pond size requirements can be quite high depending on the brine flow and evaporation rates and the regulatory requirement for impervious liners of clay or synthetic membranes substantially increases the cost of construction. A monitoring well or wells will be required to be installed to verify that seepage from the ponds is not contaminating underlying groundwater.

The preliminary RO brine management option for Replenish Big Bear is a brine minimization pellet reactor to reduce the volume of brine waste from the RO process. The reduced brine stream from the pellet reactor will be conveyed to Solar Evaporation Ponds located on BBARWA WWTP property. Using an RO recovery of 90% at 2.2 MGD influent flow would result in 0.22 MGD of RO brine to be minimized through the pellet reactor, and approximately 0.022 MGD of brine to be conveyed to the evaporation pond based on a pellet reactor recovery of 90%. A total evaporation pond area of 23 acres is needed for the brine stream. However, if the higher yield cannot be achieved up to a total evaporation pond area of 57 acres would be required. Site specific treatment performance of the pellet will be evaluated during the piloting phase. Adjustments to total system recoveries and the brine management process could be made based on site-specific piloting results.

3.6.5 Treated Water Storage and Distribution

Big Bear Lake Discharge

The treated water is planned to be discharged continuously to Shay Pond and Stanfield Marsh; therefore, treated water storage at the WWTP is not required. A single effluent pump station is assumed to pump wastewater effluent treated water to meet discharge requirements for both Shay Pond and Stanfield Marsh; the variation in elevation of the two discharge points is approximately 15 feet. The pump station capacity will match the capacity of the AWPF, which is 2.2 MGD, or approximately 1,520 gpm. A new effluent pump station may be required, but if the existing effluent auxiliary pumps could be used as the primary secondary effluent pump station, the existing secondary effluent pump station may be able to be repurposed to avoid the need for a new effluent pump station.

A new 12-inch pipe will need to be installed from the WWTP to the proposed discharge points in Stanfield Marsh, as shown in **Figure 3-2**, which depicts the proposed alignment alternatives for Big Bear Lake Discharge.

Sand Canyon Recharge Area

When water is needed for recharge in Sand Canyon, it is assumed that the Resort's existing snowmaking facilities will be used to transfer water into the existing storage pond located at Bear Mountain Ski Resort and a new pump station would be constructed near the pond to convey water through a new pipeline to discharge into Sand Canyon, as shown in **Figure 3-29 and 3-32**. The pump station and pipeline are sized to convey 380 AF of recharge water over a six -month period, which equates to approximately 471 gpm (refer to **Figure 3-30**). If a joint use arrangement for the Resort's snowmaking facilities cannot be negotiated, constructing new pumping and conveyance facilities to reach Sand Canyon would be required; however, this approach would substantially increase the Program's costs. The Program Water will be discharged at the top of the Sand

Canyon Recharge Area shown in **Exhibit 3-1**. The discharge will consist of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. The channel slope will be protected from erosion using rip rap or similar erosion control methods, similar to that which is shown on **Exhibit 3-1**. The Sand Canyon Recharge Evaluation showing the underflow analysis prepared by Thomas Harder & Co. is provided as **Figure 3-31** (refer to **Appendix 4**).

Shay Pond Discharge Project

As part of the Program, up to 80 AFY of Program Water is proposed for discharge to Shay Pond. The proposed Shay Pond Discharge Project is intended to replace potable water that is currently discharged to the pond to support the Stickleback, which, as previously stated, is a Federal and State listed endangered species. There is an existing 6-inch C-900 polyvinyl chloride (PVC) pipeline that begins at the intersection of Shay Road and Palomino Drive and terminates near Shay Pond that can be used to convey the Program Water, with an extension of approximately 710 feet to reach Shay Pond. This nearby pipeline was constructed in 1986 for future use, but has never been put into service. It is possible that this pipeline may not be useable, and as such, a pipeline traversing this same alignment and sized comparably to the existing pipeline may be required, in addition to the proposed 710-foot extension to reach Shay Pond. The length of this pipeline would be 5,600 feet.

Shay Pond has a surface area of approximately 10 acres and is located about 1.2 miles southeast of the BBARWA WWTP, shown on **Figure 3-33**. According to the Bear Valley Basin GSP, *“Shay Pond is a natural surface water body at the southern base of an unnamed ridge that separates it from Baldwin Lake. The nature of this pond is unknown, but it may be fed, in part, from spring flow, surface runoff, and periodically, groundwater intersecting the land surface. Although the pond may have historically been fed from surface water runoff in the ephemeral, upstream segment of Shay Creek, urban development has altered the course of this stream, and it no longer flows into the pond. Surface water exits Shay Pond via the downstream segment of Shay Creek, which flows northwards toward Baldwin Lake and intermittently provides water to Baldwin Lake.”* *“Surface water sources to Baldwin Lake are primarily in the form of ephemeral streams with relatively low flow volumes. The only stream where surface water flow periodically has been measured is Shay Creek at its outlet from Shay Pond.”* *“Surface water runoff does not reach Baldwin Lake during most years but percolates into the groundwater system. However, during prolonged precipitation, surface water does flow into Baldwin Lake. All surface water that enters Baldwin Lake is lost to evaporation. The high clay content of the playa sediments prevents vertical migration, and the topographical configuration of the lake prevents outflow from Baldwin Lake.”* **Figure 3-21** shows how Baldwin Lake, an ephemeral lake, is connected to Shay Pond via Shay Creek. This figure also shows the population of Stickleback in the vicinity of Shay Pond.

The population of Stickleback is unique in that it occurs at a high elevation, about 6,700 ft amsl, while all other Stickleback populations inhabit streams below 3,000 ft. As previously stated, the 2002 BO requirements state that BBCCSD will provide water to Shay Pond to maintain a minimum 20 gpm outflow from Shay Pond. The objective is to maintain a minimum pond water level that will support suitable habitat conditions for the Stickleback. BBCCSD currently meets this requirement by discharging potable water into Shay Pond, but the 2002 BO also states that, should a suitable alternative supply of water be found to be appropriate for the Stickleback in the future, BBCCSD may use an ‘in-lieu’ water supply, which could include the use of tertiary-treated water. The potable water discharged to Shay Pond represents approximately 5% of BBCCSD’s customer water demand and could be reserved for potable use instead of discharging to Shay Pond.

Shay Pond Discharge

December 19, 2023

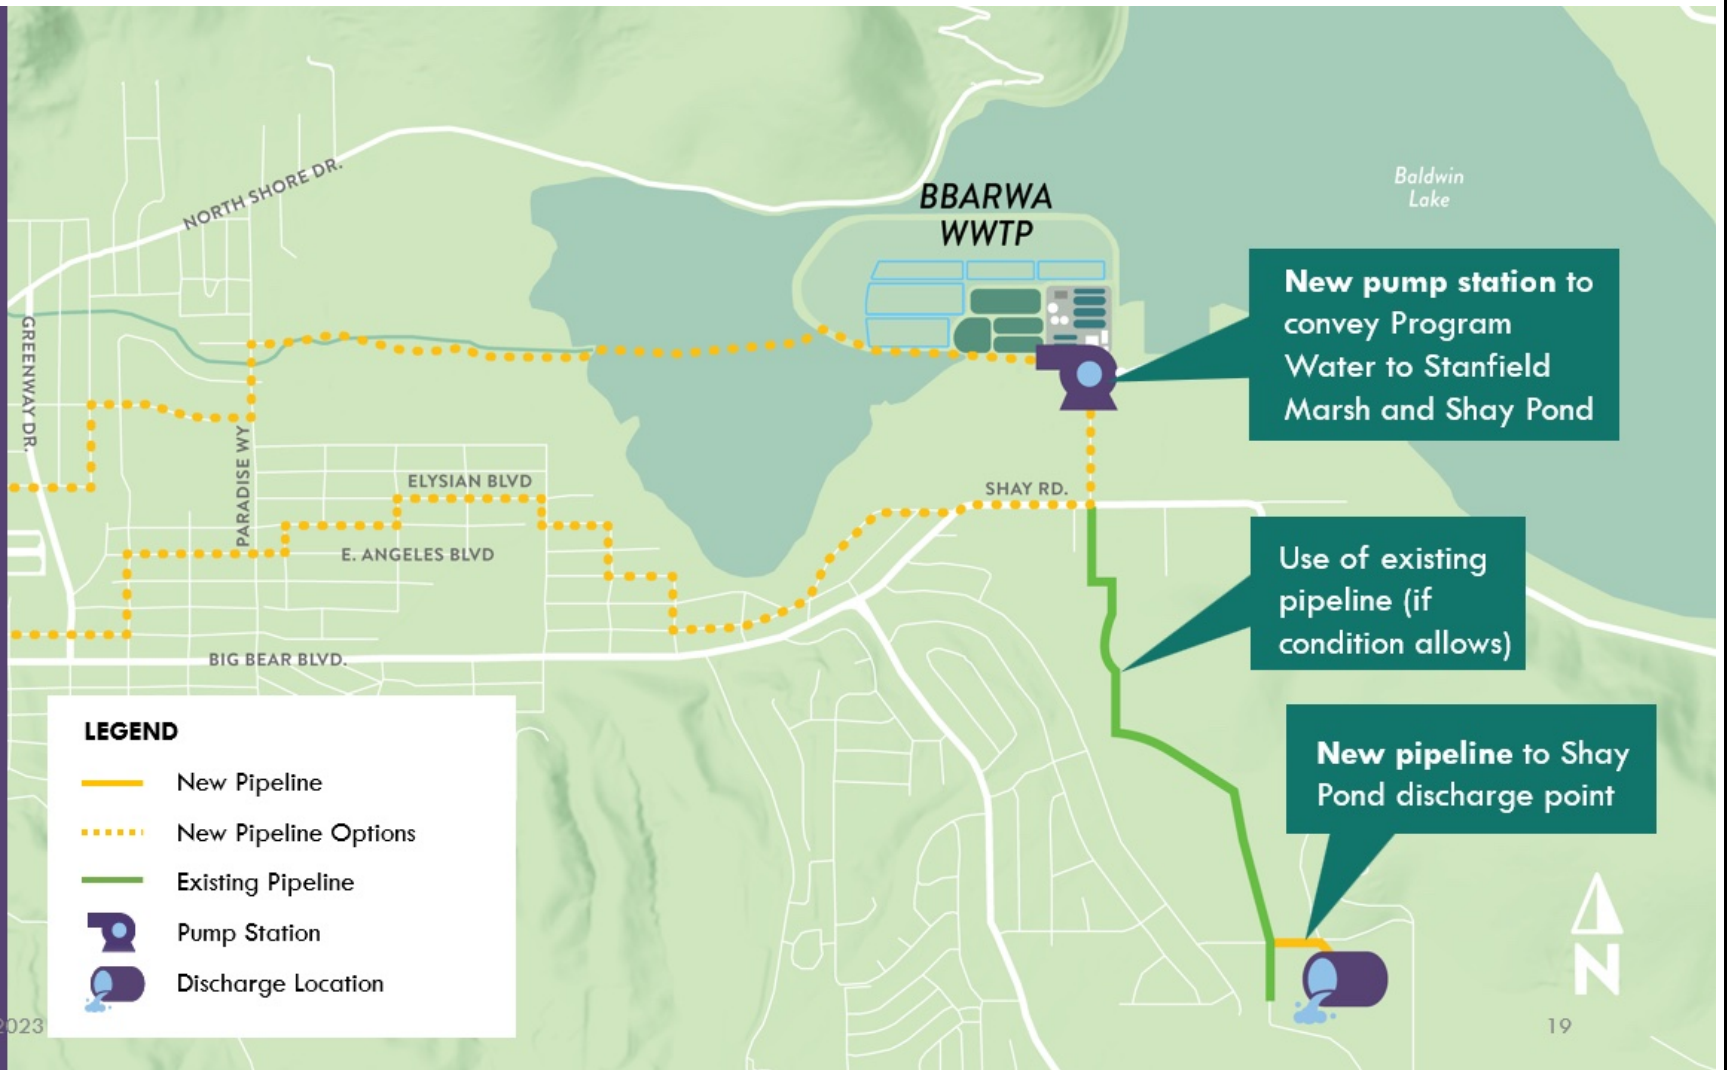

FIGURE 3-33

The discharge rate needed to maintain the required outflow, accounting for evaporation and infiltration, has varied from year to year. However, based on the average volume of discharges measured between 2012 and 2020, BBCCSD discharges approximately 50 AFY of potable water to Shay Pond on average. At times, the required discharge has been up to 80 AFY; this maximum volume is used as the basis for the project design and analysis to be conservative. **Figure 3-19** shows an aerial view of Shay Pond and the proposed discharge location.

Applicable Water Quality Standards

Per the Santa Ana Basin Plan, the protection of beneficial uses designated for Shay Creek and Baldwin Lake is primarily provided by narrative water quality objectives. Refer to the “Big Bear Area Regional Wastewater Agency Replenish Big Bear Antidegradation Analysis for Proposed Discharges to Stanfield Marsh/Big Bear Lake and Shay Pond” provided as **Appendix 3** to review beneficial uses of Shay Pond receiving waters—Shay Creek and Baldwin Lake—on Table 12 therein, and also to review a comparison of most stringent water quality objective or criterion to current BBCCSD potable water supply quality and projected effluent quality of proposed discharge on Table 13 therein.

To summarize the outcome of the comparison of WQOs provided in **Appendix 3**, the projected effluent quality of the proposed discharge to Shay Pond is better than the current potable water supply for chloride, hardness, sodium, sulfate, TDS, TN, aluminum, and specific conductance. The projected effluent quality of the proposed discharge is expected to be of similar quality as existing potable water supplies for ammonia, fluoride, methylene blue-activated substances (MBAS), cadmium, copper, and lead. Boron may be the only constituent that could be above the existing potable water supply quality. However, the average boron concentration in the Program Water proposed for discharge to the pond is well below the 0.75 mg/L Santa Ana Basin Plan objective for boron for the protection of sensitive agricultural crops, which is not a use of Shay Pond water. Additional coordination with the CDFW will be conducted to ensure the Stickleback are protected.

3.7 SUMMARY OF ALL FACILITIES

3.7.1 Replenish Big Bear Program Components Overview

The following represents a summary of the facilities required to support the Program:

BBARWA WWTP Upgrades Project

- The existing BBARWA WWTP will be upgraded to produce Program Water to serve the objectives outlined in this Program Description. These upgrades would treat wastewater to full advanced treatment at a capacity of 2.2 MGD, or approximately 2,200 AFY. The AWWPF upgrades that would occur at the BBARWA WWTP are as follows:
 - Oxidation Ditches
 - Denitrification Filter
 - UF and RO
 - UV/AOP
 - Pellet Reactor: 0.22 MGD
- Installation of about 1,350 LF of brine pipeline anticipated to be sized between 8” to 10” from the pellet reactor to the Solar Evaporation Ponds.
- Installation of a 20 gpm brine pump station within the existing BBARWA WWTP site.
- Installation of an anticipated 1,500 to 1,600 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

FIGURE 3-19

- Installation of an additional 2 MW of solar panels to be installed at BBARWA's administration and WWTP site, and within the BBCCSD site to the south of BBARWA's Administration Building. The solar panels will be installed east of the old sludge building at the WWTP as a solar field, and atop the OAC and Administration Building roofs, and within the site to the south of BBARWA's Administration Building. Refer to **Figure 3-37**.

Solar Evaporation Ponds Project

- Development between 23 and 57 acres of Solar Evaporation Ponds, depending on the total system recovery rate achieved, at BBARWA's WWTP site to accommodate 22,000 gpd to 55,000 gpd of brine concentrate.
- Installation of one or more monitoring wells at the evaporation pond on the WWTP Site to monitor groundwater quality, as required by the future discharge permit.

Stanfield Marsh/Big Bear Lake Discharge Project

- Installation of a pipeline utilizing one of three alignments shown on **Figure 3-2** from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

Shay Pond Discharge Project

- Installation of about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF (**Figure 3-34**).

Sand Canyon Recharge Project

- Installation of a new pipeline that will discharge into Sand Canyon that will be 8" in diameter, and 7,210 feet in length.
- Installation of a new 471 gpm pump station at the Resort Storage Pond to convey water to Sand Canyon.
- Installation of two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon, similar to that which is shown on **Exhibit 3-1**.

The Program would, as stated under **Subsection 3.3**, Program Purpose and Objectives, partner with Big Bear Valley agencies to recover a sustainable water resource that is currently being transported out of the Big Bear Valley to Lucerne Valley, close the water loop, and keep the water in the Big Bear Valley for beneficial reuse. This section of the Program Description is intended to outline operational and construction scenarios for the specific types of facilities and/or improvements that could result from the implementation of the Program.

The implementation of the facilities proposed as part of the Program consists of construction and operation of the various facilities summarized below. These potential facilities are separated into five Program Categories:

- 1) Program Category 1: Conveyance Pipelines
- 2) Program Category 2: Ancillary Facilities including Pump Stations and Monitoring Wells
- 3) Program Category 3: Solar Evaporation Ponds
- 4) Program Category 4: BBARWA WWTP Upgrades
- 5) Other Physical Changes to the Environment

Below are general descriptions of the facilities and operations proposed as part of the Program. Each Program Category has been formed utilizing the greatest number, intensity, lengths, and capacities for each type of facility proposed under the Program. For example, the pipeline lengths and sizes considered under Program Category 1 represent the option(s) that would require the greatest pipeline length to achieve that “Component” of the Program.

Program Category 1: Conveyance Pipelines

The Program would ultimately install a total of about 6.59 miles or 34,810 LF of various types of pipelines. Potential alignments include the following:

- **Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment:** Pipeline to Big Bear Lake: up to 12” 19,940 LF
 - Alignment Options include:
 - **Alignment Option 1 to Discharge Point 1**
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option
 - **Alignment Option 2 to Discharge Point 2**
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option
- **Shay Pond Conveyance Alignments:**
 - New Shay Pond Conveyance Pipeline: a new 4” 710 LF pipeline would be constructed between the existing BBARWA to Shay Pond pipeline alignment to Shay Pond.
 - Shay Pond Replacement Pipeline: a possible additional 6” 5,600 LF of pipeline to replace the stretch of pipeline between BBARWA’s WWTP site to Shay Pond, which will only be required to implement the Shay Pond Discharge Project if the existing pipeline cannot be utilized.
- **Sand Canyon Recharge Conveyance Pipeline:**
 - Pipeline from the Resort Storage Pond to Sand Canyon: 8” 7,210 LF of pipeline
- **BBARWA WWTP Upgrades Project:**
 - Brine Pipeline (within BBARWA WWTP property): 8” 1,350 LF of pipeline

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

The Program would ultimately install monitoring wells in order to facilitate project operation as follows:

- Up to four (4) monitoring wells
 - **Sand Canyon Recharge Project:**
 - Two monitoring wells downstream of the Sand Canyon Recharge Area.
 - **Evaporation Ponds Project:**
 - Two monitoring wells near the Solar Evaporation Ponds at the BBARWA WWTP site.

The Program would also install three pump stations in order to facilitate project operation as follows:

- **BBARWA WWTP Upgrades Project:**
 - Effluent Pump Station @ WWTP 1,520 gpm
 - Brine Pump Station @ WWTP: 20 gpm
- **Sand Canyon Recharge Project:**
 - Pump Station @ Resort Storage Pond 471 gpm

The Program would install a pipe outlet at the top of the channel bank at Sand Canyon that discharges down the side slope of the channel into the channel bottom as part of the Sand Canyon

Recharge Project. The channel slope will be protected from erosion using rip rap or other erosion control methods, similar to that which is shown on **Exhibit 3-1**.

Program Category 3: Solar Evaporation Ponds Project

The Program would construct between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine.

Program Category 4: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to include 2.2 MGD of full advanced treatment, producing up to 2,200 AFY of Program Water. The AWP includes the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

Other Physical Changes to the Environment

While the proposed Program would result in the installation of several facilities, it would also result in other physical changes to the environment, including releasing Program Water into Big Bear Lake by way of Stanfield Marsh. The increase in water in these two areas would have the potential to enhance the visual setting of the Big Bear Valley by way of increased water in Big Bear Lake and Stanfield Marsh. This would result from Big Bear Lake being fuller, thereby minimizing the dry habitat that occurs around Big Bear Lake's rim when Big Bear Lake levels are low. Additionally, in Stanfield Marsh, greater provision of water in this area has a potential to support wetland/marsh habitat in a larger area than is supported on average.

The Program would also result in a change at Shay Pond in that, Program Water would be used in place of the existing water source—groundwater—in support of the Stickleback fish. This change is not anticipated to result in a physical change to the environment at or surrounding Shay Pond beyond that the source of water utilized at Shay Pond will be altered.

The Program will result in a flow reduction to LV Site from about 2,190 AFY to about 340 AFY on average. The flows BBARWA will send to the LV Site will vary based on the hydrologic conditions. For example, in a dry year, no water would be sent to the LV Site, and in a wet year, like in 2011, up to 1,050 AFY could be sent to the LV Site. The reduction in discharge would limit the ability to continue the use of the site from an existing use of 190 acres of the 480-acre site, to a utilization of 40 acres of the LV Site for farming purposes. The LV Site would continue to be owned by BBARWA, and BBARWA would ensure that the site is maintained. As discussed under **Subsection 3.6.2**, above, enhanced site maintenance options are presently being explored by BBARWA, and include, but are not limited to, the following possible options:

- Weed abatement and dust control through use of dust control applications and eco-conscious weed killing applications;
- Planting cover crops, such as sorghum to prevent dust migration; and/or,
- Restoration and stabilization of the site utilizing salt bush and other native shrub species, which are self-sustaining with precipitation over the long term.

3.7.2 Program Category 1: Conveyance Pipelines

Operational Scenario: Pipelines

Pipelines: Once a pipeline is installed, operations do not require any visits unless unforeseen circumstances arise that would require maintenance or repair of the pipelines. In the event of routine maintenance one vehicle trip per maintenance event would be required.

Construction Scenario: Pipelines

An estimated 6.59 miles or 34,810 LF of pipeline may be installed in support of the Program. The maximum pipe length that would be installed in a single year would be 29,210 LF. Installation of 29,210 LF of pipeline could occur over a period of one year to coincide with the opening year (2027) of the 2.2 MGD upgraded BBARWA WWTP.

Preliminary analysis has identified that the piping will range from 4-inch to 12-inch diameter. It is assumed that an underground utility installation team can install an average of 200-400 LF of pipeline per day. A team consists of the following:

- 200-400 ft of pipeline installed per day
- 1 Excavator
- 1 Backhoe
- Compaction equipment
- 2 pickup trucks with supplies and hand tools
- 1 Paver
- 1 Roller
- 1 Water truck
- Traffic Control Signage and Devices
- 10 Dump/delivery trucks (up to 80 miles round trip distance)
- Employees (10 members per team, 80-mile round-trip commute)

The emissions calculations are based upon the above assumptions for each pipeline installation team. Typically, up to 400 ft of pipeline trench could be excavated, the pipe installed, backfilled, and compacted each day during pipeline installation in undeveloped areas whereas only 200 ft per day can be installed in developed roadways. In either case equipment would be operated for roughly the same portion of the day and daily equipment emissions would be the same, except, that undeveloped areas would not require pavement removal and reinstallation.

It is assumed that up to of 1,000 LF per day would be installed utilizing multiple teams (up to four teams working on any given day). It is assumed that the proposed pipeline installation will occur for a maximum of 260 days in one calendar year.

Ground disturbance emissions assume roughly half an acre of land would be actively excavated on a given day. It is anticipated that installation of pipeline in developed locations will require the use of a backhoe, compactor, roller/vibrator, pavement cutter, grinder, haul truck, and two dump trucks operating six hours per day; a water truck and excavator operating four hours per day and a paving machine and compactor operating two hours per day. Installation of pipeline in undeveloped locations would require the same equipment without the paving equipment (cutter, grinder, paving machine). Pipeline trenches will have a depth of approximately 4.5' to 6'. Trench widths could be as small as 1.5' for 4" piping and could be as wide as 4.5' for 12" piping.

The pipelines that would be installed in support of Replenish Big Bear are anticipated to use push-on joints (e.g., gasketed bell-and-spigot) that do not require welding. However, the Contractor may occasionally use a portable generator and welder for equipment repairs or incidental uses.

3.7.3 Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Operational Scenario: Ancillary Facilities including Monitoring Wells

Monitoring Wells: The Program anticipates the installation of up to four new monitoring wells; two for Sand Canyon and two for the Solar Evaporation Ponds. The four monitoring wells will be visited by a field technician on a monthly to quarterly frequency. There is negligible energy consumption in obtaining groundwater levels from a monitoring well.

Pump Stations: Pump stations that are incorporated into the Program will be operated to convey the water or brine generated by the proposed BBARWA WWTP Upgrades, the capacity and amounts of water pumped varies. A total of three pump stations will be installed.

It is assumed that the brine pump station would be 20 gpm capacity with 5 HP pumps and the effluent pump station would be 1,500 to 1,600 gpm with 25 HP pumps.

Operational Scenario: Sand Canyon Discharge

Pipeline outlet and erosion control: Once the pipe outlet and erosion control are installed, operations do not require any visits unless unforeseen circumstances arise that would require maintenance or repair of the pipe outlet and erosion control. In the event of routine maintenance one vehicle trip per maintenance event would be required.

Construction Scenario: Well Development

Four new monitoring wells will be drilled and constructed approximately one year prior to the initiation of the Program in 2027.

The depth of a new wells is anticipated to range between 250 and 750 feet bgs, or as directed by the hydrogeologist. The average area of disturbance required to drill and construct each new well is anticipated to be half an acre or less. Drilling of up to four new wells during a given year, with flexibility to construct the four wells over a period of two or more years, will require the delivery and set up of the drilling rig at each site. It is anticipated these wells may be drilled concurrently, or at different times and the drilling equipment will be transported to and from the sites on separate occasions. For the purposes of this evaluation, it is forecast that delivery of the drilling equipment four times in a year will result in four 80-mile round-trips for the drill rigs.

It is anticipated that about five persons will be on a given well site at any one time to support drilling and well construction: three drillers, the hydrogeologist inspector, and a foreman. During the course of well drilling and construction at any given site, trips to and from the well site will include: one roundtrip for the drilling rig; between two and three roundtrips for cement trucks; about five trips to deliver pipe; and about four round trips per day for employees.

For analysis purposes it is assumed that each well would be drilled using the direct rotary or fluid reverse circulation rotary drilling methods. The average area of disturbance to drill and construct each well is estimated to be one-half an acre or less. Access to the drilling site for the drilling rig and support vehicles would be from adjacent roadways. Typically, site improvements to allow well drilling requires only minimal earth movement and/or grading.

The drilling and development of each well will require drilling to—in most cases—between 250 and 750 feet bgs. The proposed schedule for constructing each well would be as follows: drilling, construction, and testing, where required, of each well would require approximately six weeks to complete (about 45 days, of which 15 to 20 days would include 24-hour, 7-day a week drill activity). For planning purposes, a construction and testing schedule duration of 60 days per well is assumed to account for unforeseen circumstances (e.g., extreme weather, equipment breakdowns, etc.) that could affect the drilling and testing schedule. The well casings are expected to be flush-threaded PVC wells and it will be assumed that well development and installation will require a two-week use of a diesel generator.

The borehole for the well would be drilled using at least two separate drilling passes. The first pass, or pilot borehole, would be drilled to an estimated maximum depth below the ground surface, which would correspond to the top of the consolidated bedrock in the area, or a depth selected by the project hydrologist/hydrogeologist. Upon completion of the geophysical logs, the pilot borehole would be enlarged (reamed) to a diameter of 24 inches to approximately the same depth to accommodate the well casing, screen and filter pack.

Once each well is constructed it would immediately be developed through a process of swabbing and airlifting. During this process, drilling fluids and suspended sediment would be removed from the well. After the drilling fluids are removed along with most of the suspended sediment, the well would be further developed through pumping.

Each monitoring well will be completed at the surface with either a flush mounted, traffic rated manhole cover that is bolted in place or a 12-inch diameter steel monument that extends approximately three feet above the ground. The monument will be fitted with a locking lid and surrounded by four traffic bollards. The final footprint of the completed monitoring well will be approximately 10' by 10'.

Construction Scenario: Pump Stations

The total number of pump stations to be constructed in support of the Program is anticipated to be three.

It is forecasted that, at each site, no more than 0.5 acre will be actively graded on a given day for site preparation of each pump station. Construction of each pump station will require the delivery and installation of equipment and materials. It is anticipated that grading activities will occur over a give-day period and this phase of construction will result in six truck trips on the worst-case day with an average round trip of 80 miles delivering construction materials and equipment (concrete, steel, pipe, etc.). Installation of the pump station will require the use a crane, forklift, backhoe and front loader operating four hours per day. Calculations assume five workers will each commute 80 miles round-trip to the work site.

Each pump station is assumed to be housed within a CMU building, and will require a transformer to be installed to provide electric power to the pumps. The proposed pump station building may include a pump room and electric control room. Construction of the pump stations would involve site preparation and grading, construction of structural foundations, installation of piping and electrical equipment, pump and motor installation, and final sitework.

Two of the pump stations proposed are located at the BBARWA WWTP site and one is located offsite at Sand Canyon. The onsite pump stations will have the same backup power that supplies the BBARWA WWTP process equipment, and the Sand Canyon pump station will have a portable backup generator.

Construction Scenario: Sand Canyon Discharge

Pipeline outlet and erosion control: The construction associated with the pipe outlet would be consistent with the pipeline construction scenario described under **Subsection 3.7.1**, above.

Erosion control would, both during construction, and once completed, encompass an area of less than 15' x 15'. Construction of the erosion control will require the delivery and installation of equipment and materials. It is anticipated that construction will occur over maximum of one week period and this phase of construction will result in five truck trips on the worst-case day with an average round trip of 80 miles delivering construction materials and equipment (concrete, rip-rap, pipe, etc.). Installation of the erosion control will require the use a forklift, backhoe and front loader operating four hours per day. Calculations assume five workers will each commute 80 miles round-trip to the work site.

3.7.4 Program Category 3: Solar Evaporation Ponds Project

Operational Scenario: Solar Evaporation Ponds

Operations at this evaporation pond consists of storage and evaporation of the brine stream from the pellet reactor process. The energy required to pump brine from the pellet reactor process to the onsite Solar Evaporation Ponds is presently unknown, but it is expected to be low since the pump station is only sized for 20 gpm and it is conveying brine to a lower elevation than the pellet reactor process. The evaporation pond will be segmented into different basins so they can rotate in cycles of filling with brine, evaporating the water from the brine, and performing maintenance to remove the brine from basins that have completed the evaporation stage. Basin maintenance is expected to occur approximately two-three times a year, consisting of possible removal of the brine, maintenance of liners and grading, removal of vegetation, and vector management.

Construction Scenario: Solar Evaporation Ponds

The Program would install between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP Site shown on **Figure 3-26**, depending on total system recovery.

With respect to new evaporation pond, it is forecast that for site preparation, no more than eight acres will be actively graded on a given day. Each new pond is anticipated to be 8 to 10 feet deep with berms built up from the existing grade to create pond areas. Given the area required to install the new Solar Evaporation Ponds, it is anticipated that the time required for the construction is about 370 days (May 2025 to October 2026).

The pellet reactor process will “reject” a brine stream with high dissolved solids content (i.e., brine). Single basin dimensions would range from about 400 to 800 feet long and 400 to 800 feet wide, or about 3.75 to 7.5 acres to provide 6 to 10 ponds to accommodate the brine discharged from the treatment process. The berms would be built up so that the top of the berms are level with the existing grade of the WWTP. This would provide protection from flooding in that area without requiring excavation much below the existing grade in that area.

As stated above, the Solar Evaporation Ponds would be constructed using large construction equipment; earthen berms would be installed; and the basins would be lined with an impermeable liner to prevent percolation of the brine into the underlying soil. Periodically, the residual solids (primarily consisting of salts left after evaporation) would be collected and disposed of at an appropriately licensed disposal facility.

It is anticipated that grading activities will occur over a 90 to 120-day period and will require two bulldozers, two front end loaders, two water trucks, several scrapers, two excavators and four

dump/haul trucks operating six to eight hours per day. Calculations assume 10 workers will each commute 80 miles round-trip to the evaporation pond construction site at the BBARWA WWTP.

Construction of the new Solar Evaporation Ponds will require the delivery and installation of equipment and materials. It is not known whether each site will require import or export of soil, as the new Solar Evaporation Ponds will require some excavation of the existing area to provide fill dirt for the earthen berms to create the pond areas. Given the size of the proposed six to ten ponds (400 feet to 800 feet wide x 400 feet to 800 feet long x 10 feet in depth), it is anticipated that a cut amount from one to two-feet of the existing grade will provide enough fill dirt to create the earthen berms of the ponds. However, it is anticipated that no more than a total of 175,000 CY of materials would be hauled off site by 15 to 30 CY trucks, as an estimated one half of the cut material will be used as fill material to enhance flood control from installation of the proposed basins. No more than 100 round trips per day at an 80-mile round-trip distance would be required to accomplish the effort to remove excess materials off-site. This would occur over the three-year planning horizon for construction for the Program with some periods without hauling activities, and other periods that would reach 100 round trips per day. An estimated total of 8,000 round trips total (trucks and employees) would be required to haul excess materials to a soil receiving facility.

In addition to the above construction equipment, heavy duty trucks will be employed for on-site deliveries. Smaller trucks and automobiles will be utilized for on-site supervision and employee commuting. The diesel delivery trucks are assumed to require 100 on-road miles per day for a total of 30 days.

3.7.5 Program Category 4: BBARWA WWTP Upgrades Project

Operational Scenario: BBARWA WWTP Upgrades

Please refer to **Exhibit 3-3**, which depicts the proposed modifications to the BBARWA WWTP to enable the installation of the proposed advanced water treatment facility.

The Operational Scenario for the upgrades to the BBARWA WWTP include 2.2 MGD of advanced treatment, producing up to 2,200 AFY of advanced treated water. The updates include:

- Oxidation Ditches
- Denitrification Filter
- UF and RO
- UV Disinfection
- Pellet Reactor: 0.22 MGD

The advanced treatment plant will operate 100% of the time at 70%-100% capacity. The existing facility uses about 3,250 MW-hours/year, and the advanced treatment plant will use an additional 3,800 MW-hours/year. The additional energy demands will be accommodated by the addition of a new 2 MW of solar panels (generating 3.67 MW of electricity per day) that would be installed at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building.

Construction Scenario: BBARWA WWTP Upgrades

The construction activities to install upgrades at the BBARWA WWTP consists of the following range of activities: demolition of existing concrete basins, grading activities to prepare site for new construction, construction of concrete foundations and supports, installation of piping, equipment, and instrumentation, connection to existing electrical equipment and onsite utility water system

construction of building foundations and building structures, and installation of treatment equipment.

Civil and site work for the proposed BBARWA WWTP Upgrades would include demolition, grading, drainage, and site improvements. The area around new structures and processes would be backfilled to match existing finished surfaces. All disturbed areas would be paved, covered with crushed stone, or landscaped with ground cover. Areas that require routine vehicle access would be bituminous concrete roadways, consisting of a 12-inch gravel base course, a 2.5-inch bituminous concrete binder course and a 1.5-inch bituminous concrete top course. Areas that require routine pedestrian access would have concrete sidewalks. The sidewalk would consist of four inches of reinforced concrete on an eight-inch gravel base course. Painted steel bollards (approximately four inches in diameter and 42 inches high) would be provided as needed to protect equipment or structures that are near roadways.

Standard construction equipment will be used, ranging from dozers, graders and cranes, to backhoes. It is anticipated that the maximum number of construction personnel on the WWTP project site on any given day will be 50 persons. A maximum number of truck deliveries, probably during pouring of concrete for facilities, are forecasted at 25 per day. Construction of the WWTP Upgrades is expected to require about 24 months (a total of 515 days of construction).

3.7.6 Other Physical Changes to the Environment

Operational Scenario: Other Physical Changes to the Environment

As previously stated, Program Water is planned to be discharged continuously into Stanfield Marsh. This will occur through a new 12-inch pipe, which will need to be installed from the BBARWA WWTP to the proposed discharge points in Stanfield Marsh, as shown in **Figure 3-2**, which depicts the proposed alignment alternatives for the Big Bear Lake Discharge. The discharge to Stanfield Marsh and subsequent to Big Bear Lake is anticipated to result in an increase of water within Big Bear Lake by up to four and half feet during extremely dry periods. The discharge to Stanfield Marsh also has the potential to support wetland/marsh habitat in a somewhat greater area than is supported under current conditions.

Additionally, the Program would also result in a change at Shay Pond in that, Program Water would be used in place of the existing water source—groundwater—in support of the Stickleback fish. This change is not anticipated to result in a physical change to the environment at or surrounding Shay Pond beyond that the source of water utilized at Shay Pond will be altered.

The Program would also result in about 2,200 AFY less discharge to the LV Site. Thus, the operations at the LV Site would be altered as part of the proposed Program. The total discharge to Lucerne Valley would total about 340 AFY on average the flows, but the flows to the LV Site will vary based on the hydrologic conditions. For example, in a dry year, no water would be sent to the LV Site, and in a wet year, like in 2011, up to 1,050 AFY could be sent to the LV Site. The reduction in discharge would limit the ability to continue the use of the site from an existing use of 190 acres of the 480-acre site, to a utilization of 40 acres of the LV Site for farming purposes. The LV Site would continue to be owned by BBARWA, and BBARWA would ensure that the site maintained.

Construction Scenario: Other Physical Changes to the Environment

No additional construction beyond that which has already been discussed in this Subsection (3.7) is anticipated to occur that would facilitate the other physical changes to the environment described herein.

3.8 ENTITLEMENTS, APPROVALS AND OTHER AGENCY PARTICIPATION

There are a wide range of other agencies that may have an interest in or may be involved in the review and approval of the facilities outlined above. The following list is not intended to be exhaustive, but it provides a sense of the agencies that may participate in the review or approval of this program and specific projects. The potential participating agencies are arranged based on the individual topics contained in the standard CEQA Initial Study Environmental Checklist Form. **Table 2.6-1**, repeated from **Chapter 2**, outlines the other agency approvals that may be necessary to implement the proposed Program.

**Table 2.6-1
 OTHER AGENCY APPROVALS**

Agency	Approvals Necessary
STATE & LOCAL AGENCIES: SWRCB	NOI to the SWRCB for a NPDES general construction stormwater discharge permit. This permit is granted by submittal of an NOI to the SWRCB, but is enforced through a SWPPP that identifies construction BMPs for the site. In Big Bear Valley, the Santa Ana Regional Board enforces the BMP requirements contained in the NPDES permit by ensuring construction activities adequately implement a SWPPP. Implementation of the SWPPP is carried out by the construction contractor under contract to BBARWA, BMWWD, BBLDWP, or BBCCSD, with the Regional Board providing enforcement oversight.
Jurisdictional Waters	The Program includes the potential discharge of fill into or alterations of "waters of the United States," "waters of the State," and stream beds of the State of California. Regulatory permits to allow fill and/or alteration activities due to Program activities such as pipeline installation are likely be required.
USACOE)	<ul style="list-style-type: none"> • A Section 404 permit for the discharge of fill material into "waters of the United States" may be required from the USACOE
Santa Ana Regional Board	<ul style="list-style-type: none"> • A Section 401 Water Quality Certification may be required from the Regional Board
CDFW	<ul style="list-style-type: none"> • 1600 Streambed Alteration Agreement may be required from the CDFW
USFWS CDFW	These agencies may need to be consulted regarding threatened and endangered species documented to occur within an area of potential impact for future individual projects. This could include consultations under the Fish and Wildlife Coordination Act.
San Bernardino County City of Big Bear Lake	Tree removal permits may be required from local jurisdictions; and, San Bernardino County and local jurisdictions must ensure that stormwater discharges from each of the facility sites meet the current MS4.
SCAQMD	Air quality permits may be required from the SCAQMD.
Caltrans San Bernardino County City of Big Bear Lake SBCFCD BVES Southwest Gas	Encroachment permits may be required.

Agency	Approvals Necessary
CAL FIRE	CAL FIRE regulates the removal of clusters of trees pursuant to CAL FIRE timberland conversation regulations. The facilities proposed under this Program are anticipated to either require obtaining an exemption or must submit a TCP pursuant to California Public Resources Code 4621(a) and a THP pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.
Colorado Regional Board	The Colorado Regional Board will issue a modified WDR to BBARWA, as will the Santa Ana Regional Board will issue a WDR and WRR for use of recycled water.
Santa Ana Regional Board	The Santa Ana Regional Board will issue a WDR and WRR for use of recycled water.
California Department of Public Health	The California Department of Public Health must review and approve the future use of recycled water
SBCFCD City of Big Bear Lake FEMA	If any flood hazard areas are affected by the proposed Program, SBCFCD, the City of Big Bear Lake, and FEMA may perform reviews for this Program.
FEDERAL AGENCIES: BOR EPA	The proposed Program has been awarded a grant for the Program from the BOR. The proposed Program may seek grants or loan from other Federal agencies, such as the EPA.

No other reviewing or permitting agencies have been identified.

3.9 CEQA RESPONSIBLE AGENCIES

Partner Agencies

BBCCSD
 BBLDWP
 BBMWD
 Bear Valley Groundwater Sustainability Agency

Other Potential Responsible Agencies

 EPA

3.10 USES OF THIS ENVIRONMENTAL IMPACT REPORT

Before any of the proposed facilities can be implemented, BBARWA must approve the proposed projects and the remaining entities that make up the Program Team and CEQA Responsible Agencies will utilize the DPEIR as CEQA Responsible Agencies. This document has also been prepared in order to meet NEPA standards to enable the BOR and EPA to process this Program under a separate NEPA documentation process.

San Bernardino County, City of Big Bear Lake and/or Caltrans may issue encroachment or development permits for the proposed upgrades and additions to BBARWA's WWTP, proposed recycled water conveyance lines, brine storage basins, monitoring wells, and pump stations. These approvals can rely upon this DPEIR as the basis for compliance with the CEQA. San Bernardino County and the City of Big Bear Lake would also utilize the DPEIR as CEQA Responsible Agencies.

Other agencies listed under **Section 3.9** may use this document as CEQA Responsible Agencies to grant other approvals or entitlements.

CHAPTER 4 – ENVIRONMENTAL IMPACT EVALUATION

4.1 BACKGROUND

BBARWA provides wastewater treatment to the entire Big Bear Valley (79,000 acres). BBARWA, together with the following agencies—BBCCSD, BBLDWP, and BBMWD henceforth referred to jointly as the Program Team—are proposing to implement the Replenish Big Bear Program (Program). The Program Team has prepared a DPEIR to evaluate the potential significant environmental impacts that may result from implementing the Program.

The Program Team has developed a Program to recover a water resource that is currently being transported out of Big Bear Valley to Lucerne Valley, close the water loop, and keep the water in Big Bear Valley for beneficial reuse. The Program has been proposed with the goal of producing Program Water within Big Bear Valley for beneficial use. By doing so, this will provide a ~~supplemental and drought-proof~~ new source of water for current and future Big Bear Valley residents and businesses. The Program incorporates and leverages prior recycled water planning efforts in the region and represents opportunities in the context of current and prospective future regulations.

Currently, wastewater generated within the Big Bear Valley undergoes preliminary and secondary treatment. Treated undisinfected secondary effluent is discharged to BBARWA's 480-acre site in Lucerne Valley (LV Site)—about 20 miles north of the Big Bear Valley and outside the Santa Ana Watershed—for irrigation of fodder and fiber crops that are used as feed for livestock. The LV Site referred to herein is the 480-acre portion of the larger 630-acre BBARWA owned site in Lucerne Valley that is regulated by a Colorado River Basin Regional Water Quality Control Board (Colorado Regional Board) Waste Discharge Permit (WDR). The WDR stipulates that 340 acres of the LV Site can be irrigated with recycled water from BBARWA's Wastewater Treatment Plant (WWTP), with an additional 140 acres available for irrigation utilizing other water sources. Retaining recycled water in the watershed for beneficial use would significantly increase the sustainability of local water supplies. The Program Team has partnered to develop a Program that will retain this water resource in Big Bear Valley for beneficial reuse.

While this DPEIR has been prepared at the programmatic level, due to the fact that Replenish Big Bear is, in and of itself, a Program with many components, project-level detail is provided for nearly every component of this Program. This is because sufficient detail is known for most of the Program facilities to analyze each facility at the project level. The only projects that have not been analyzed at the project level are as follows: the Sand Canyon Monitoring Wells have been analyzed at a more general level because the project sites for the monitoring wells have not yet been selected, though the general locations for the monitoring wells are known to be downstream of the Sand Canyon Recharge Area; and, the change in water source at Shay Pond has been analyzed at a more general level because of the regulatory costs and hurdle that would be necessary to modify the water source supporting the Stickleback. Impacts will be quantitatively addressed in project-specific second tier environmental evaluations once specific aspects of the Program are proposed for implementation and designed. Sufficient detail is known for the remaining projects proposed under this Program to forecast impacts at the project level.

Replenish Big Bear includes permitting, design, and construction of an AWPf at the existing BBARWA WWTP, about 6.59 miles of pipeline for product water and reverse osmosis (RO), brine minimization, three pump stations, a groundwater recharge facility, and up to four monitoring wells. The Program is currently estimated to produce approximately 1,950 acre-feet per year (AFY) of high-quality Program Water, and may produce up to 2,200 AFY by 2040 through

utilization of a high-recovery brine minimization technology. Piloting is currently being conducted to confirm the feasibility of the higher yield estimates. For the purposes of this document, 2,200 AFY is used to be conservative in evaluating environmental impacts.

Furthermore, beyond the Program Objectives, the Program includes the following uses and benefits:

- Sustain Stanfield Marsh Habitat and Increase Educational Opportunities: By providing a consistent water source to Stanfield Marsh through the discharge of Program Water to Stanfield Marsh, the habitat therein would be sustained and educational opportunities for the community and visitors would be created;
- Enhance Big Bear Lake Benefits: The Program would discharge Program Water to Stanfield Marsh, allowing the Program Water to flow through Stanfield Marsh and provide new inflow to Big Bear Lake. The Program will increase inflows and Lake level, thereby enhancing recreational opportunities and aquatic habitat in both Big Bear Lake and Stanfield Marsh, and would support water quality improvements;
- Expand Local Water Supplies: When there is space in the groundwater basin to increase water levels and there is available Program Water stored in Big Bear Lake, Program Water could be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin. The Program Team, in coordination with the Big Bear Watermaster, will negotiate an accounting framework to track the volume of Program Water stored in Big Bear Lake over time, which will account for inputs, extractions, evaporation and releases of Program Water, and will be negotiated with the existing accounting and reporting framework used by the Big Bear Watermaster. This framework is envisioned to include a provision for some Program Water to be stored in Big Bear Lake and subsequently used for recharge in Sand Canyon when conditions are favorable for recharge;
- Sustain Unarmored Threespine Stickleback Fish with Program Water: To sustain the habitat for the Federally listed Unarmored Threespine Stickleback (Stickleback) fish with a new sustainable water source, Program Water will be discharged to Shay Pond in place of potable groundwater. While this part of the Program is included in this DPEIR for analysis purposes, this Program component is not anticipated to be completed in the near term. Therefore, a full analysis was not completed;¹²

The Program includes upgrades and additions to BBARWA's WWTP to produce Program Water, that meets the stringent discharge requirements for Big Bear Lake, particularly for nutrients (specifically TP and TIN) and TDS. To achieve the anticipated effluent limits, BBARWA will need to implement a series of upgrades to the existing unit processes and integrate new unit processes:

- Upgrade the existing oxidation ditches to improve biological nutrient removal process;
- Tertiary filtration and nutrient removal via denitrification filters;
- UF and RO membrane filtration;
- UV/AOP; and
- Brine pellet reactor for brine minimization.

The Program envisions that the Shay Pond Discharge will replace potable water currently discharged to the water body to maintain the water flow through the pond, which is shown in **Figure 3-19**. Up to 80 AFY of Program Water will be sent to Shay Pond, and any remaining Program Water will be

¹² The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Unarmored Threespine Stickleback (*Gasterosteus aculeatus williamsoni*), which is a Federally and state endangered species.

sent to Shay Pond, and any remaining Program Water will be sent to Stanfield Marsh, a tributary of Big Bear Lake. Additionally, when needed, Program Water stored in Big Bear Lake will be pumped to Sand Canyon to recharge the Bear Valley Basin to strengthen the sustainability of the groundwater basin. The facilities envisioned to facilitate the Sand Canyon Recharge Area include a pump station and pipeline that are planned to be sized to convey 380 AF of recharge water over a six-month period.

For redundancy purposes, BBARWA is also seeking to maintain its current discharge location in Lucerne Valley, where undisinfected secondary effluent is currently conveyed to irrigate fodder crops used for livestock feed. All WWTP process water in excess of the upgraded BBARWA WWTP's 2.2 MGD capacity will continue to be treated to undisinfected secondary levels and conveyed to the existing Lucerne Valley site, consistent with the current permitted discharge requirements of the existing BBARWA WWTP.

As the agency that will facilitate the implementation of the WWTP upgrades, BBARWA will serve as the Lead Agency for purposes of complying with CEQA and later NEPA. The Program has been awarded Federal grants, so compliance with NEPA is needed. Therefore, this document has been prepared to meet NEPA standards to enable the BOR and other Federal agencies to process this Program under a separate NEPA documentation process. Thus, BBARWA has prepared the Replenish Big Bear Program DPEIR as the Lead Agency, in cooperation with the Program Team, as responsible agencies. Other agencies that may be Responsible Agencies or Trustee Agencies are listed under **Subsection 3.9 of the Program Description**.

BBARWA has prepared the Replenish Big Bear Program DPEIR that evaluates the potential environmental impacts that would result from constructing and implementing the proposed Program.

This chapter of the DPEIR provides the detailed information used to forecast the type and significance of potential environmental impacts that implementation of the Program and related actions could cause if the Program is implemented as described in Chapter 3, the Program Description.

In the following subchapters, as discussed in the **Introduction, Chapter 2** of this document, each of the 20 topics identified in Appendix G of the State CEQA Guidelines will be analyzed as follows: aesthetics, agriculture and forestry resources, air quality, biological resources, cultural resources, energy, geology/soils, greenhouse gas emissions/climate change, hazards and hazardous materials, hydrology/water quality, land use/planning, mineral resources, noise, population/housing, public services, recreation, transportation, tribal cultural resources, utilities/service systems, and wildfire. The environmental impact analysis section for each environmental topic is arranged in the following manner:

- a. An introduction that summarizes the specific issues of concern for each subchapter, as identified in the NOP scoping process;
- b. A summary of the current or existing environmental setting for each physical resource or human infrastructure system is presented as the baseline from which impacts will be forecast;
- c. Based on stated assumptions and identified criteria or thresholds of significance, the potential direct and indirect impacts of the proposed Program are forecast and the significance of impacts is assessed without applying any mitigation; recommended measures that can be implemented to substantially lessen potential environmental impacts are identified, and their effectiveness in reducing impacts to non-significant levels is described; and, potential cumulative environmental impacts are assessed under each environmental topic, where applicable; and,

- d. Significant and unavoidable environmental impacts and any significant impacts that may be caused by implementing **MMs** are addressed.

To provide the reviewer with a criterion or set of criteria with which to evaluate the significance of potential environmental impacts, this document provides issue specific criteria, i.e., thresholds of significance, for each topic considered in this DPEIR. These criteria are either standard thresholds, established by law or policy (such as ambient air quality standards or thresholds of significance established by the SCAQMD) or project-specific evaluation thresholds used specifically for this Program. After comparing the forecasted physical changes in the environment that may be caused by implementing the proposed Program with the issue specific significance threshold criterion or criteria, a conclusion is reached on whether the proposed Program has the potential to cause a significant environmental impact for the issue being evaluated.

Where appropriate and feasible, measures to reduce potential significant environmental impacts are identified and described in this section of the DPEIR. Over the past several years, mitigation has evolved in scope and complexity. As environmental issues are addressed in a progressive and adaptive manner, previous measures developed to mitigate project specific impacts are eventually integrated into local, regional, State and Federal statutes, rules and regulations, such as the Uniform Building Code or Water Quality Management Plans. **MMs** that are incorporated into statutes or rules and regulations become mandatory requirements (not discretionary) and they no longer need to be identified as discretionary **MMs** applicable to the Program, although they are often referenced to demonstrate that identified environmental impacts can and will be mitigated.

The text in the following subchapters summarizes all of the various measures anticipated to be incorporated into the Program to reduce potential significant environmental effects, either to the extent feasible or to a level of less than significant. After determining the degree of mitigation that can be achieved by the proposed measures and after identifying any potential adverse impacts that the **MMs** may cause, a conclusion is provided regarding the remaining level of impact, such as less than significant and/or unavoidable significant adverse impact for each environmental topic, if any.

To the extent feasible, this document utilizes conservative (worst case) assumptions in making impact forecasts based on the assumption that, if impacts cannot be absolutely quantified, the impact forecasts should over-predict consequences rather than under-predict them. The many technical studies that were prepared for this document are incorporated into this chapter by summarizing the technical information to ensure technical accuracy. The Program NOP was distributed to the public and through the State Clearinghouse on November 30, 2022. The publication of the NOP established the date for all baseline information contained in this document. The various technical studies prepared in support of this DPEIR were all compiled and completed concurrent with or after the baseline date of November 30, 2022 and all analysis in the DPEIR was compiled subsequent to this date.

These technical studies themselves are compiled in a separate volume of the DPEIR (Volume 2), which will be distributed in electronic form and made available to all parties upon request. The information used and analyses performed to make impact forecasts are provided in depth in this document to allow reviewers to follow a chain of logic for each impact conclusion and to allow the reader to reach independent conclusions regarding the significance of the potential impacts described in the following subchapters.

4.2 AESTHETICS

4.2.1 Introduction

This section assesses potential aesthetic impacts from implementation of the Replenish Big Bear Program (Program).

The analysis herein, while prepared under a Programmatic Draft Environmental Impact Report (DEIR), has been provided as the project level for all of the facilities proposed under this Program, with one exception: the monitoring wells at Sand Canyon. Sufficient detail for all other projects proposed under this Program is available for project level impact forecasts.

These issues will be discussed below as set in the following framework:

- Introduction
- Environmental Setting: Aesthetics
- Regulatory Setting
- Thresholds of Significance
- Potential Impacts
- Cumulative Impacts
- Unavoidable Adverse Impacts

No comments pertaining to aesthetics resources were received in response to the NOP, and none were received at the Scoping Meeting held on behalf of the Program.

4.2.2 Environmental Setting: Aesthetics

Big Bear Valley is located in the San Bernardino Mountains of San Bernardino County, California. The area includes approximately 135 square miles within a 12-mile-long valley surrounded by mountain ridges and rugged slopes. Land surface elevations range from about 6,000 to 9,900 ft amsl and the area is entirely surrounded by the San Bernardino National Forest. The proposed Program is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake (dry lakebed) are located in the middle of this Basin. The overall Program Area consists of Big Bear Valley floor and adjacent lower elevation slopes. The BBARWA sewer service area and Big Bear Valley potable water service areas are shown on **Figure 3-1** to illustrate the regional context of the proposed Program. Additionally, **Figure 3-29** illustrates an aerial view outlining an overview of the Program. The Program will span just east of Big Bear Lake to the WWTP at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the southeast to the Resort Storage Pond and Sand Canyon Recharge Area.

While no physical components of the Program are located in Lucerne Valley, an unincorporated community in San Bernardino County Mojave Desert, the Program would reduce the flow of wastewater discharge to Lucerne Valley by up to 2,200 AFY. Thus, impacts resulting from that reduced flow must be analyzed in this DPEIR. As such, the environmental setting of the area receiving flow from BBARWA—the LV Site—is detailed herein.

As described in Chapter 3, Program Description of this DPEIR, the LV Site referred to herein is the 480-acre portion of the larger 630-acre BBARWA owned site in Lucerne Valley that is located near the intersection of Camp Rock Road and Highway 247 (Old Woman Springs Road) in Lucerne Valley, CA, as shown in **Figure 4.2-1**. The site is presently flat, with the only nearby scenic resources being the San Bernardino Mountains to the south. The LV Site has been in

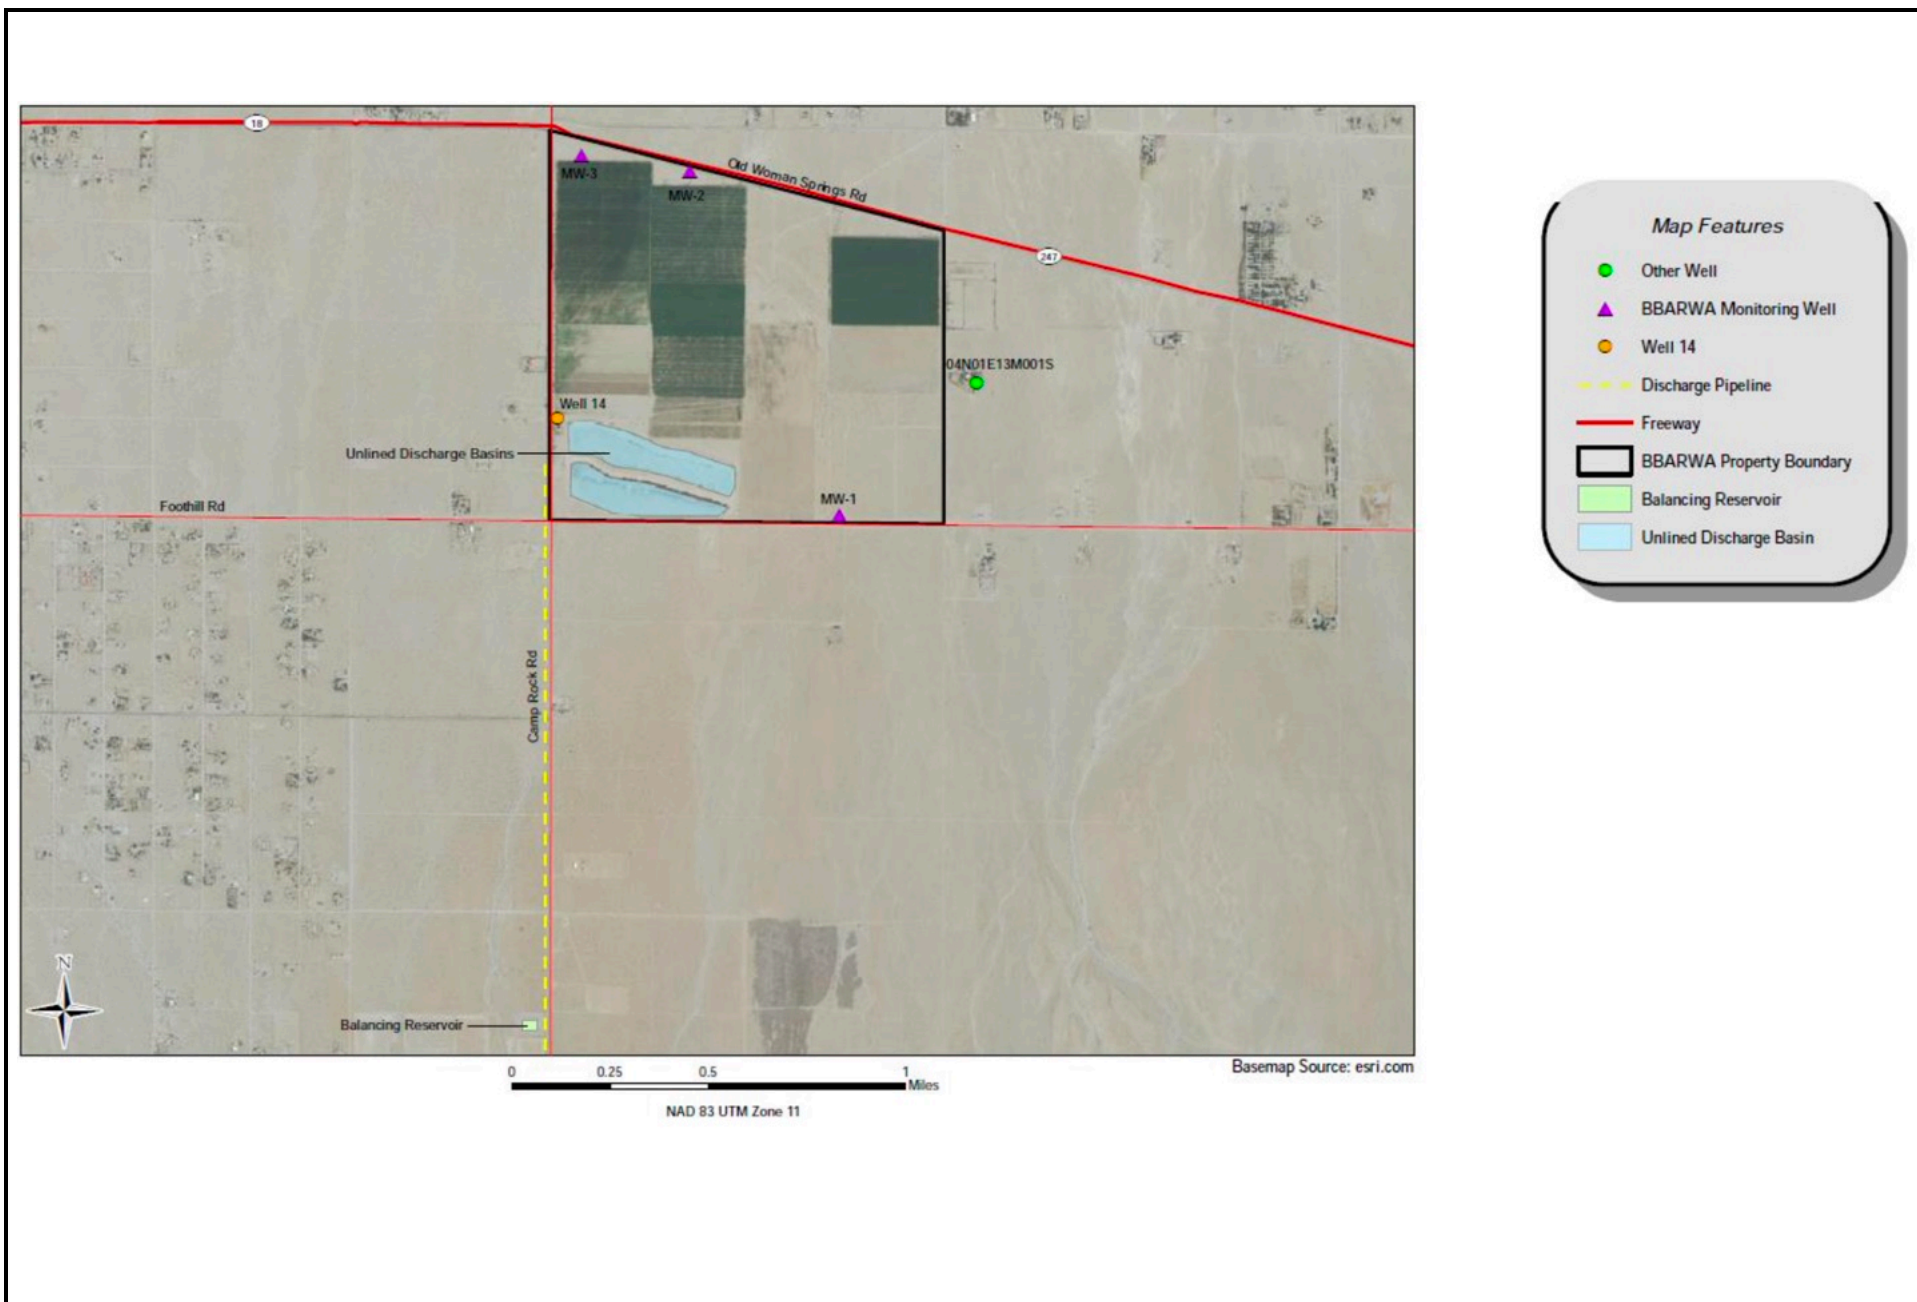

FIGURE 4.2-1

operation as a farm since 1980 and is operated by a local farmer who leases the land from BBARWA. Alfalfa and a grain mixture consisting of barley, oat and wheat crops are grown onsite and sold as feed for animals not producing milk for human consumption. Historically, up to 330 acres of the site has been farmed; however, the farmed area was reduced in 2012 to only 190 acres due to reduced water availability associated with drought conditions. The current farmed area, in recent years, has remained at 190 acres with no plans to increase the acreage in the future. In 2022, the LV Site was not farmed, but the farmer intends to continue the farming operation in 2023 for the foreseeable future.

4.2.2.1 Scenic Resources

Big Bear Valley is surrounded by mountain and lake views created by unique, complex, and dramatic geological forces affecting Big Bear Valley. Visual resources of significance in Big Bear Valley include the surrounding mountain ridges, Big Bear Lake, Stanfield Marsh, and other natural water courses, including Caribou, Metcalf, North, Rathbun, Shay, Sand, and Mill Creeks. Major plant communities in Big Bear Valley include chaparral, various scrubs (e.g., sage, riparian, desert), deciduous woodlands, conifer forests, and wetlands. Generally, the visual character of Big Bear Valley includes forested landscape, prominent ridgelines, and steep canyons interspersed with small communities, valleys, and lakes. This setting contributes significantly to Big Bear Valley's economic health and continued growth.

Big Bear Valley is surrounded by SBNF, which is home to the deciduous woodland and conifer forest vegetation communities that are important to the character and visual setting of Big Bear Valley. Baldwin Lake is all that naturally remains of a once enormous lake that covered Big Bear Valley during the Ice Age. Clay deposits that were left behind in the Big Bear and Holcomb Valleys are too hot and dry in the summer months for pine and other large tree seedlings to grow. These clay soil areas covered with alpine plants are called the "Pebble Plains" due to the layer of orange and white quartzite pebbles at the surface of the clay.¹³ The San Bernardino Mountains that surround Big Bear Valley are home to the only Pebble Plain communities in the world, and as such, the Pebble Plains are considered an important visual and biological resource within Big Bear Valley. The 156-acre Baldwin Lake Ecological Reserve, located in the northern portion of the Baldwin Lake area as shown on **Figure 4.2-2**, includes a unique pebble plain plant community as well as vernal wet meadow habitat. The site is also significant for its wintering population of bald eagles and is protected by CDFW. An example of the Pebble plain shooting star (pebble plain short morph) (*Dodecatheon hendersonii*) is shown in **Photo 4.2-1**, below.

The LV Site is presently flat, with the only nearby scenic resources being the San Bernardino Mountains to the south and the Newberry, Rodman, and Fry Mountains that bound the Lucerne Valley to the north and east. Refer to **Photo 4.2-5**, below.

State Scenic Highways

California's Scenic Highway Program designates scenic highways with the intention of protecting these corridors from change that would diminish the aesthetic value of adjacent lands. A highway is designated as an eligible scenic highway when Caltrans determines that the roadway corridor qualifies for official status. The status of an officially designated scenic highway changes when the local governing body applies to Caltrans for scenic highway approval, adopts a Corridor Protection Program, and receives notification that the highway has been officially designated. Scenic highways must have an approved Corridor Protection Program and remain in compliance to maintain scenic highway status. According to the Caltrans State Scenic Highway Map (**Figure 4.2-3**) and the San Bernardino Countywide Plan, State Route (SR) 38 (also known as the Rim of the World Scenic Byway) is designated as both a State and County Scenic Highway south of State Lane.¹⁵ Big Bear Boulevard is considered Eligible State Scenic Highway, while SR-330 and SR-18 are considered designated County Scenic Routes and Eligible State Scenic Highways. No other State or County Scenic Highways exist in the Program vicinity.

4.2.3 Regulatory Setting

State and local laws, regulations, plans, or guidelines that are applicable to the proposed Program are summarized below.

4.2.3.1 State

State Scenic Highway Program

Caltrans defines a scenic highway as any freeway, highway, road, or other public ROW, that traverses an area of exceptional scenic quality. As previously stated, according to the Caltrans State Scenic Highway Map, these SRs, include the following designated State Scenic Highways in Big Bear Valley: SR-18.

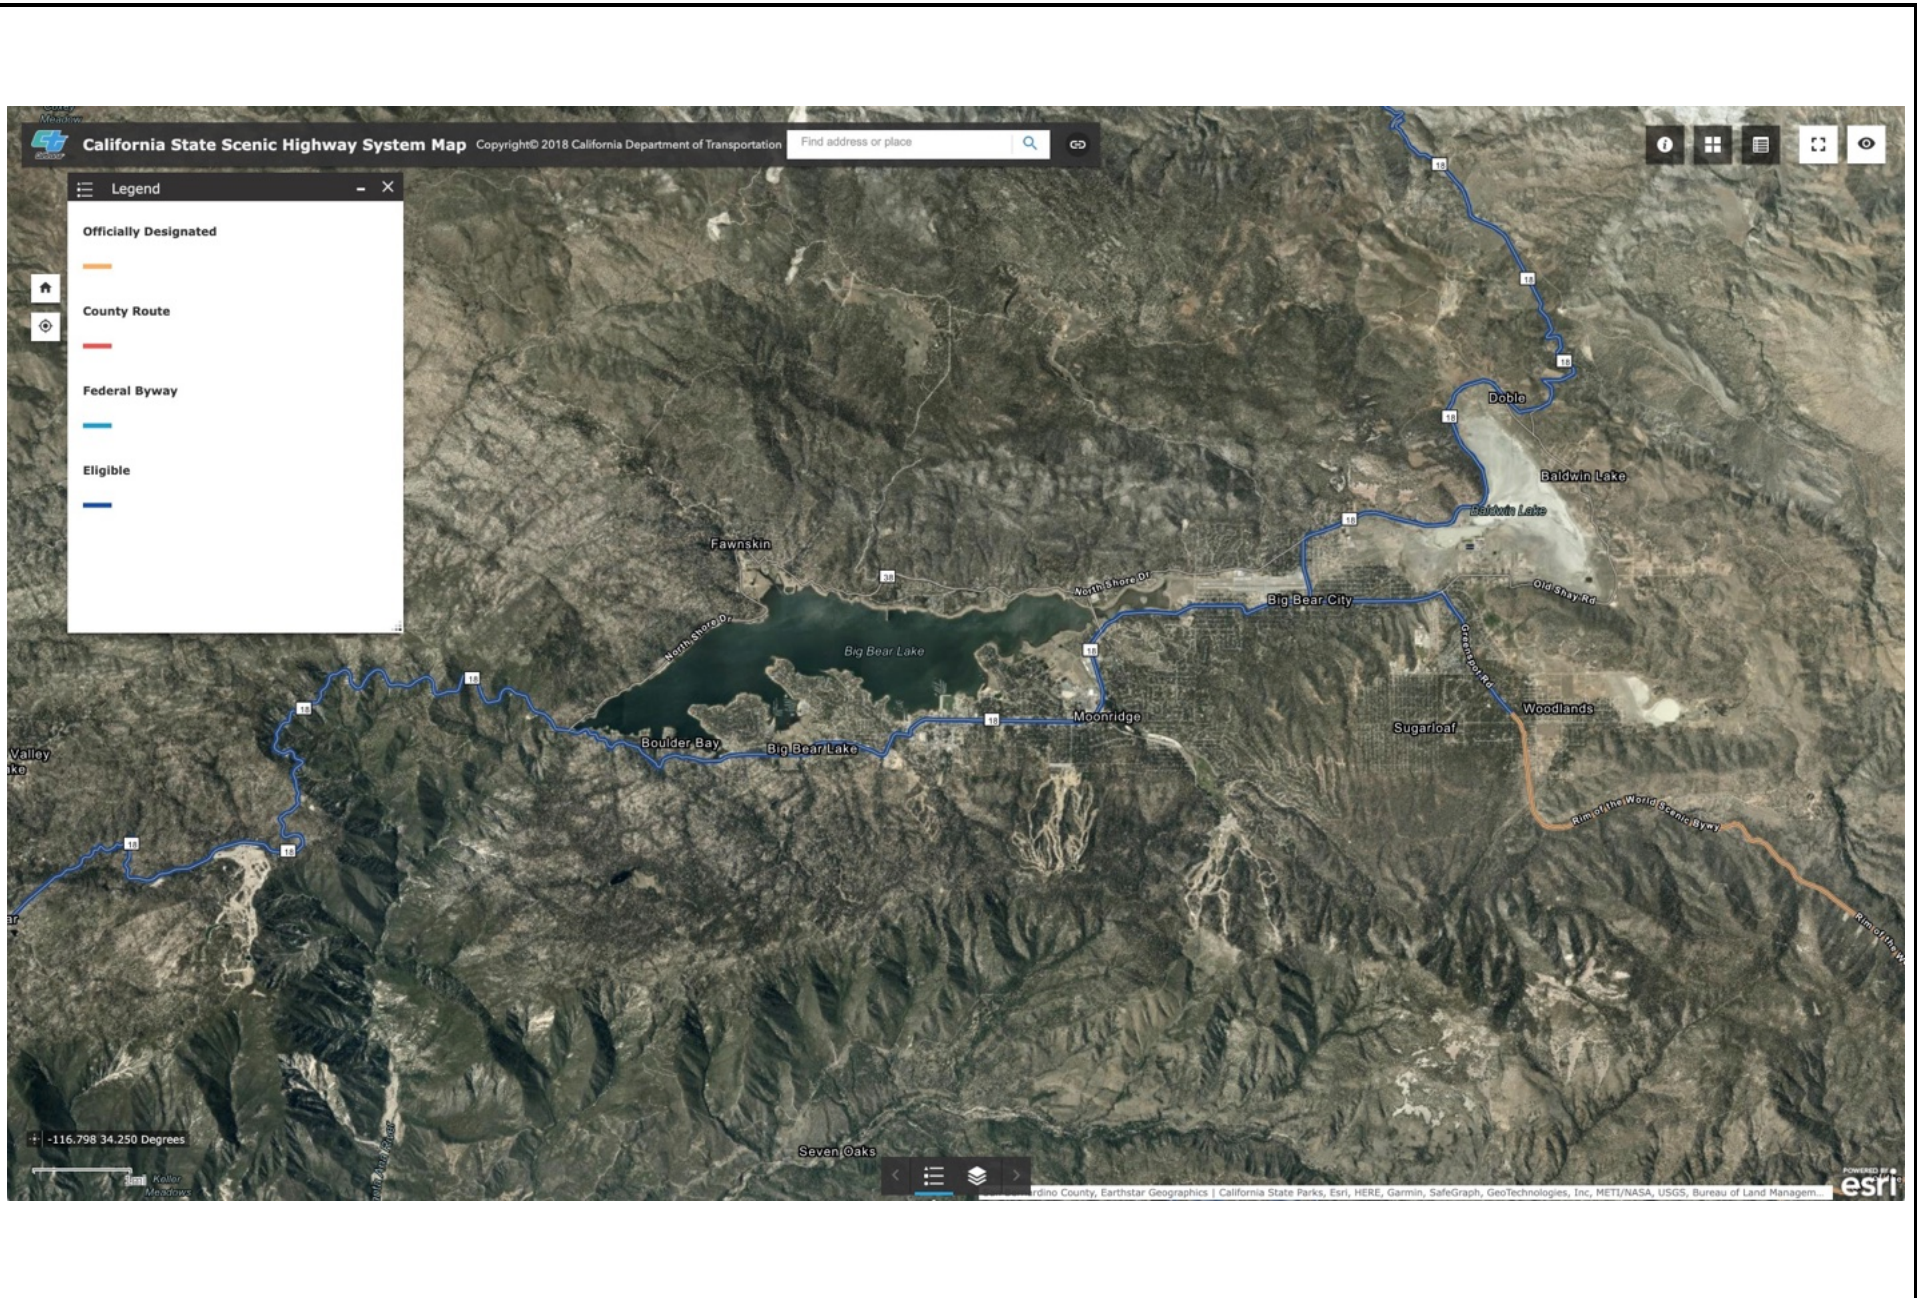

FIGURE 4.2-3

4.2.3.2 Local

Big Bear Valley encompasses the jurisdiction of unincorporated areas of San Bernardino County, including the following unincorporated communities in the vicinity of the Program: Big Bear City, Moonridge, and Fawnskin, and the City of Big Bear Lake. The City of Big Bear Lake and San Bernardino County have their own General Plan and municipal code that identify goals and policies regarding preservation of scenic resources.

San Bernardino Countywide Plan

The San Bernardino Countywide Plan has the following Land Use and Natural Resources Element goals and policies that relate to aesthetics, including:

Goal LU-4 Preservation and enhancement of unique community identities and their relationship with the natural environment

Policy LU-4.1 Context-sensitive design in the Mountain/Desert regions
We require new development to employ site and building design techniques and use building materials that reflect the natural mountain or desert environment and preserve scenic resources.

Goal NR-4 Scenic resources that highlight the natural environment and reinforce the identity of local communities and the county.

Policy NR-4.1 Preservation of scenic resources
We consider the location and scale of development to preserve regionally significant scenic vistas and natural features, including prominent hillsides, ridgelines, dominant landforms, and reservoirs.

NR-4.2 Coordination with agencies
We coordinate with adjacent federal, state, local, and tribal agencies to protect scenic resources that extend beyond the County's land use authority and are important to countywide residents, businesses, and tourists.

NR-4.3 Off-site signage
We prohibit new off-site signage and encourage the removal of existing off-site signage along or within view of County Scenic Routes and State Scenic Highways.

Goal NR-5 An interconnected landscape of open spaces and habitat areas that promotes biodiversity and healthy ecosystems, both for their intrinsic value and for the value placed on them by residents and visitors.

Policy NR-5.3 Multiple-resource benefits
We prioritize conservation actions that demonstrate multiple resource preservation benefits, such as biology, climate change adaptation and resiliency, hydrology, cultural, scenic, and community character.

San Bernardino County Development Code

§ 88.01.050 Native Tree or Plant Removal Permits.

(a) When Tree or Plant Removal Permit Required. A Tree or Plant Removal Permit shall be required for the removal of a regulated tree or plant as identified in this Chapter.

- (1) Removals in Conjunction with Land Use Application or Development Permit - Director Approval. The Director may approve the removal of regulated trees or plants when requested in conjunction with a land use application, a Building Permit, and all other development permits

- (e.g., Grading Permits, Mobile Home Setdown Permits, etc.). An approved land use application and/or development permit shall be considered to include a Tree or Plant Removal Permit, if the land use application or development permit specifically reviews and approves the removals. The review of a land use application or development permit shall consider and require compliance with this Chapter.
- (2) Removals Not in Conjunction with Land Use Application or Development Permit - Director Approval. The Director may approve a Tree or Plant Removal Permit for the removal of regulated trees or plants requested not in conjunction with a land use application or development permit.
- (f) Findings for Tree or Plant Removal Permits. The applicable review authority may authorize the removal of a regulated tree or plant only if the following findings are made:
- (1) Findings for Removals in the Valley Region, Mountain Region, and Desert Region. The removal of the regulated tree or plant is justified for one of the following reasons:
- (A) The location of the regulated tree or plant and/or its dripline interferes with an allowed structure, sewage disposal area, paved area, or other approved improvement or ground disturbing activity and there is no other alternative feasible location for the improvement.
- (B) The location of the regulated tree or plant and/or its dripline interferes with the planned improvement of a street or development of an approved access to the subject or adjoining private property and there is no other alternative feasible location for the improvement.
- (C) The location of the regulated tree or plant is hazardous to pedestrian or vehicular travel or safety.
- (D) The regulated tree or plant or its presence interferes with or is causing extensive damage to utility services or facilities, roadways, sidewalks, curbs, gutters, pavement, sewer line(s), drainage or flood control improvements, foundations, existing structures, or municipal improvements.
- (E) The condition or location of the regulated tree or plant is adjacent to and in such close proximity to an existing or proposed structure that the regulated tree or plant has or will sustain significant damage.
- (2) Additional Findings for Removals in the Mountain Region. In the Mountain Region only, the applicable review authority shall also make all of the following findings:
- (A) Where improvements are proposed, the design of the improvements ensures that at least the following minimum percentage of the subject parcel will be maintained or established in a natural undeveloped vegetated or revegetated condition sufficient to ensure vegetative coverage for a forest environment, as determined by the applicable Review Authority.
- (I) Twenty percent of commercial, industrial, and administrative/ professional uses.
- (II) Thirty-five percent of multi-family residential uses.
- (B) At least one half of natural areas for all uses, except single-family residential uses, will be located in the front setback area or located so that significant portions are visible from the public right-of-way on which the improvements are to be located.
- (C) A perch tree within a federally identified American Bald Eagle habitat will not be removed unless an adequate substitution is provided.
- (D) A Registered Professional Forester has certified in writing that the condition or location of a regulated tree is contributing to overstocked tree stand conditions and that its removal will improve the overall health, safety, and vigor of the stand of trees containing the subject tree.
- (3) In the Desert Region only, the applicable Review Authority shall also make the following findings:
- (A) Joshua trees that are proposed to be removed will be transplanted or stockpiled for future transplanting wherever possible.
- (B) In the instance of stockpiling, the permittee has complied with Department policy to ensure that Joshua trees are transplanted appropriately. Transplanting shall comply with the provisions of the Desert Native Plants Act (Food and Agricultural Code §§ 80001 et seq.), as required by § 88.01.060(d) (Compliance with Desert Native Plants Act).

- (C) No other reasonable alternative exists for the development of the land when the removal of specimen size Joshua Trees is requested. Specimen size trees are defined as meeting one or more of the following criteria:
 - (I) A circumference measurement equal to or greater than 50 inches measured at four and one-half feet above natural grade level.
 - (II) Total tree height of 15 feet or greater.
 - (III) Trees possessing a bark-like trunk.
 - (IV) A cluster of ten or more individual trees, of any size, growing in close proximity to each other.
- (g) Plot Plan Requirements. Before the issuance of a Tree or Plant Removal Permit, a plot plan shall be approved by the applicable Review Authority for each site indicating exactly which trees or plants are authorized to be removed. The required information shall be added to any other required plot plan.
- (h) Construction Standards. During construction and before final inspection under a development permit, the following construction standards shall apply, unless otherwise approved in writing by an arborist, registered professional forester, or a Desert Native Plant Expert:
 - (1) Enclosures. The trunks of regulated trees and regulated plants shall not be enclosed within rooflines or decking.
 - (2) Attachments. Utilities, construction signs, or other hardware shall not be attached so as to penetrate or abrade any live regulated tree or plant.
 - (3) Grade Alterations. No grade alterations shall bury any portion of a regulated tree or plant or significantly undercut the root system within the dripline.

§ 88.01.070 Mountain Forest and Valley Tree Conservation.

This Section provides regulations to promote conservation and wise use of forest resources in the Mountain Region and native tree resources in the Valley Region. The provisions are intended to augment and coordinate with the Z'berg-Nejedly Forest Practice Act of 1973 (Public Resources Code §§ 4526 et seq.) and the efforts of the State Department of Forestry and Fire Protection to implement and enforce the Act.

- (a) Applicability.
 - (1) Private Harvesting. The provisions of this Section apply to the private harvesting of all trees growing on private land and on public land in the unincorporated Mountain Region and Valley Region.
 - (2) Commercial Harvesting. The commercial harvesting of trees shall be prohibited, except as allowed by and authorized by the State Department of Forestry and Fire Protection in compliance with the Z'berg-Nejedly Forest Practice Act of 1973 (Public Resources Code §§ 4526 et seq.).
- (b) Regulated Trees. The following trees shall only be removed with an approved Tree or Plant Removal Permit issued in compliance with § 88.01.050 (Tree or Plant Removal Permits):
 - (1) Native Trees. A living, native tree with a six inch or greater stem diameter or 19 inches in circumference measured four and one-half feet above natural grade level.
 - (2) Palm Trees. Three or more palm trees in linear plantings, which are 50 feet or greater in length within established windrows or parkway plantings, shall be considered to be heritage trees and shall be subject to the provisions of this Chapter regarding native trees.
- (c) Tree Protection from Insects and Disease. For regulations on the treatment and disposition of felled trees, see § 88.01.090 (Tree Protection from Insects and Disease).

City of Big Bear Lake General Plan

The City of Big Bear Lake General Plan Open Space and Recreation and Land Use Elements have the following goal and policies that relate to aesthetics, including:

- | | | |
|-------------|------------|--|
| Goal | L 1 | Create a vision for development of the City which provides for orderly, functional patterns of land uses, sensitive to the natural environment and meeting the long-term social and economic needs of the community. |
|-------------|------------|--|

- Policy** L 1.8 Preserve the scenic mountain backdrop of Big Bear Lake through adoption of guidelines for hillside development, including the following:
- a. Development in hillside areas should minimize grading, conform to natural topography, preserve ridgelines and exhibit sensitivity to natural landforms.
 - b. Development should be restricted on natural slopes of fifty percent and greater.
 - c. Visually prominent ridges and hillsides should be retained in a natural condition; where hillside grading occurs, the final graded contours should match and blend with natural contours and slopes should be finished in a manner to resemble natural topography.
- Goal** OPR3 Preservation of open space areas within the City that are necessary to protect critical habitat areas, protect scenic views, provide passive recreational opportunities and/or enhance the aesthetic character of the community.
- Policy** OPR 3.4 Consider the acquisition of property as open space if the property would meet the City's land use and environmental goals, and if such action would meet one or more of the following criteria:
- a. The property is located within a scenic viewshed or corridor, and its preservation as open space would provide an aesthetic value to the community and/or the surrounding neighborhood;
 - b. The property is the site of sensitive or protected habitat or species, and its preservation as open space would preserve important biological resources;
 - c. The property provides access and/or views to Big Bear Lake, and its preservation as open space would enhance public use and/or appreciation of the Lake;
 - d. The property provides an important corridor linking habitat or resource areas, such as a drainage course, a wildlife corridor, a regional trail system, or other similar feature.

City of Big Bear Lake Municipal Code

17.10.045 - Tree conservation requirements during construction.

- A. The following tree protection guidelines shall be incorporated as construction notes into all building plans for major projects including but not limited to the following: site, grading, street improvement, curb, gutter and sidewalk, water quality, drainage, public and private utilities, and any plan that proposes construction that may have an impact on trees to be protected.
- B. All construction plans impacting a tree identified to be retained in the TMP must be approved by a State of California licensed landscape architect, California Registered Forrester or arborist certified by the Western Chapter of the International Society of Arboriculture (ISA).
- C. A pre-construction meeting shall be conducted by the building and safety division prior to commencement of any construction on a site with any existing trees of twelve (12) inches DBH or greater, and the provisions of this section shall be reviewed with the contractor. The contractor shall be required to verify in writing that he/she was notified of the tree conservation requirements prior to commencing construction. If the applicant wishes to deviate from city requirements based on the recommendations of a California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture, then the applicant may include the California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture at the meeting. The project landscape architect or arborist shall also attend the pre-construction meeting conducted by the building and safety division and is required to visit the site prior to any trenching or grading activities to verify compliance with the TPM.
- D. Erosion and sedimentation control barriers shall be installed or maintained in a manner which does not result in soil build-up within the critical root zone (CRZ) as defined by Section 17.10.020(E) of the Development Code.
- E. All trees shown to be retained in the TMP shall be protected during construction with chain link fencing, snow fence or fencing of equal, protective value.

- F. Tree protection fences shall be installed prior to the pre-construction meeting and the commencement of any site preparation work (clearing, grubbing, or grading) and shall be maintained throughout all phases of the construction project.
- G. Fences shall completely surround the tree or clusters of trees and be located at the limits of the drip line as defined by Section 17.10.020(K) of the Development Code. In no case shall less than sixty percent (60%) of the CRZ be left unprotected.
- H. Fences shall be maintained throughout the construction project in order to protect the following:
 - 1. Soil compaction in the drip line areas resulting from vehicular traffic or storage of equipment or material.
 - 2. Disturbances within the drip line areas due to grade changes or trenching not reviewed and authorized by the City of Big Bear Lake.
 - 3. Wounds to exposed roots, trunk, or limbs by mechanical equipment.
 - 4. Other activities detrimental to trees such as chemical storage, concrete truck cleaning, and fires.
- I. Exceptions to installing tree fences at the tree drip line may be permitted in the following cases if a four-inch layer of organic mulch is placed within the drip line of the tree and the plan is approved by a California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture:
 - 1. Where trees are close to proposed buildings.
 - 2. Where there are severe space constraints such as building size or other special requirements.
 - 3. Where any of the above exceptions result in areas of unprotected root zones those areas should be covered with four inches of organic mulch to minimize soil compaction.
- M. If possible, all grading within drip line areas shall be done by hand or with small equipment to minimize root damage prior to grading.
- N. Any roots exposed by construction activity shall be pruned flush with the soil and backfilled with good quality topsoil within one day. If exposed root areas cannot be backfilled within one day, an organic material which reduces soil temperature and minimizes water loss due to evaporation shall be placed to cover the roots until backfill can occur.
- O. Prior to excavation or grade cutting within the CRZ or drip line areas, a clean cut shall be made with a rock saw or similar equipment in a location and to a depth approved by the project landscaper or arborist to minimize damage to remaining roots.
- P. Trees most heavily impacted by construction activities shall be watered deeply once a week with a minimum of five gallons per inch of tree diameter applied at the drip line during periods of hot, dry weather including but not limited to the months of June through October.
- Q. When installing concrete within the CRZ or drip line area, a plastic vapor barrier shall be placed underneath the concrete to prohibit the leaching of lime.
- R. Any trenching required for the installation of landscape irrigation, on and offsite utilities, drainage lines, underground vaults and structures shall whenever possible be located outside the CRZ. In no case shall more than sixty percent (60%) of the CRZ be disturbed.
- S. No landscape topsoil dressing greater than four inches shall be permitted within the CRZ. No topsoil is permitted on root flares of any tree.
- T. Pruning to provide clearance for structures, vehicular traffic, and construction equipment shall take place before construction begins. All pruning must be done according to the standards as outlined in literature provided by the International Society of Arboriculture (ISA Pruning Techniques).
- U. The city has the authority to modify the tree protection plan before or during construction.
- V. Trees approved for removal shall be removed in a manner which does not impact trees to be preserved.
- W. Deviations from the above requirements and negligent damage to trees may be subject to a stop work order and/or subject to revised landscape plan approval as proscribed by Section 17.10.030(D) and (E) of the Development Code.
- X. If any of the trees required to be retained or planted as part of the approved landscaping plan should die within a period of forty-eight (48) months after completion of the activities associated with land disturbance, the owner of the property shall replace the trees within six months at a ratio of one-to-one with an approved tree having a diameter of three to four inches measured at a point one foot above natural grade.
- Y. For multi-family, commercial, and industrial projects only: The city may require surety in the form of a bond or other method as approved by the city planner and city attorney, to ensure that trees to be

preserved and/or planted on the site are protected during construction, and remain viable and healthy for twenty-four (24) months after issuance of a final certificate of occupancy.

17.10.050 - Development requirements for minor projects.

- A. Plan Submittal Requirements. For minor projects involving building, grading, paving and/or demolition permits which do not require planning commission approval, and which have the potential to impact or cause removal of existing trees twelve (12) inches or greater DBH, the grading and/or construction plans shall show the following information:
1. The location, base elevation, DBH, species, condition, and critical root zone of all existing trees, which will be affected by the limits of construction. For purposes of this section, the limits of construction shall include any equipment or materials storage areas and/or temporary drive aisles, utility trenching, and other associated activities. All trees affected by proposed construction, both on the subject site and adjacent properties, shall be shown on the plan.
 2. Indication of which trees are proposed for removal and which trees are proposed to remain.
 3. Locations of proposed structures, paving, utilities, and areas to be protected, in relation to trees.
 4. Any proposed grade changes within the drip line of trees to remain, and how trees will be protected from changes in grade through use of permanent tree protection devices.
- B. Plan Review Standards. In approving grading and construction plans proposing to remove or impact existing trees twelve (12) DBH or greater, the reviewing authority shall ensure that the following conservation measures are shown on the plans:
1. Site shall be designed so as to avoid removal of existing healthy trees, where feasible. Where some tree removal is necessary to accommodate the proposed development, consideration should be given to conserving significant stands of trees, healthy trees, trees of varying species and ages, and trees which due to their size, shape, location and/or appearance are considered to be significant.
 2. Tree locations should be reviewed in relation to planned roads, driveways, pavement, structures, overhead utility lines and underground utility trenches, to ensure that trees will not be damaged by construction or development. If the root system of any existing tree will be significantly damaged during construction, or if the tree at maturity will conflict with structures, the site should be redesigned or the tree should be removed. At least sixty percent (60%) of the critical root zone should remain undisturbed from construction for any tree proposed to remain on site.
 3. With the recommendation of a California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture, new and existing trees may be enclosed within rooflines or decking, to avoid future structural damage or injury to the tree. Any recommendations of a California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture regarding the size, type, or location to ensure viability of such trees shall be included into the project approval.
 4. The base of a tree should not be paved over or encased in planters or other enclosures, which would change the grade at the base of the tree.
 5. Grading or landscaping techniques that involve backfilling soil around trees is not allowed. The original grade should be maintained within the drip line of existing trees.
 6. The design of structures, improvements and site grades should conform to the natural topography of the site to the extent feasible, to ensure survival of remaining trees.
 7. When possible, no paving should be allowed within a distance from the base of the tree of four feet or the diameter of the tree (DBH), whichever is greater. Within the drip line, if a hard surface is required, use of porous materials such as bricks, pavers or other pervious materials should be used.
 8. Every effort should be made to install utility trenches outside the critical root zones. Trenches are to be backfilled as soon as possible.
 9. Where deemed appropriate by the reviewing authority, a condition of approval requiring tree replacement may be applied to the permit in order to achieve the objectives of this chapter.
- C. Tree Conservation During Construction. In order to ensure tree conservation during construction or grading for ministerial projects, the provisions of Section 17.10.45, tree conservation during construction, of this chapter shall be noted on the grading and construction plans.

- D. Approval by Reviewing Authority. Plans submitted pursuant to this section may be approved by the reviewing authority upon finding that:
1. The plans contain all information required by this section; and
 2. The plans comply with the conservation requirements of this section.

17.10.060 - Tree removal permit.

- A. Except as specified in Paragraphs (E) and (F) of this section, in cases where there is no approval of a discretionary project or a ministerial project, but where removal of one or more trees twelve (12) inches or greater DBH is proposed, the property owner or authorized representative shall be required to obtain a tree removal permit from the City of Big Bear Lake. Approval of discretionary or ministerial projects, which include review of tree conservation plans, shall constitute the tree removal approval and no separate tree removal permit shall be required in these cases.
- B. In cases where removal of one or more healthy trees twelve (12) inches or greater in diameter is proposed for reasons other than those listed in Paragraphs (E) or (F) of this section, the applicant for a tree removal permit shall provide the following information to the city planning division:
1. The address and assessor's parcel number of the property;
 2. Proof of property ownership, or the permission of the property owner to remove the tree(s);
 3. The number, general location, DBH, species and general condition of each tree proposed for removal;
 4. Photographs of each tree proposed for removal;
 5. A written explanation stating the reason for the proposed tree removal;
 6. The required fee as established by city council.
- C. The request for a tree removal permit shall be evaluated by the city planner or his/her designee, and shall be approved if all of the following findings can be made:
1. The tree removal is reasonable and beneficial because such removal conforms to policies of the general plan and this chapter, and promotes public health, safety and welfare;
 2. The tree removal will not substantially diminish the overall forest canopy within the vicinity or significantly change the character of the site from that of a mountain environment, such that the purpose and intent of this chapter as set forth in Section 17.10.010 can be met on the site if the permit is granted;
 3. The tree removal will not affect an eagle perch tree; and
 4. An approved tree having a diameter of three to four inches measured at a point one foot above natural grade will be planted on the site for each tree removed, where deemed appropriate by the reviewing authority.
- D. Conditions of approval may be applied to a tree removal permit to ensure that the tree is removed and treated in accordance with recommended practices.
- E. When it has been determined by the Big Bear Lake Fire Protection District or the California Department of Forestry that a tree should be removed because it is in decline, is infested or diseased, has died, is structurally unsound, or poses a threat to buildings, life, safety, and/or property, the fire protection district shall provide written notification to the planning division, which shall serve as a tree removal permit for the property owner, and no fee will be assessed for a tree removal permit in these cases.
- F. When it has been determined by a California Registered Professional Forester or an arborist certified by the Western Chapter of the International Society of Arboriculture or California Department of Forestry that a tree should be removed because it is in decline, is infested or diseased, has died, is structurally unsound, or poses a threat to buildings, life, safety, and/or property, the property owner shall provide documentation of such determination to the City, which shall serve as a tree removal permit and no fee shall be assessed for a tree removal permit in these cases.

4.2.4 Thresholds of Significance

According to Appendix G, Section I of the State CEQA Guidelines, a project would normally have a significant effect on the environment if the project would:

- a) Have a substantial adverse effect on a scenic vista;
- b) Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;

- c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings; in an urbanized area, conflict with applicable zoning and other regulations governing scenic quality; or
- d) Create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area.

4.2.5 Potential Impacts

This section evaluates the potential aesthetic impacts of the proposed Program.

a) Would the project have a substantial adverse effect on a scenic vista?

Program Category 1: Conveyance Pipelines

Construction: The construction of the proposed facilities would require temporary ground-disturbance within the project sites. The presence of construction equipment and related construction materials would be visible from public vantage points such as open space areas public ROWs such as roadways and sidewalks. Construction of the proposed facilities could be visible from areas with sensitive viewers; however, construction impacts related to aesthetics would be temporary and short-term in nature (a maximum of 370 days of construction for Conveyance Facilities). As construction would only occur for a short duration, it would not result in a permanent change to the environment beyond that which is discussed below as a result of operation of the proposed facilities. Furthermore, construction activities are routine within urban and suburban areas, and therefore do not typically constitute a significant aesthetic or scenic vista impact. Thus, construction activities associated with implementation of the proposed Program would result in a less than significant impact to scenic vistas in the area.

Operation: The proposed pipelines would be underground and would not be visible once constructed. Thus, regardless of the location within the Big Bear Valley, the conveyance pipelines would not impact any of the visual resources of significance in Big Bear Valley, which include the surrounding mountain ridges, Big Bear Lake, Stanfield Marsh, and other natural water courses, including Caribou, Metcalf, North, Rathbun, Shay, Sand, and Mill Creeks. No impact to scenic vistas would occur as a result of this Program Component.

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Construction: The proposed Program would include construction of pump stations at BBARWA's WWTP site and downstream of the Sand Canyon Recharge Area, monitoring wells near the Solar Evaporation Ponds at BBARWA's WWTP site, and a pipe outlet and erosion control at the Sand Canyon Recharge Area pipe outlet and erosion control. The construction of the proposed facilities would require temporary ground-disturbance within the project sites. The presence of construction equipment and related construction materials would be visible from public vantage points such as open space areas public ROWs such as roadways and sidewalks. Construction of the proposed facilities could be visible from areas with sensitive viewers; however, construction impacts related to aesthetics would be temporary and short-term in nature (15 months). As construction would only occur for a short duration, it would not result in a permanent change to the environment beyond that which is discussed below as a result of operation of the proposed facilities. Furthermore, construction activities are routine within urban and suburban areas, and therefore do not typically constitute a significant aesthetic or scenic vista impact. Thus, construction activities associated with implementation of the proposed Program would result in a less than significant impact to scenic vistas in the area.

Operation: Once constructed, the proposed monitoring wells would each occupy a footprint anticipated to approximately less than one half acre. It is possible that the monitoring wells would be enclosed in a small structure, which is designed to minimize noise from the pumps, should pumps be required to operate the wells. It is anticipated that the proposed monitoring wells would have small footprints (i.e. with a final footprint of about 10 ft by 10 ft in width) and be low profile (about eight ft in height). The monitoring wells downstream of the Sand Canyon Recharge Area would be installed in an urban/suburban environment surrounded by structures that would be residential or commercial in nature, or would be installed at existing water facility sites. As such, the addition of a low-profile enclosed structure within this area would be anticipated to conform to the surrounding environment. **MMs AES-1** and **AES-2** are necessary to minimize impacts to scenic vistas from the development of the monitoring wells downstream of Sand Canyon, due to the fact that the site-specific locations for these facilities are presently unknown. **MM AES-1** would ensure that the monitoring wells and landscaping therein would comply with local design standards and are integrated with local surroundings. The implementation of **MM AES-2** will ensure that impacts to scenic vistas from the implementation of the monitoring wells by the Program will be avoided or assessed further in future CEQA documentation. Thus, impacts would be reduced to a less than significant level.

It is also anticipated that the pump stations would have small footprints and be low profile, as a pump station would occupy less space and be no taller than a one-story residential home. The pump station at the Resort Storage Pond would be consistent with the existing facilities at the Resort Storage Pond site, and as the area has been developed, an additional facility consistent with the surroundings would not impact the mountain ridge vistas visible in the area surrounding this site. Thus, scenic vista impacts from the pump station at the Resort Storage Pond would be less than significant. Furthermore, the pump stations and monitoring wells that would be installed at the BBARWA WWTP would be visually consistent with that which exists within the WWTP at present (refer to **Figures 3-27 and 3-28**, which depict aerial views of the treatment plant facility). Thus, the pump stations and monitoring wells at the BBARWA WWTP would not have a potential to impact a scenic vista—which in the vicinity of the BBARWA WWTP site include mountain ridges and parts of Baldwin Lake that have not been developed. Impacts would be less than significant.

The Sand Canyon Recharge Area will include the installation of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom (shown on **Exhibit 3-1**). This feature will be installed within Sand Canyon (shown on **Exhibit 3-2**), which is a channel at a lower elevation than the residences located on either side of the channel. The channel itself contains some riparian vegetation and is surrounded by forestry. It does not serve as a scenic vista, nor are there any scenic vistas that are visible from this location that would be impacted by the pipe outlet and erosion control, particularly given that it is located below grade, would be designed to blend in with the natural environment and is surrounded by residential uses on either side. Therefore, implementation of the pipe outlet and erosion control at the Sand Canyon Recharge Area would not permanently alter a scenic vista, and impacts would therefore be less than significant.

Program Category 3: Solar Evaporation Ponds

Construction: The proposed Program would include construction of the Solar Evaporation Ponds. The construction of the proposed facilities would require temporary ground-disturbance within the project sites. The presence of construction equipment and related construction materials would be visible from public vantage points such as open space areas public ROWs such as roadways and sidewalks. Construction of the proposed facilities could be visible from areas with sensitive viewers; however, construction impacts related to aesthetics would be temporary and short-term in nature. As construction would only occur for a short duration, it would not result in a permanent

change to the environment beyond that which is discussed below as a result of operation of the proposed facilities (a maximum of 370 days of construction for Solar Evaporation Ponds). Furthermore, construction activities are routine within urban areas, and therefore do not typically constitute a significant aesthetic or scenic vista impact. Thus, construction activities associated with implementation of the proposed Program would result in a less than significant impact to scenic vistas in the area.

Operation: The Solar Evaporation Ponds that would be installed would also occur within the fence line of BBARWA's treatment plant within the undeveloped area to the north and east of today's active WWTP (refer to **Figure 3-26**). This area has been disturbed previously, but presently contains dirt and sparse vegetation as shown on **Photos 4.2-2 through 4.2-4**. The installation of Solar Evaporation Ponds within this area would alter the existing visual setting, but at present, the area is vacant and does not contain any scenic vistas internally within the site. Thus, the proposed Program would not result in a significant impact to scenic vistas that are internal to the BBARWA WWTP site from installation of the proposed Solar Evaporation Ponds, as none exist internally within the site. Note that an internal scenic vista would be a vista that occurs within a given project site. Furthermore, the Solar Evaporation Ponds, which may be netted to prevent birds from utilizing the ponds, would be installed at ground level and thereby would have no potential to obstruct any scenic vistas that could be viewed in the background when viewing the proposed Solar Evaporation Ponds in the foreground. Ultimately, the installation of the Solar Evaporation Ponds within the BBARWA WWTP would be consistent with that which exists at present within the site and scenic vistas would not be significantly altered as a result of the visual change that would result from installation of the proposed Solar Evaporation Ponds. Furthermore, the Solar Evaporation Ponds would be maintained as described in Chapter 3, Program Description of this DPEIR. Maintenance is expected to occur approximately 2-3 times a year, consisting of removal of the brine, maintenance of liners and grading, removal of vegetation, and vector management. Thus, as the Solar Evaporation Ponds would be located below grade, and as the change in visual setting would not be significant, this Program Component would have no potential to significantly alter a scenic vista. Impacts would be less than significant.

Program Category 4: BBARWA WWTP Upgrades

Construction: The proposed Program would include construction of upgrades to BBARWA's existing WWTP to an AWWP and a solar array. The construction of the proposed facilities would require temporary ground-disturbance within the project sites. The presence of construction equipment and related construction materials would be visible from public vantage points such as open space areas public ROWs such as roadways and sidewalks. Construction of the proposed

facilities could be visible from areas with sensitive viewers; however, construction impacts related to aesthetics would be temporary and short-term in nature (a maximum of 515 days of construction for BBARWA WWTP Upgrades). As construction would only occur for a short duration, it would not result in a permanent change to the environment beyond that which is discussed below as a result of operation of the proposed facilities. Furthermore, construction activities are routine within urban areas, and therefore do not typically constitute a significant aesthetic or scenic vista impact. Thus, construction activities associated with implementation of the proposed Program would result in a less than significant impact to scenic vistas in the area.

Operation: The upgrades to BBARWA's existing WWTP to an AWPf would occur entirely within BBARWA's existing WWTP footprint, and would therefore also be visually consistent with the visual setting that exists at the WWTP at present. Furthermore, the area in which the majority of the solar arrays would be installed would be on existing or new building roofs, east of BBARWA's WWTP plant operations, which is an area that is already highly disturbed by BBARWA's existing operations, and south of the BBARWA administration building. The parcel owned by BBCCSD south of the BBARWA administration building is not zoned nor designated by the County's general plan for open space and furthermore is adjacent to the highly disturbed BBARWA operational site, which does not offer pristine vistas. The question regarding guarantee of private views is one of the few qualitative environmental issues that the California Supreme Court has addressed and furthermore, the San Bernardino Countywide Plan and San Bernardino Development Code do not protect private views. Based on this lack of County policy on private views and the State court decisions regarding private views, BBARWA finds that although an adjacent neighbor claims that their views would be degraded by the development of the Solar Array—which in and of itself does not appear to be true given the disturbed nature of the area due to BBARWA's existing WWTP, administration, and solar array operations—the perception that private views from private residences would constitute a significant impact is not found to be correct as this impact does not rise to a level of a significant unavoidable adverse impact in accordance with CEQA as demonstrated in the preceding analysis. Thus, the upgrades to BBARWA's existing WWTP to an AWPf would not have a potential to impact a scenic vista—which in the vicinity of the BBARWA WWTP site include mountain ridges and parts of Baldwin Lake that have not been developed. Impacts would be less than significant.

Other Physical Changes to the Environment

While the proposed Program would result in the installation of several facilities, it would also result in other physical changes to the environment, including releasing advanced treated water into Big Bear Lake by way of Stanfield Marsh. The increase in water in these two areas would have a potential to enhance the visual setting and thereby enhance scenic vistas of Big Bear Lake and Stanfield Marsh. This would result from Big Bear Lake being higher than without the proposed Program, thereby minimizing the dry habitat that occurs around Big Bear Lake's rim when Big Bear Lake levels are low. **Exhibits 4.2-1 and 4.2-2**, show an aerial view of the potential impacts on the Big Bear Lake area as a result of the Program. Additionally, in Stanfield Marsh, greater provision of water in this area has a potential to support wetland/marsh habitat in a larger area than is supported on average at the present time. Impacts would be less than significant.

A second possible other physical change to the environment includes possible utilization of Program Water in place of the existing water source—groundwater—in support of the Stickleback fish at Shay Pond. Scenic vistas in the area include water courses such as Caribou Creek and Shay Creek, in addition to mountain ridges. The change in water source from potable water to Program Water would not result in any noticeable change at Shay Pond, as no greater volume of water would be sent to Shay Pond in support of the Stickleback. Therefore, no impacts to scenic vistas would occur as a result of this possible modification in water source at Shay Pond.

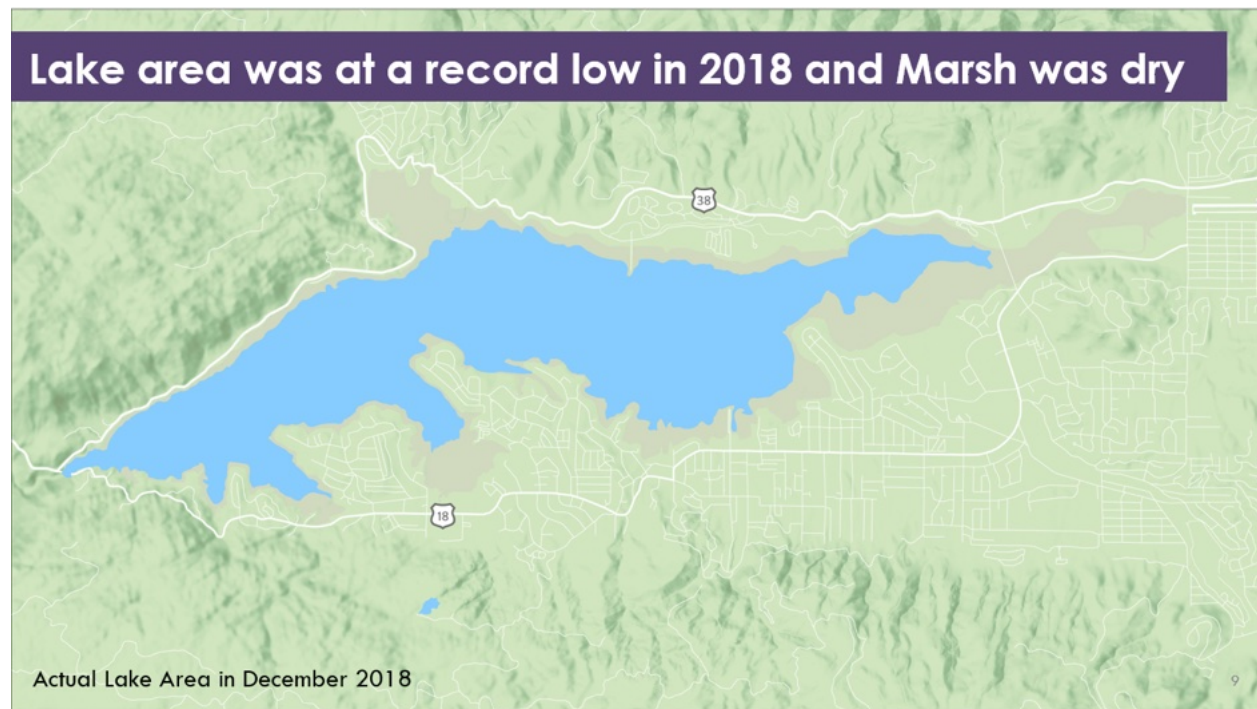

Exhibit 4.2-1: Lake Area at Record Low in 2018

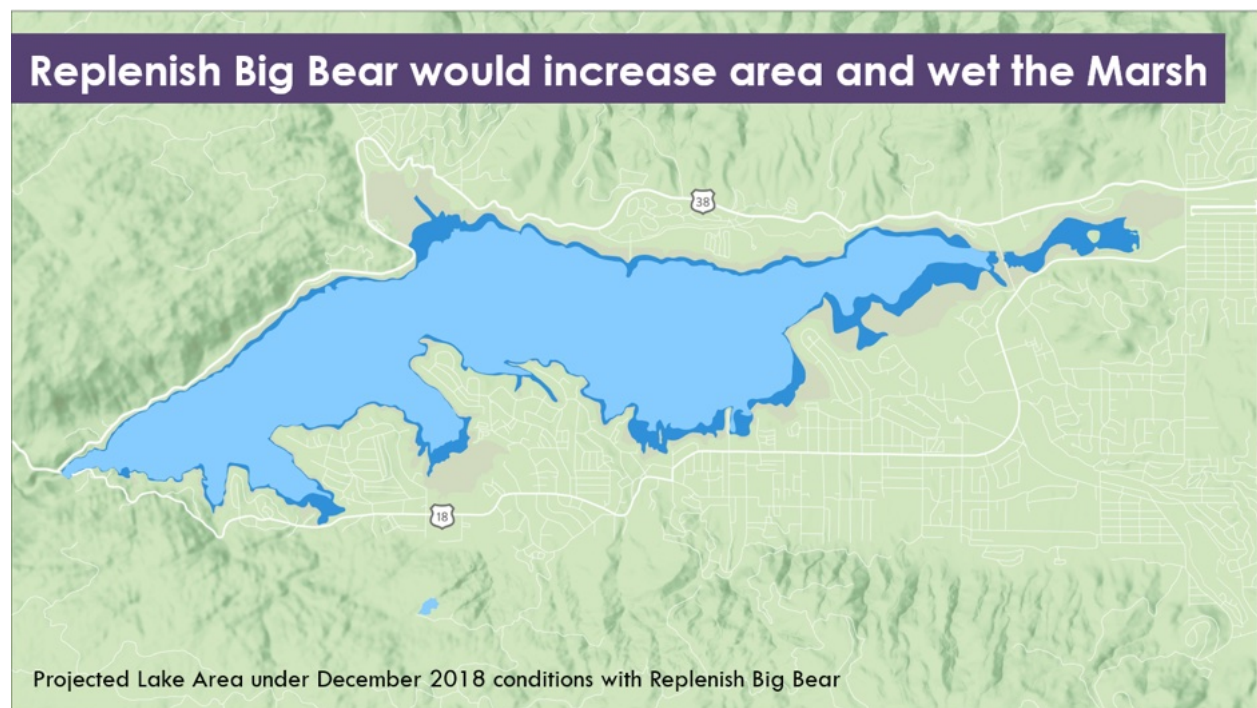

Exhibit 4.2-2: Lake Area with Program Implementation Under Dry Conditions

The Program would also result in up to 2,200 AFY less discharge to the LV Site. Internally, the site does not contain any scenic vistas. The site is used for farming and for discharge (through

the existing discharge basins shown on **Figure 4.2-1**), the reduction in discharge to this site is not anticipated to substantially degrade the visual setting within the LV Site. Under the proposed Program, BBARWA is considering enhancing site maintenance at the LV Site within areas that would become fallow from the reduction or cessation of farming operations at the LV Site. Enhanced site maintenance options are presently being explored by BBARWA, and include, but are not limited to, the following possible options:

- Weed abatement and dust control through use of dust control applications and eco-conscious weed killing applications;
- Planting cover crops, such as sorghum to prevent dust migration; and/or,
- Restoration and stabilization of the site utilizing salt bush and other native shrub species, which are self-sustaining with precipitation over the long term.

BBARWA would continue to own the site and ensure it is maintained, and as there are no scenic vistas internal to the LV Site, impacts to internal scenic vistas as a result of the reduced discharge to the LV Site would be less than significant.

The LV Site is a flat 480-acre site removed by about four miles from the foothills of the San Bernardino Mountains to the south and about 10 miles from the Granite, Fry, and Newberry, Rodman and Ord Mountains, which are located to the north and east. The LV Site would not include any new structures, nor would farming operations be altered in a manner that would obstruct views to the surrounding mountains beyond that which occurs as a result of existing operations. Thus, the reduction in discharge to the LV Site as a result of Program implementation would have no potential to obstruct any scenic vistas that could be viewed in the background when viewing the LV Site in the foreground. Ultimately, scenic vistas would not be significantly altered as a result of the visual change that would result from the reduction in discharge to the LV Site from Program implementation. **Photos 4.2-5** and **4.2-6** depict the vistas to the north and to the south of the LV Site for reference to the existing visual setting. Impacts to surrounding scenic vistas as a result of the reduced discharge to the LV Site would be less than significant.

Photo 4.2-5: LV Site (left) & San Bernardino Mountains (south) along Camp Rock Road
(source: Google Maps)

Photo 4.2-6: LV Site (right) & Granite, Fry, Newberry, Rodman & Ord Mountains (north) along Camp Rock Road (source: Google Maps)

Based on the preceding analysis, it is unlikely that implementation of the Program would result in significant adverse impacts to any scenic vistas. The footprints of the Program Components would be typically unobtrusive, as described above. However, in order to further ensure that impacts to scenic vistas would not be significant, mitigation shall be implemented. **MM AES-1** would ensure that Program facilities and landscaping comply with local design standards and are integrated with local surroundings. The implementation of **MM AES-2** will ensure that impacts to scenic resources from the implementation of future Program facilities and other physical changes to the environment facilitated by the Program will be avoided or assessed further in future CEQA documentation. **MMs AES-1** and **AES-2** are provided below to minimize impacts to scenic vistas from the development of aboveground Program projects to a less than significant level.

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures:

AES-1: *Proposed facilities shall be designed in accordance with local design standards and integrated with local surroundings. Landscaping shall be installed in conformance with local landscaping design guidelines as appropriate to screen views of new facilities and to integrate facilities with surrounding areas.*

AES-2: *Future Replenish Big Bear Program facilities at unknown locations shall either (1) be located outside of scenic viewsheds identified in the General Plan or Municipal Code corresponding to a proposed location for a future facility; (2) be unobtrusive to scenic vistas due to height or blending the facility into the natural environment confirmed by a visual simulation that demonstrates this; or (3) where (1) or (2) are not possible, undergo subsequent CEQA documentation to assess potential aesthetic impacts a future Replenish Big Bear Program facility may have upon contain scenic resources.*

Level of Significance After Mitigation: Less Than Significant

MM AES-1 would ensure that Program facilities and landscaping comply with local design standards and are integrated with local surroundings. The implementation of **MM AES-2** will ensure that impacts to scenic resources from the implementation of future Program facilities and other physical changes to the environment facilitated by the Program will be avoided or assessed further in future CEQA documentation. Thus, impacts would be reduced to a less than significant level.

b) Would the project substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?

There are roadways classified as State scenic highways, in addition to roadways classified as eligible under the State scenic highway program within Big Bear Valley as discussed in **Subsection 4.2.2.1**, Scenic Resources, above; however, there are no officially designated scenic highways within the footprint of the Program. SR-38 is designated as both a State and County Scenic Highway south of State Lane (shown on **Figure 4.2-1**). Big Bear Boulevard is considered Eligible State Scenic Highway, while SR-330 and SR-18 are considered designated County Scenic Routes and Eligible State Scenic Highways. No other State or County Scenic Highways exist in the Program vicinity. Scenic resources are discussed under **Subsection 4.2.2.1**. The most significant visual resources are Big Bear Lake itself, in addition to the mountains and forested areas (part of the SBNF) on ridges surrounding Big Bear Lake and the Big Bear Valley. The activity with the highest potential to conflict with local agency design guidelines is construction-related disturbance of the landscape. Such disturbance can be reduced to an acceptable level by landscaping or revegetating disturbed areas (pipelines, evaporation basins, structural developments, pump stations, and other above ground development) either with landscaping that is consistent with local design guidelines or with native vegetation consistent with that which occurs naturally in the area.

Program Category 1: Conveyance Pipelines

Construction: Conveyance pipeline installation would occur within existing ROW; however, the pipelines could potentially be placed within an eligible scenic highway, or a locally-defined scenic corridor identified in a local General Plan. Pipeline construction activities would progress along the alignment; however, construction would be temporary (about 15 months). Therefore, construction impacts would be less than significant.

All conveyance pipelines would be placed underground and would not be visible once construction is complete. The proposed pipeline alignments are illustrated on the Figures provided as part of Chapter 3, Program Description. The pipeline alignments will occur almost entirely within roadways, though the Sand Canyon Recharge Conveyance Pipeline would traverse through two private properties between Ridgecrest Drive and Sand Canyon Road (**Figure 3-31**). Additionally, the Baldwin Lake Pipeline Alignment Option to Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment, if selected, would traverse through undisturbed ground within Baldwin Lake (**Figure 3-2**), as would the pipeline that traverses through the undeveloped area between Shay Road and the Shay Pond Discharge Project (**Figure 3-33**). The remaining Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options would be installed within road ROW. None of the pipeline alignments or pipeline alignment options would be installed within or proximate to State or County designated scenic highways. Therefore, the construction of conveyance facilities would have no potential to impact scenic resources within a State scenic highway corridor.

The Sand Canyon Recharge Conveyance Pipeline has a potential to require the removal of several trees because the alignment will traverse through the two private properties as shown on **Figure 3-31**. Thus, the proposed Program will impact scenic resources including trees as part of the proposed Program. The installation of this section of pipeline that would impact trees would occur within the City of Big Bear Lake. The City's Municipal Code Chapter 17.10, Tree Conservation and Defensible Spaces stipulates development requirements for projects that would remove existing trees of 12" in diameter at breast height. Though the general location for the Sand Canyon Recharge Conveyance Pipeline has been established, the precise location for this short pipeline alignment is presently unknown. Thus, it is unknown precisely how many trees and what size trees will be removed as part of the installation of this Program Component. Thus, the proposed Program will be required to comply with the City of Big Bear Lake Municipal Code for this and any other Program Component that will impact trees of 12" in diameter at breast height; mitigation is provided below to ensure compliance with this requirement.

While none of the pipeline alignments or pipeline alignment options would be installed within or proximate to State or County designated scenic highways, the Program is anticipated to result in the removal of trees, the precise alignments for pipelines and other facilities have not been fine tuned. Thus, in the event that the proposed Program would result in tree removal outside of the City of Big Bear Lake, in areas under the San Bernardino County jurisdiction, the Program must comply with the San Bernardino County Development Code¹⁶ Plant Protection and Management (88.01) in order to avoid a potentially significant impact from tree removal. The San Bernardino Development Code requires a Tree Removal Permit in conjunction with the land use application or development permit. Where such applications or approvals are required, a Tree Removal Permit pursuant to the County's Development Code would be required. The Development Code stipulates the following for the Mountain Region that would be applicable to the activities proposed under the proposed Program: 88.01.050(f)(1[a]), *The location of the regulated tree or plant and/or its dripline interferes with an allowed structure, sewage disposal area, paved area, or other approved improvement or ground disturbing activity and there is no other alternative feasible location for the improvement.* As such, in order to ensure compliance with San Bernardino County's Development Code, mitigation (**MM AES-3**) shall be required to minimize impacts to trees. **MM AES-3** would ensure that, in the event that trees must be removed, the tree removal is carried out in compliance with the applicable local jurisdiction's municipal code or development code, which would minimize impacts to trees to a level of less than significant.

In addition to the required compliance with San Bernardino County and City of Big Bear Lake regulations pertaining to tree removal, tree removal is also regulated by CAL FIRE. CAL FIRE designates sites containing trees/timberland resources as being "timberland use." CAL FIRE stipulates that when a project will convert timberland to a use other than growing timber a TCP is required [California Public Resources Code 4621(a)]. Also, when projects are converting timberland to another use, the operations are considered commercial timber operations even if the logs are not being sold [California Public Resources Code 4527(a)(1) and (2)]. As such, in addition to the TCP, a THP is required for the removal of the timber [California Public Resources Code 4581]. However, CAL FIRE offers a number of exemptions that could apply to the proposed Program, removing the TCP and THP as requirements to implement the proposed Program. These exemptions are the "Public Agency, Public and Private Utility Right of Way Exemption"¹⁷

¹⁶ San Bernardino County, 2023. Development Code. <https://lus.sbcounty.gov/planning-home/development-code/> (09/21/23)

¹⁷ State of California Department of Forestry and Fire Protection: Notice of timber operations that are exempt from conversion and timber harvesting plan requirements rm-73 (1104.1(b)(c): https://www.fire.ca.gov/media/o1mpuoji/caltrees-utility-row-exemption-form_rev112020.pdf (accessed 09/21/23)

and the “Less Than 3 Acre Conversion Exemption.”¹⁸ Without compliance with the above regulations, the proposed Program could result in a potentially significant impact from tree removal. Thus, in order to avoid a potentially significant impact, the proposed Program must comply with and submit an application for one of the above exemptions to remove clusters of trees subject to CAL FIRE regulations, which shall be enforced through mitigation (**MM AGF-1**) described below. If an exemption is not available, the project will be required to comply with the above State regulations, and therefore prepare a full THP to obtain a TCP.

Based on the discussions above, the removal of trees as a result of Program implementation would have a less than significant impact to result in damage to scenic resources through compliance with CAL FIRE, San Bernardino County, and City of Big Bear Lake regulations, as enforced through **MMs AES-3** and **AGF-1**, below.

Operation: None of the pipeline alignments or pipeline alignment options would be installed within or proximate to State or County designated scenic highways. Therefore, the operation of conveyance facilities would have no potential to impact scenic resources within a State scenic highway corridor. Furthermore, as the pipelines would be located belowground, once installed, the above ground scenic resources would not be impacted by pipeline operation. As described above, the Program pipeline alignments would generally traverse through existing road ROW, through an easement through the two private properties, and possibly through undeveloped portions of Baldwin Lake and the undeveloped area between Shay Road and the Shay Pond Discharge Project (**Figure 3-33**). The undeveloped areas that would be impacted by the construction and operation of the Program pipeline alignments, based on a survey of these areas, do not contain any other scenic resources, such as rock outcroppings or historic buildings. Furthermore, the installation of pipeline within roadways would not impact adjacent structures. Thus, no potential to impact such resources as a result of this Program Component exists during either operation or construction. Therefore, as stated above, with the implementation of mitigation identified below, impacts to scenic resources would be less than significant.

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Construction: It is anticipated that the majority of the proposed ancillary facilities and monitoring wells would individually have small footprints. For instance, the proposed pump stations would occur either within the existing BBARWA WWTP or within the Resort Storage Pond site shown on **Figure 3-30**. As water facilities of similar size and scope exist within the properties at which the pump stations would be installed, there are no trees, rock outcroppings, or historic structures that exist that would be impacted by construction of the proposed ancillary facilities, the proposed Program would have no potential to impact trees, historic structures, or rock outcroppings at these sites. Furthermore, as discussed under Program Category 1, the proposed Program would not install any facilities within or adjacent to a designated State or County Scenic Highway. Therefore, construction of the facilities proposed under Program Category 2 or under any other Program Category, would not impact scenic resources within a State or County Scenic Highway or viewshed thereof. Impacts are less than significant.

Given that the locations of 2 of the monitoring wells needed for the Sand Canyon are presently unknown, it is possible that the development of the monitoring wells may impact other scenic resources such as historic buildings, rock outcroppings, or trees, and therefore a significant and

¹⁸ State of California Department of Forestry and Fire Protection: Notice of timber operations that are exempt from conversion and timber harvesting plan requirements rm-73 (1104.1(a): <https://www.fire.ca.gov/media/30xkpwu/caltrees-less-than-3-acre-conversion-exemption-form.pdf> (accessed 09/21/23)

unavoidable scenic resources impact may occur. As such, mitigation (**MM AES-4**) is provided to ensure that: (1) should the removal of trees be required for a specific project, the implementing agency shall comply with the local jurisdiction's tree ordinance, (2) where clusters of trees subject to CAL FIRE regulations are required to be removed for a specific project, the implementing agency shall comply with and submit an application for the applicable exemption to remove clusters of trees, which shall be enforced through mitigation described below, and (3) the specific location selected for ancillary facilities shall avoid rock outcroppings and other scenic resources or shall require a subsequent CEQA determination. With the implementation of mitigation identified below, impacts to scenic resources would be less than significant.

Operation: Water facilities of similar size and scope exist within the properties at which the pump stations would be installed, there are no trees, rock outcroppings, or historic structures that exist that would be impacted by operation of the proposed ancillary facilities, the proposed Program would have no potential to impact trees, historic structures, or rock outcroppings at these sites. Furthermore, as discussed under Program Category 1, the proposed Program would not install any facilities within or adjacent to a designated State or County Scenic Highway. Therefore, none of the facilities proposed under Program Category 2 or under any other Program Category, would impact scenic resources within a State or County Scenic Highway or viewshed thereof. Operation of the ancillary facilities would have no potential to impact scenic resources beyond that which was described under the construction scenario above, and therefore operational impacts to scenic resources would be less than significant.

Program Category 3: Solar Evaporation Ponds

Construction: The proposed Solar Evaporation Ponds would be installed within the existing BBARWA WWTP site, in an undeveloped area. As discussed under issue (a), above, this area has been disturbed previously, but presently contains dirt and sparse vegetation as shown on **Photos 4.2-2 through 4.2-4**. Given that this Program Component would occur within an area that would be confined to the existing boundaries of the BBARWA WWTP property boundaries, no scenic resources are anticipated to be impacted therein, as none occur within the site that would be impacted by the implementation of this Program Component. As shown in **Photos 4.2-2 through 4.2-4**, the installation of Solar Evaporation Ponds within this area would alter the existing visual setting temporarily during construction, and once installed and operational as seen from the County Designated Scenic Highway (SR-18) to the north of the area proposed for the Solar Evaporation Ponds installation, but given that the area is vacant and does not contain any scenic resources internally within the site, construction of the proposed Solar Evaporation Ponds would not significantly alter the scenic viewshed from SR-18. Furthermore, as previously stated, the Solar Evaporation Ponds would be maintained as described in the Program Description, which would ensure that the viewshed from SR-18, a County Designated Scenic Route, is not degraded as a result of the proposed Program. Impacts would, therefore, be less than significant.

Operation: This Program Component would occur within an area that would be confined to the existing boundaries of the BBARWA WWTP property boundaries, and as such, there are no scenic resources that are anticipated to be impacted therein, as none occur within the site that would be impacted by the implementation of this Program Component. As shown in **Photos 4.2-2 through 4.2-4**, the Solar Evaporation Ponds would alter the existing visual setting once installed and operational as seen from the County Designated Scenic Highway (SR-18) to the north of the area proposed for the Solar Evaporation Ponds, but given that the area is vacant and does not contain any scenic resources internally within the site, construction of the proposed Solar Evaporation Ponds would not significantly alter the scenic viewshed from SR-18. Furthermore, as previously stated, the Solar Evaporation Ponds would be maintained as described in the Program Description, which would ensure that the viewshed from SR-18, a County Designated Scenic

Route, is not degraded as a result of the operation of the Solar Evaporation Ponds. Operational impacts would, therefore, be less than significant.

Program Category 4: BBARWA WWTP Upgrades

Construction: The proposed BBARWA WWTP Upgrades would be installed within the existing BBARWA WWTP site, within already disturbed areas containing the existing BBARWA WWTP facilities. Given that this Program Component would occur within an area that would be confined to the existing boundaries of the BBARWA WWTP property boundaries, no scenic resources are anticipated to be impacted therein, as none occur within the site that would be impacted by the implementation of this Program Component. The installation of BBARWA WWTP Upgrades within this area would conform to the existing visual setting that could potentially be seen as seen from the County Designated Scenic Highway (SR-18) to the north of the area proposed for the BBARWA WWTP Upgrades installation, because this area is presently developed with WWTP facilities that are of a similar scope, size, and height to that which presently occurs within the site, and the BBARWA WWTP site does not contain any scenic resources internally within the site, installation of the proposed BBARWA WWTP Upgrades would not significantly alter the scenic viewshed from SR-18. As water facilities of similar size and scope exist within the BBARWA WWTP site, there are no trees, rock outcroppings, or historic structures that exist that would be impacted by construction of the proposed BBARWA WWTP Upgrades, the proposed Program would have no potential to impact trees, historic structures, or rock outcroppings at these sites. Therefore, construction of the facilities proposed under Program Category 4 or under any other Program Category, would not impact scenic resources within a State or County Scenic Highway or viewshed thereof. Impacts are less than significant.

Operation: The proposed upgrades to the BBARWA WWTP would occur within an existing developed facility that contains no scenic resources as a result of the development that occurs within the site. Development at this site is not anticipated to result in impacts to any scenic resources as no significant scenic resources are contained therein. Water facilities of similar size and scope exist within the BBARWA WWTP Site, as there are no trees, rock outcroppings, or historic structures that exist that would be impacted by operation of the proposed ancillary facilities, the proposed Program would have no potential to impact trees, historic structures, or rock outcroppings at these sites. Furthermore, the installation of BBARWA WWTP Upgrades within this area would conform to the existing visual setting that could potentially be seen as seen from the County Designated Scenic Highway (SR-18) to the north of the area proposed for the BBARWA WWTP Upgrades installation, because this area is presently developed with WWTP facilities that are of a similar scope, size, and height to that which presently occurs within the site, and the BBARWA WWTP site does not contain any scenic resources internally within the site, installation of the proposed BBARWA WWTP Upgrades would not significantly alter the scenic viewshed from SR-18. Operation of the BBARWA WWTP Upgrades would have no potential to impact scenic resources beyond that which was described under the construction scenario above, and therefore impacts to scenic resources from implementation of upgrades and improvements to existing facilities would be less than significant.

Other Physical Changes to the Environment

As previously stated, the proposed Program would also result in other physical changes to the environment, including releasing Program Water into Big Bear Lake by way of Stanfield Marsh. The increase in water in these two areas would have a potential to enhance the visual setting of the lake, and thereby would not result in damage to scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway would not be anticipated to occur as a result of Program implementation. Thus, no impacts are anticipated.

A second possible other physical change to the environment includes possible utilization of Program Water in place of the existing water source—groundwater—in support of the Stickleback fish at Shay Pond. The change in water source would not result in any noticeable change at Shay Pond, as no greater volume of water would be sent to Shay Pond in support of the Stickleback, and thereby would not result in damage to scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway would not be anticipated to occur as a result of Program implementation. Thus, no impacts are anticipated.

The Program would also result in up to 2,200 AFY less discharge to the LV Site. The LV Site is not located within a County or State Scenic Highway, does not contain any rock outcroppings, does not contain any historic buildings, and does not contain any trees that would be altered as a result of the proposed Program. Thus, the reduction in discharge to the LV Site as a result of the proposed Program would not damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway would not be anticipated to occur as a result of Program implementation. No impacts beyond those previously discussed under this issue as a result of other physical changes to the environment are anticipated to occur.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

Mitigation Measures:

- AES-3:** *Should the removal of trees be required for a specific Program Component, the implementing agency shall comply with the applicable local jurisdiction's municipal code or development code pertaining to the removal of trees. For Program Components within the City of Big Bear Lake, the implementing agency shall comply with the City's Municipal Code Chapter 17.10, Tree Conservation and Defensible Spaces, where applicable. For Program Components within San Bernardino County, the implementing agency shall comply with the San Bernardino County Development Code Plant Protection and Management (88.01), where applicable.*
- AES-4:** *Future proposed facilities defined within the Replenish Big Bear Program at unknown locations shall either (1) be located within sites that avoid rock outcroppings and other scenic resources as defined in State CEQA Guidelines Appendix G, or (2) undergo subsequent CEQA documentation to assess potential impacts from locating a future facility in an area that may contain scenic resources.*
- AGF-1:** *Should the removal of clusters of trees subject to CAL FIRE timberland conversation regulations be required for a specific Program Component, the implementing agency shall comply with CAL FIRE regulations, specifically, prior to the removal of any trees subject to CAL FIRE regulations for a given Program Component, the implementing agency shall obtain an exemption, a "Public Agency, Public and Private Utility Right of Way Exemption" (1104.1(b)(c)) or a "Less Than 3 Acre Conversion Exemption" (1104.1(a)). Should an exemption for the removal of trees subject to CAL FIRE timberland conversation regulations be unavailable due to the limitations set forth by CAL FIRE of one exemption per agency per five years, the implementing agency shall prepare and submit a Timberland Conversion Permit (TCP) pursuant to California Public Resources Code 4621(a) and a Timber Harvesting Plan (THP) pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.*

Level of Significance After Mitigation: Less Than Significant.

The implementation of **MM AES-3** and **AGF-1** would ensure that the proposed facilities' impacts to scenic resources, such as trees, are minimized to a level of less than significant. Furthermore, **MM AES-4** would ensure that future facilities are either not located within sites containing scenic resources or undergo subsequent CEQA documentation to fully analyze the impacts thereof.

c) Would the project, in non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning or other regulations governing scenic quality.

Based on a review of the California Office of Planning and Research's (OPR) Site Check,¹⁹ the majority of the Program Area is considered urbanized under California Public Resources Code 21071 and California Public Resources Code 21094.5 or as an urbanized area or urban cluster under the Census (**Figure 4.2-4**). However, the BBARWA WWTP area, a small portion of the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment, and the entirety of the Shay Pond Discharge Project are located in rural areas. As such, following analysis addresses the Program Components based on their location in relation to urbanized or non-urbanized area boundaries delineated on **Figure 4.2-4**.

Program Category 1: Conveyance Pipelines

Construction: Construction activities associated with conveyance pipelines (new Shay Pond Conveyance Pipeline, Shay Pond Replacement Pipeline, Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, Sand Canyon Recharge Conveyance Pipeline) would result in short-term impacts (about 15 months of construction) to visual resources. Construction activities would require the use of construction equipment and storage of materials along the conveyance pipeline alignments. Excavated areas, stockpiled soils and other materials generated during construction would present negative visual elements to the existing landscape. However, these effects would be nominal because the pipelines would be located within existing road ROW, compacted dirt throughways, as described under issue b, above, in locations with sufficient area to temporarily store construction equipment and materials, and the effects would be temporary for only the nominal duration of construction, and therefore not substantially affect the existing visual character of the surrounding area. Furthermore, there are no regulations governing scenic quality within the San Bernardino County Development Code or City of Big Bear Lake Zoning Code that would apply to the development of the proposed conveyance facilities, particularly in light of California Government Code Section 53091, which renders infrastructure projects such as that which is proposed under the Program land use and zoning independent. Construction impacts would be less than significant.

Operation: Conveyance pipelines (new Shay Pond Conveyance Pipeline, Shay Pond Replacement Pipeline, Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, Sand Canyon Recharge Conveyance Pipeline) would be placed underground and would not be visible once construction is complete. As these facilities will all be located below ground, and the roadways and undisturbed ground surfaces within which the proposed pipeline alignments will be installed will be returned to their original or better condition once installed below ground, the proposed Program will have no potential to conflict with applicable zoning or other regulations governing scenic quality, or otherwise substantially degrade the existing visual character or quality of public views of the site and its surroundings. Impacts would be less than significant.

¹⁹California Office of Planning and Research, 2023. Site Check. <https://sitecheck.opr.ca.gov/> (accessed 09/21/23)

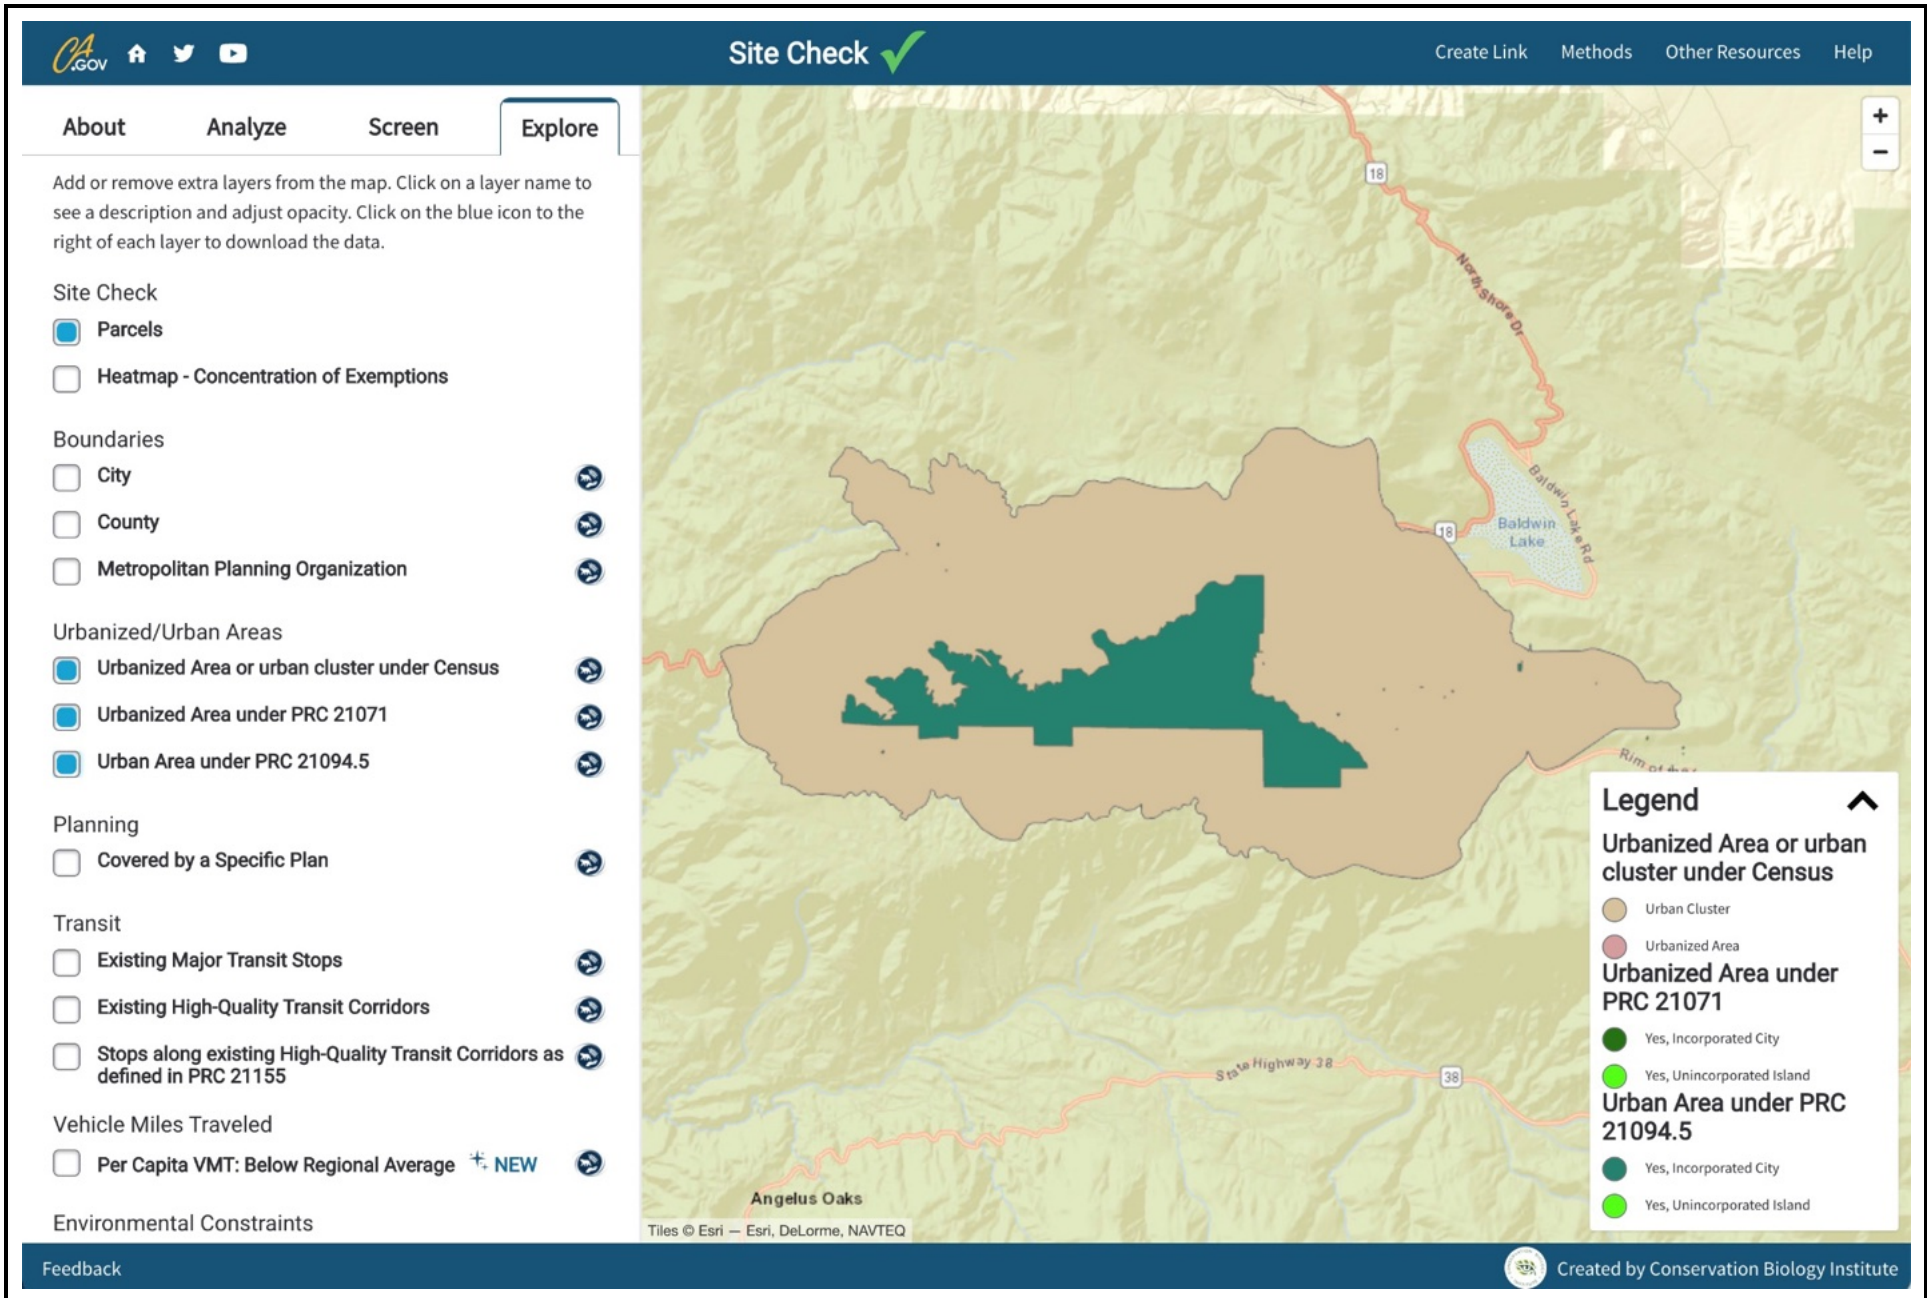

FIGURE 4.2-4

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Construction: Similar to that which is described under Program Category 1, above, construction activities associated with ancillary facilities would result in short-term (15 months) impacts to visual resources. Construction activities would require the use of construction equipment and storage of materials at the ancillary facility project sites. Excavated areas, stockpiled soils and other materials generated during construction would present negative visual elements to the existing landscape. However, these effects would be nominal because the ancillary facilities would be installed in developed areas with sufficient area to temporarily store construction equipment and materials, and the effects would be temporary for only the nominal duration of construction, and therefore not substantially affect the existing visual character of the surrounding area. Furthermore, there are no regulations governing scenic quality within the San Bernardino County Development Code or City of Big Bear Lake Zoning Code that would apply to the development of the proposed ancillary facilities, particularly in light of California Government Code Section 53091, which renders infrastructure projects such as that which is proposed under the Program land use and zoning independent. Impacts would be less than significant.

Operation: Once constructed, the proposed monitoring wells would occupy a footprint anticipated to be less than 20 feet by 20 feet, within a site that is less than one half acre; therefore, it is anticipated that the proposed monitoring wells would individually have small footprints and be low profile. While the precise location for two of the future monitoring wells is presently unknown, the monitoring wells will be generally downstream of the Sand Canyon Recharge Area. As stated above, there are no regulations governing scenic quality within the San Bernardino County Development Code or City of Big Bear Lake Zoning Code that would apply to the development of the proposed ancillary facilities, particularly in light of California Government Code Section 53091. As compliance with the zoning is not required for water facilities, in order to ensure that the Sand Canyon Monitoring Wells conform with design requirements established in the local jurisdiction planning documents, mitigation (**MM AES-5**) is necessary to avoid a potentially significant impact under this issue. The implementation of **MM AES-5** requires future facilities to conform with design requirements established by local jurisdictions, thereby preventing a conflict with the regulations governing scenic quality. Impacts would be less than significant with mitigation.

The remaining two wells would be installed within the BBARWA WWTP property boundary near the Solar Evaporation Ponds, and two pump stations would be installed within the BBARWA WWTP facility as well, which is considered a rural area. Given that these wells and pump stations would be installed within a facility containing similar water infrastructure development, and the monitoring wells and pump stations that would be installed within the BBARWA WWTP are anticipated to conform to the existing visual setting and thereby would have a less than significant potential to substantially degrade the existing visual character or quality of public views of the site and its surroundings. Thus, impacts would be less than significant.

It is anticipated that the pump stations would, similar to the monitoring wells, individually have small footprints. The pump station at the Resort Storage Pond would be located within the City of Big Bear Lake, which is considered an urbanized area. As compliance with the zoning is not required for water facilities, in order to ensure that the Sand Canyon Booster Station conforms with design requirements established in the local jurisdiction planning documents, mitigation (**MM AES-5**) is necessary to avoid a potentially significant impact under this issue because it requires future facilities to conform with design requirements established by local jurisdictions, thereby preventing a conflict with the regulations governing scenic quality. Thus, impacts would be less than significant with mitigation.

Program Category 3: Solar Evaporation Ponds

Construction: Similar to that which is described under Program Category 1 and 2, above, construction activities associated with evaporation would result in short-term (about 15 months) impacts to the area within which the Solar Evaporation Ponds would be installed: the BBARWA WWTP site. Construction activities would require the use of construction equipment and storage of materials at the BBARWA WWTP site. Excavated areas, stockpiled soils and other materials generated during construction would present new visual elements to the existing landscape, but the Solar Evaporation Ponds would be installed within an already disturbed environment containing no quality public views internally or externally (refer to issue a, above). Thus, these effects would be nominal because the Solar Evaporation Ponds would be installed in locations with sufficient area to temporarily store construction equipment and materials, and the effects would be temporary for only the nominal duration of construction, and therefore not substantially affect the existing visual character of the surrounding area. Impacts would be less than significant.

Operation: The proposed Solar Evaporation Ponds would be installed within the BBARWA WWTP property boundary, which is considered to be a non-urbanized area. As discussed under issue (a), above, this area has been disturbed previously, but presently contains exposed soil/dirt and sparse vegetation as shown on **Photos 4.2-2 through 4.2-4**. Given that this Program Component would occur within an area that would be confined to the existing boundaries of the BBARWA WWTP property boundaries, the Solar Evaporation Ponds are anticipated to conform to the existing visual setting and thereby would have a less than significant potential to substantially degrade the existing visual character or quality of public views of the site and its surroundings. Impacts would be less than significant.

Program Category 4: BBARWA WWTP Upgrades

Construction: The upgrades proposed at the BBARWA WWTP would occur within existing areas of development or areas that have been previously compacted or disturbed within the BBARWA WWTP site as shown on **Figure 3-23 through 3-25**. The solar panels, shown on **Figure 3-37** would be installed throughout the BBARWA WWTP site and the adjacent (to the south) BBCCSD site. Note that the BBARWA WWTP already contains solar panels both within and adjacent to its WWTP site. Furthermore, many of the BBARWA WWTP Upgrades would be installed within enclosed spaces that would shield the proposed treatment facilities from public view.

Construction within the BBARWA WWTP would be temporary (24 months) in nature, and therefore any changes in public views of the already disturbed site would be temporary, with the overall character of the BBARWA WWTP site upon the conclusion of construction remaining comparable to that which exists at the site at present. Impacts would be less than significant.

Operation: Thus, as the proposed upgrades to the BBARWA WWTP, including the solar array that would be installed as part of this project, as discussed under issue (a), above, would occur within an existing developed facility, development therein would be consistent with the existing visual setting. Further development within this existing treatment facility would have no potential to substantially degrade the existing visual character or quality of public views of the site and its surroundings because the visual character of the site at present is that of a wastewater treatment facility containing infrastructure necessary to operate the wastewater treatment facility and under the proposed Program, the overall setting of the site would remain a wastewater treatment facility containing similar and consistent wastewater infrastructure. Impacts would be less than significant.

Other Physical Changes to the Environment

As previously stated, the proposed Program would also result in other physical changes to the environment, including releasing Program Water into Big Bear Lake by way of Stanfield Marsh. The increase in water in these two areas would occur within a defined urban area per **Figure 4.2-4**, and given that the release of water into Big Bear Lake by way of Stanfield Marsh in and of itself does not include any physical components beyond those discussed under Program Categories 1-4, above, no potential to conflict with applicable zoning or other regulations governing scenic quality exists. Thus, no impacts are anticipated.

A second possible other physical change to the environment includes possible utilization of Program Water in place of the existing water source—groundwater—in support of the Stickleback fish at Shay Pond. The change in water source would not result in any noticeable change at Shay Pond, as no greater volume of water would be sent to Shay Pond in support of the Stickleback, and thereby would not result substantially degrade the existing visual character or quality of public views of the site and its surroundings. Thus, no impacts are anticipated.

The Program would also result in up to 2,200 AFY less discharge to the LV Site. The LV Site is located in a non-urbanized area. Due to the use of the site for farming and for discharge (through the existing discharge basins shown on **Figure 4.2-1**), the reduction in discharge to this site is not anticipated to degrade the visual character of the site. In fact, as stated under issue (a), above, the use of the site for farming would be reduced from about 190 acres of farmland to a utilization of about 40 acres. If the continuation of farming at the LV Site is infeasible due to lack of sufficient water, lack of sufficient demand for the crop, or is infeasible due to cost of continuing the farming operation by the farmer, BBARWA would either use the LV Site unlined discharge basins (**Figure 3-35**) to handle the 340 AFY of secondarily treated effluent or could make the treated effluent available to another party for an alternative use. Under the proposed Program, BBARWA is considering enhancing site maintenance at the LV Site within areas that would become fallow from the reduction or cessation of farming operations at the LV Site. Enhanced site maintenance options are presently being explored by BBARWA, as described under issue (a), above. Regardless, given that the LV Site would not undergo substantial change under the proposed Program because BBARWA would continue to own the site and ensure it is maintained, the proposed Program would have a less than significant potential to degrade the existing visual character or quality of public views of the LV Site and its surroundings.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

Mitigation Measures:

AES-5: *When Replenish Big Bear Program above ground facilities are constructed in the future, the local agency design guidelines for the project site shall be followed to the extent that they do not conflict with the engineering and budget constraints established for the facility and except where such compliance is not required by California law.*

Level of Significance After Mitigation: Less Than Significant

The implementation of **MM AES-5** would ensure that future facilities will conform with design requirements established by local jurisdictions.

- d) **Would the project create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?**

Program Category 1: Conveyance Pipelines

Construction: Construction of the proposed conveyance facilities (new Shay Pond Conveyance Pipeline, Shay Pond Replacement Pipeline, Lake Discharge Pipeline Alignment Options, Sand Canyon Recharge Conveyance Pipeline) is not anticipated to require nighttime lighting. However, if nighttime construction is required for any of the conveyance pipeline alignments, nighttime lighting at construction sites would contribute to ambient light and could adversely affect views in the area at night, which could result in a significant light and/or glare impact. Thus, mitigation (**MM AES-6**) is required to ensure that no lighting intrudes into sensitive areas and to ensure directing light and shielding is used to minimize off-site illumination. Impacts would be less than significant with mitigation.

Operation: The proposed conveyance systems would not require operational nighttime lighting because they would be installed belowground. As a result, there would be no new sources of lighting as a result of conveyance facilities. No impacts related to light and glare from facilities proposed under this Program Category would occur.

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Construction: Construction of the proposed ancillary facilities is not anticipated to require nighttime lighting. However, if nighttime construction is required, nighttime lighting at construction sites would contribute to ambient light and could adversely affect views in the area at night. Thus, mitigation (**MM AES-6**) is required to ensure that no lighting intrudes into sensitive areas and to ensure directing light and shielding is used to minimize off-site illumination. Impacts would be less than significant with mitigation.

Operation: Once constructed, the proposed monitoring wells would occupy a footprint anticipated to be less than 20 feet by 20 feet, within a site that would be less than one half acre in size; therefore, it is anticipated that the majority of the proposed wells would individually have small footprints and be low profile. Though the precise location for future monitoring wells downstream of Sand Canyon is presently unknown, the facilities under this Program Category will be required to comply with the local jurisdiction zoning codes and any other regulations governing scenic quality. However, **MM AES-6** would ensure compliance with the applicable zoning code lighting and glare standards. **MM AES-7** is required to ensure a facility lighting plan for each individual facility that applies to both construction and operation is prepared that verifies that the lighting doesn't exceed 1.0 lumen at the nearest sensitive received, thereby preventing a significant light and glare impact. Impacts would be less than significant with mitigation.

The proposed monitoring wells and pump stations located within the BBARWA WWTP would occur within an existing developed facility already containing similar water infrastructure development that contains lighting. Implementation of the proposed improvements could result in new exterior nighttime lighting for operational and security purposes within the existing treatment facilities, and therefore result in a significant light and/or glare impact. The increase in lighting within existing treatment facilities could result in spill over lighting onto adjacent uses. Therefore, mitigation (**MMs AES-6** and **AES-7**) that would prevent significant spill over lighting onto adjacent uses is required. The applicable zoning codes govern acceptable lighting requirements, and thus, **MM AES-6** would ensure compliance with the applicable zoning code lighting and glare standards. **MM AES-7** is required to ensure a facility lighting plan for each individual facility that applies to both construction and operation is prepared that verifies that the lighting doesn't exceed

1.0 lumen at the nearest sensitive received, thereby preventing a significant light and glare impact. Impacts would be less than significant with mitigation.

The pump station at the Resort Storage Pond site may include nighttime security lighting mounted to the buildings and/or structures. These new sources of lighting could result in significant light intrusion impacts onto adjacent land uses. The proposed ancillary facilities would not include aboveground structures that would include uninterrupted expanses of glass or other highly-reflective construction material. Therefore, **MM AES-6** would ensure compliance with the applicable zoning code lighting and glare standards. **MM AES-7** is required to ensure a facility lighting plan for each individual facility that applies to both construction and operation is prepared that verifies that the lighting doesn't exceed 1.0 lumen at the nearest sensitive received, thereby preventing a significant light and glare impact. Impacts would be less than significant with mitigation.

Program Category 3: Solar Evaporation Ponds

Construction: Construction of the proposed Solar Evaporation Ponds is not anticipated to require nighttime lighting. If nighttime construction is required there are no nearby sensitive receptors at the BBARWA WWTP site that would be impacted by glare or nighttime lighting (the nearest sensitive receptor to the evaporation ponds is greater than 1,000 feet from the project footprint). However, due to its remote location, nighttime lighting at the Solar Evaporation Ponds could result in ambient lighting that may impact the overall nighttime lighting setting in the Baldwin Lake area, which could result in a potentially significant light and/or glare impact. Thus, mitigation (**MM AES-6**) is required to ensure that no lighting intrudes into sensitive areas and to ensure directing light and shielding is used to minimize off-site illumination. Impacts would be less than significant with mitigation. Impacts would be less than significant with mitigation.

Operation: The proposed Solar Evaporation Ponds are not anticipated to require nighttime or security lighting; however, should the installation of any additional lighting be necessary, because these facilities will be located on relatively flat terrain, potential lighting impacts would be less than significant. The potential for glare from proposed the Solar Evaporation Ponds affecting specific residences and/or viewsheds for short periods of time is low and would not introduce substantial new sources of glare, and is therefore, less than significant.

Program Category 4: BBARWA WWTP Upgrades

Construction: Similar to construction of the proposed Solar Evaporation Ponds, construction of the proposed BBARWA WWTP Upgrades is not anticipated to require nighttime lighting. If nighttime construction is required there are no nearby sensitive receptors at the BBARWA WWTP site that would be impacted by glare or nighttime lighting. However, due to its remote location, nighttime lighting at the BBARWA WWTP site could result in ambient lighting that may impact the overall nighttime lighting setting in the Baldwin Lake area, and therefore result in a potentially significant light and/or glare impact. Thus, mitigation (**MM AES-6**) is required to ensure that no lighting intrudes into sensitive areas and to ensure directing light and shielding is used to minimize off-site illumination. Impacts would be less than significant with mitigation.

Operation: The proposed upgrades to the BBARWA WWTP would occur within an existing developed facility already containing water treatment facilities that contain lighting, in addition to solar panels that could cause glare. This facility is also located within a non-urbanized area, but is surrounded by rural development to the south and Baldwin Lake to the north, east, and west of the property boundaries. Thus, no development would be contemplated in future surrounding the BBARWA WWTP property boundary to the east, north, or west. The solar panels would be located adjacent to existing solar panels at BBARWA, which have not resulted in glare impacts to nearby

sensitive receptors or to aircraft fly-overs. The addition of new solar panels is not anticipated to result in glare impacts to aircraft fly-overs or nearby sensitive receptors, particularly given the lack of nearby sensitive receptors, and that the BBARWA WWTP Site is located outside of the Big Bear Airport land use compatibility zone. Further, solar panels typically result in less glare than standard home window glass,²⁰ and are designed to absorb light, rather than reflect it. Thus, glare impacts from the installation of the solar panels are anticipated to be less than significant.

Regardless, implementation of the proposed improvements could result in new exterior nighttime lighting for operational and security purposes within the existing treatment facilities. The increase in lighting within existing treatment facilities could result in spill over lighting onto adjacent uses. Furthermore, glare from the proposed solar panels could adversely affect daytime views of the area, and result in a potentially significant light and/or glare impact. Therefore, mitigation (**MMs AES-6** and **AES-7**) that would minimize glare and lighting impacts at the nearest sensitive receptors would be required to minimize impacts to a level of less than significant.

Other Physical Changes to the Environment

As previously stated, the proposed Program would also result in other physical changes to the environment, including releasing advanced treated water into Big Bear Lake by way of Stanfield Marsh, possible utilization of Program Water in place of the existing water source—groundwater—in support of the Stickleback fish at Shay Pond and reduced discharge to the LV Site. The discharge to Shay Pond and Big Bear Lake would not result in any new sources of lighting, and the provision of additional water in Stanfield Marsh and Big Bear Lake would not be such that new sources of glare or reflection would occur beyond that which can occur at present. The reduction in discharge to the LV Site would not result in any lighting changes or cause any potential for glare that does not already exist under the current operations. These physical changes would not result in any change in lighting at Big Bear Lake, Stanfield Marsh, or at the LV Site. Furthermore, there would be no potential for increased glare as a result of these physical changes. Therefore, no potential to create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area exists. Thus, no impacts would occur.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures:

AES-6: *Future Replenish Big Bear Program projects shall implement at least the following measures, unless they conflict with the local jurisdiction's light requirements, in which case the local jurisdiction's requirements shall be enforced:*

- *Use of low-pressure sodium lights where security needs require such lighting to minimize impacts of glare.*
- *The height of lighting fixtures shall be lowered to the lowest level consistent with the purpose of the lighting to reduce unwanted illumination.*
- *Directing light and shielding shall be used to minimize off-site illumination during both construction or operation of any Program facility.*
- *No light shall be allowed to intrude into sensitive light receptor areas during both construction or operation of any Program facility.*

²⁰ <https://www.nrel.gov/state-local-tribal/blog/posts/research-and-analysis-demonstrate-the-lack-of-impacts-of-glare-from-photovoltaic-modules.html>

- ***Non-reflective materials and/or coatings shall be used on the exterior of all facilities if constructed in a publicly visible location (such as from a roadway or public facility).***

AES-7: ***A Facility lighting plans that shall apply to construction and operation shall be prepared for each Replenish Big Bear Program component and shall demonstrate that glare from construction, operation and safety night lights that may create light and glare affecting adjacent occupied property are sufficiently shielded to prevent light and glare from spilling into occupied structures. This plan shall specifically verify that the lighting doesn't exceed 1.0 lumen at the nearest residence to any lighting site within the project footprint. This plan shall be implemented by the implementing agency to minimize light or glare intrusion onto adjacent properties.***

During Program construction and operation, the Implementing Agency shall eliminate all nonessential lighting throughout each individual Program area and avoid or limit the use of artificial light during the hours of dawn and dusk when many wildlife species are most active. BBARWA shall ensure that lighting for Program activities is shielded, cast downward, and does not spill over onto other properties or upward into the night sky, except where essential to perform Program operations (see the International Dark-Sky Association standards at <http://darksky.org/>). BBARWA shall ensure use of LED lighting with a correlated color temperature of 3,000 Kelvins or less.

Level of Significance After Mitigation: Less Than Significant

The implementation of **MM AES-6** and **AES-7** would ensure that light and glare impacts from future structures associated with the Program are minimized to a level of less than significant.

4.2.6 Cumulative Impacts

Construction of the new facilities could alter existing views and contribute to significant cumulative aesthetic impacts in combination with other projects in the Program Area. The implementation of **MMs AES-1** through **AES-7**, in addition to **MM AGF-1** would ensure that the proposed facilities' contribution to cumulative aesthetic impacts would be reduced to less than cumulatively considerable by: ensuring that facilities and landscaping comply with local design standards and are integrated with local surroundings; ensuring that impacts to scenic resources from the implementation of future Program facilities will be avoided or assessed further in future CEQA documentation; ensuring that the proposed facilities' impacts to scenic resources, such as trees, are minimized to a level of less than significant; ensuring that future facilities are either not located within sites containing scenic resources or undergo subsequent CEQA documentation to fully analyze the impacts thereof ensuring compliance with the applicable zoning code; ensuring that future facilities will conform with design requirements established by local jurisdictions; and, ensuring that light and glare impacts from future structures associated with the Program are minimized. Thus, the proposed Program would not cause cumulatively considerable contributions to cumulative aesthetics impact.

4.2.7 Significant and Unavoidable Impacts

As determined in the preceding evaluation, with the implementation of mitigation, all of the proposed Program's potentially significant aesthetic impacts would be reduced to a level of less than significant and have no potential to result in significant and unavoidable aesthetics impacts in the Big Bear Valley.

4.3 AGRICULTURE AND FORESTRY RESOURCES

4.3.1 Introduction

This subchapter evaluates the environmental impacts to agriculture and forestry resources from implementation of the Replenish Big Bear Program (Program). The following topics address whether the proposed Program would convert farmland that is considered Prime, Unique, or of Statewide Importance; conflict with agricultural use or a California Land Conservation Act of 1965, also known as the Williamson Act, contract; result in rezone or loss of forestry or timberlands; or otherwise convert farmland and timberlands to non-agricultural use or non-forest land, respectively. The purpose of the agriculture and forestry resources component of this DPEIR is to identify and provide analysis and assessment of the potential for agriculture uses and timberlands to exist within the in the Big Bear Valley and Lucerne Valley or the sensitivity for such resources to be encountered at a future specific project site so that they can be incorporated into the planning process for future infrastructure and entitlement compliance considerations.

The analysis herein, while prepared under a Programmatic DEIR, has been provided as the project level for all of the facilities proposed under this Program, with one exception: the monitoring wells at Sand Canyon. Sufficient detail for all other projects proposed under this Program is available for project level impact forecasts.

These issues will be discussed below as set in the following framework:

- Introduction
- Environmental Setting: Agriculture and Forestry Resources
- Regulatory Setting
- Thresholds of Significance
- Potential Impacts
- Cumulative Impacts
- Unavoidable Adverse Impacts

4.3.2 Environmental Setting: Agriculture and Forestry Resources

4.3.2.1 Regional Agriculture

According to the San Bernardino County's *2020 and 2021 San Bernardino County Crop Reports*,^{21,22} San Bernardino County saw harvest of approximately 1,385,216 acres of non-irrigated and irrigated Important Farmlands in 2020, but has continued to see a decline in farmlands adjacent to existing urban areas over the years. Specifically, San Bernardino County experienced significant urban growth since 2010, ranking tenth in the State for urban growth. Approximately 18,643.4 acres have either been converted from agricultural to nonagricultural uses or have been out of use in San Bernardino County between 2010 and 2020. Further, approximately 10,471 acres have been converted from agricultural to nonagricultural uses in San Bernardino County between 2020 and 2021.

According to the *2021 Annual Crop Report for San Bernardino County*, the gross value of agricultural production in San Bernardino County for 2021 totaled approximately \$350 million, which equates to a decrease of about 16.7 percent over 2020 production, primarily due to a

²¹ *2021 Annual Crop Report for San Bernardino County*. <https://awm.sbcounty.gov/wp-content/uploads/sites/84/2022/10/N4454-AWM-CROP-REPORT-2021-Web.pdf> (accessed 03/20/23)

²² *2020 Annual Crop Report for San Bernardino County* <https://awm.sbcounty.gov/wp-content/uploads/sites/84/2022/04/AWM-CROP-REPORT-2020-080521.pdf> (accessed 03/20/23)

decrease in the price for navel oranges, a decrease in vegetable crops due to increased urban development in the west end, and a decrease in animal products due to the closure of 13 egg farms and eight dairies. Despite continued conversion of agricultural land in the county to business and residential development, agriculture is still an integral component of the economy in San Bernardino County.

However, a review of the occurrence of commercial agricultural activity in the San Bernardino Mountains provided in the 2020 San Bernardino Countywide Plan Environmental Impact Report (San Bernardino Countywide Plan EIR) indicates that only 166 acres of important farmland are zoned in the Mountain Region of San Bernardino County, and that all of this acreage occurs in the Oak Glen area. Review of the Countywide Plan EIR indicates that no prime or important farmland occurs within unincorporated territory in the Big Bear Valley. Similarly, a review of the City of Big Bear Lake General Plan Land Use Element concluded that no land is designated for agricultural use within the City of Big Bear Lake. The only land uses that allow “horticulture” and “agriculture” uses in the Big Bear General Plan are Rural Residential uses and the Open Space land use designations (City of Big Bear Lake General Plan Land Use Element, 1999). Regardless, based on a field review of the project locations there are no commercial agricultural or horticultural land uses found within these areas.

In 1980, BBARWA initiated discharge of undisinfected secondary treated wastewater effluent to Lucerne Valley. This was achieved by a pipeline extending from the BBARWA WWTP to a BBARWA’s LV Site. The LV Site referred to herein is the 480-acre portion of the larger 630-acre BBARWA owned site in Lucerne Valley that is regulated by a Colorado Regional Board WDR, which stipulates that 340 acres of the LV Site can be irrigated with recycled water from BBARWA’s WWTP, with an additional 140 acres available for irrigation utilizing other water sources. The BBARWA Treated Water Discharge Pipe alignment is shown on **Figure 4.3-1**. An enlarged aerial photo of the property owned by BBARWA is provided as **Figure 4.2-1**. A portion of the site is now farmed under a contract to the agency and also includes unlined discharge basins where the treated effluent is allowed to percolate into the Lucerne Valley Basin when it is not used for irrigating the project site.

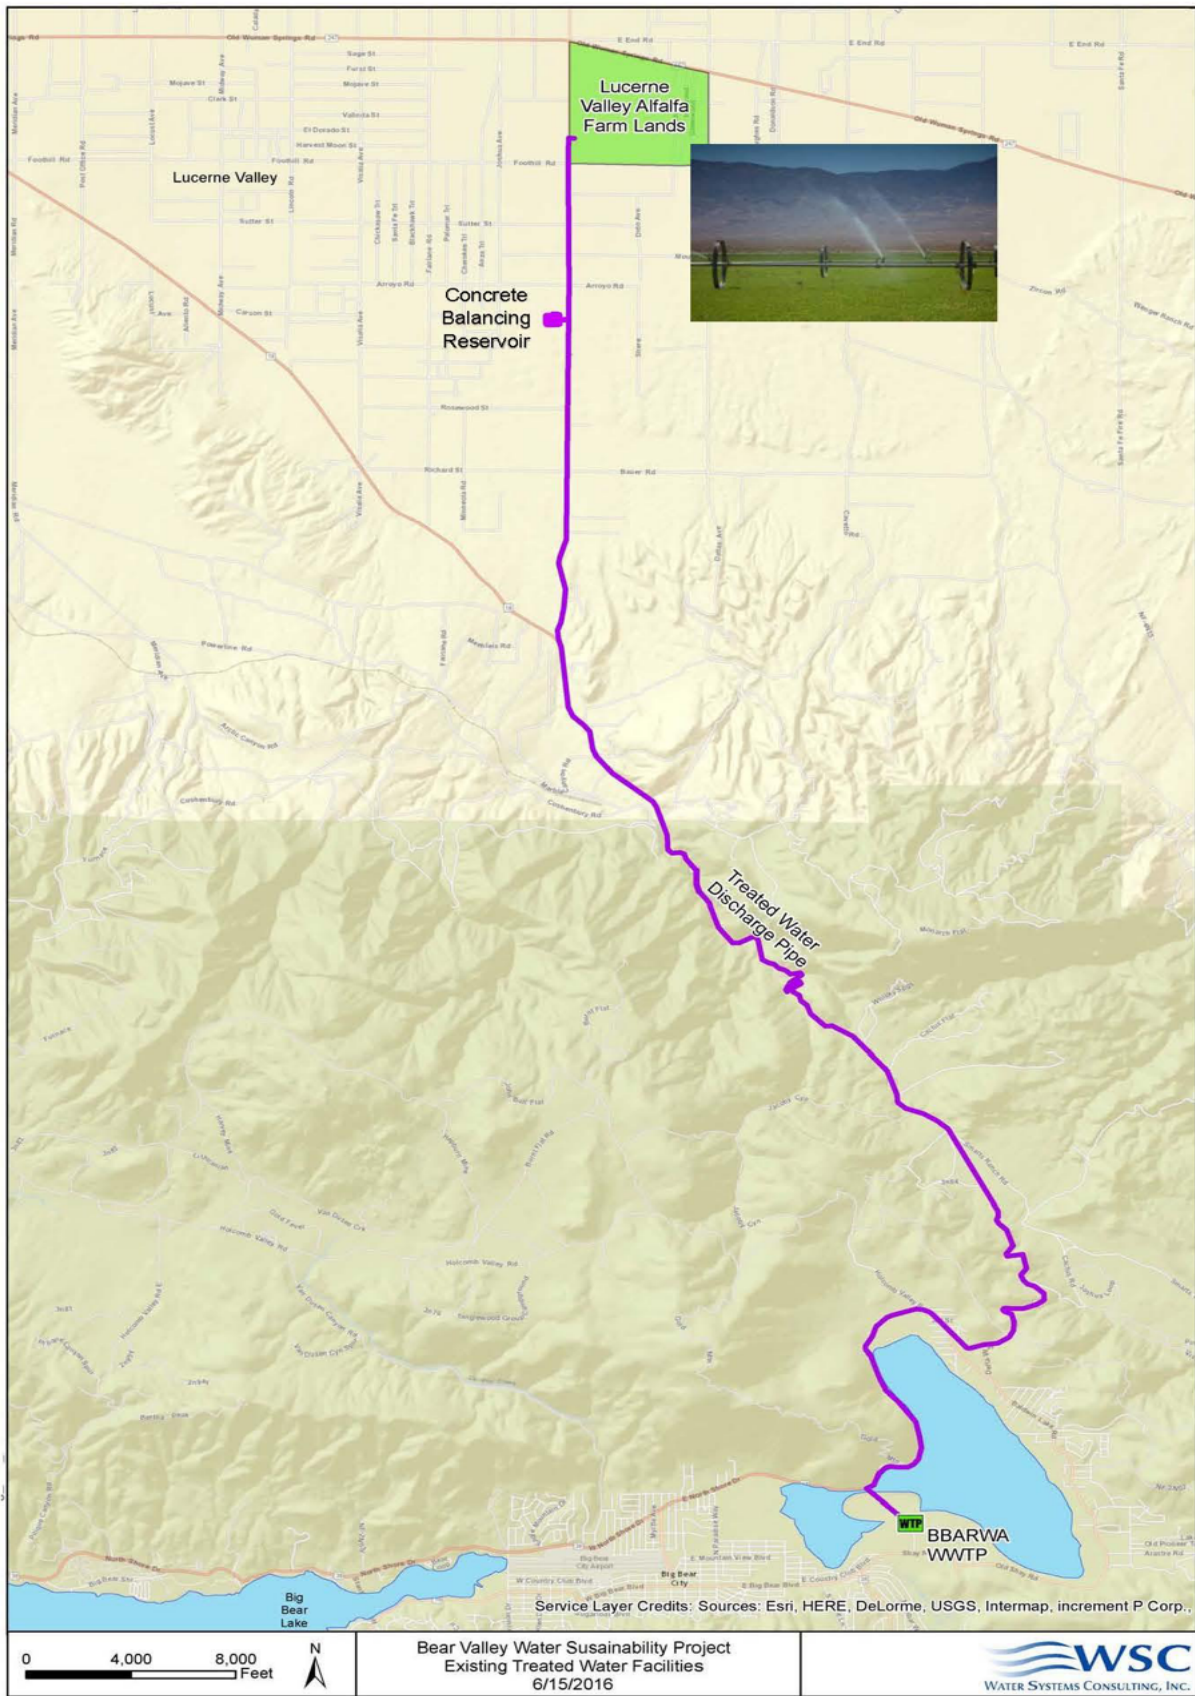

According to the U. S. Department of Agriculture (USDA) Web Soil Survey,²³ the BBARWA LV Site consists of two soil mapped units, Cajon sand, 0 to 2 percent slopes (Unit 112) and Kimberlina loamy fine sand, cool, 0 to 23 percent slopes (Unit 137). As shown on **Figure 4.3-2**, approximately 82% of the 480 acres is Cajon and about 18% is Kimberlina. The aerial photograph used for the soil map were compiled from 1976 through 1978, which is prior to the initiation of agricultural operations at the BBARWA property, which began in 1980.

The NRCS Soil Classifications²⁴ are as follows:

- **Class I (1)** soils have slight limitations that restrict their use.
- **Class II (2)** soils have moderate limitations that reduce the choice of plants or require moderate conservation practices.
- **Class III (3)** soils have severe limitations that reduce the choice of plants or require special conservation practices, or both.
- **Class IV (4)** soils have very severe limitations that restrict the choice of plants or require very careful management, or both.

FIGURE 4.3-2

Soil Map—San Bernardino County, California, Mojave River Area
(BWA-181 Soils Map)

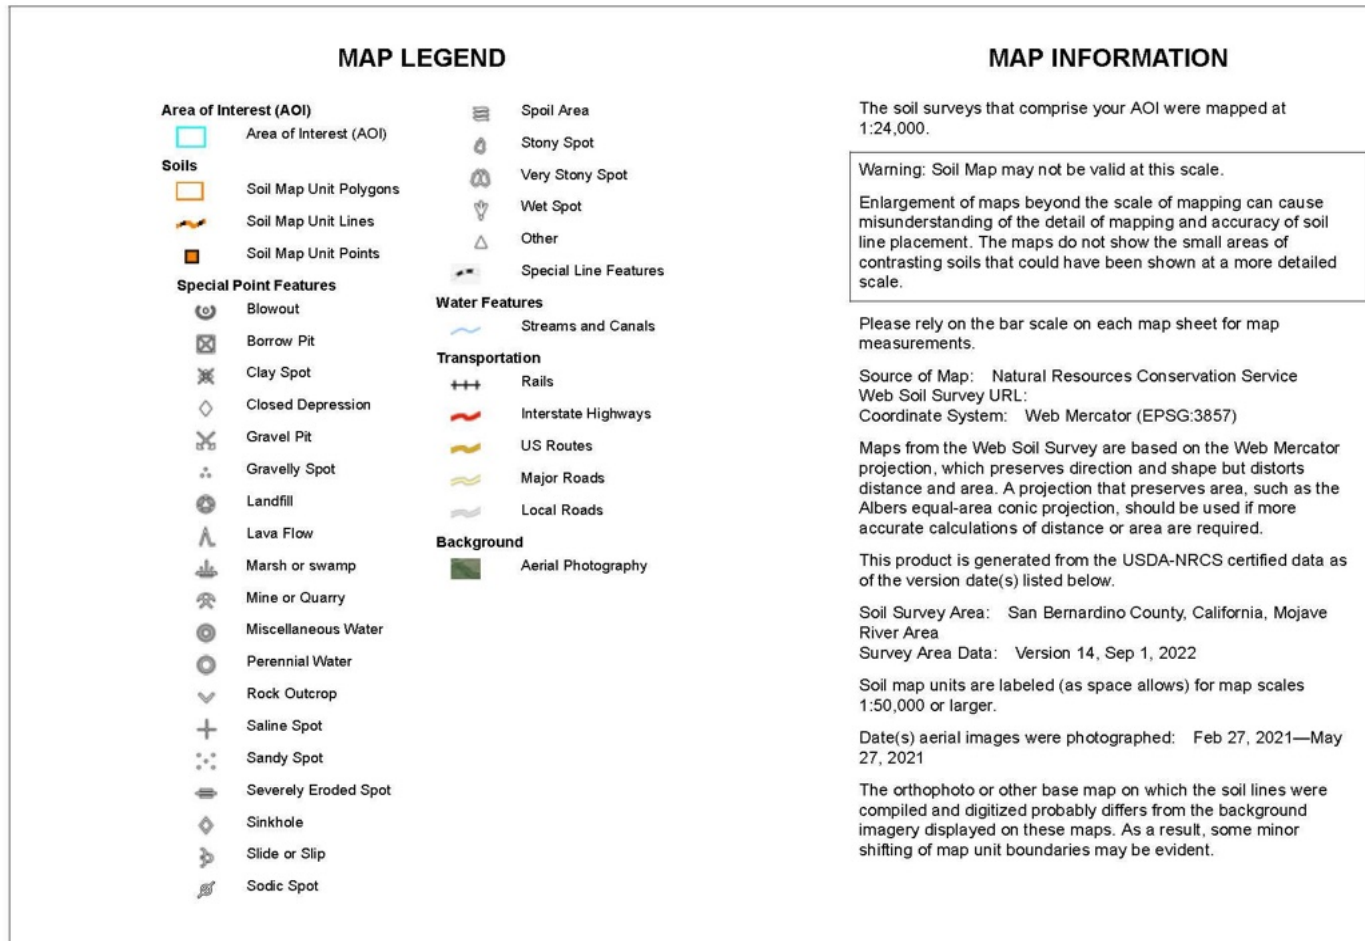

FIGURE 4.3-2

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
112	CAJON SAND, 0 TO 2 PERCENT SLOPES	368.5	66.2%
113	CAJON SAND, 2 TO 9 PERCENT SLOPES	89.7	16.1%
137	KIMBERLINA LOAMY FINE SAND, COOL, 0 TO 2 PERCENT SLOPES	98.3	17.7%
Totals for Area of Interest		556.6	100.0%

- **Class V (5)** soils have little or no hazard of erosion but have other limitations, impractical to remove, that limit their use mainly to pasture, range, forestland, or wildlife food and cover.
- **Class VI (6)** soils have severe limitations that make them generally unsuited to cultivation and that limit their use mainly to pasture, range, forestland, or wildlife food and cover.
- **Class VII (7)** soils have very severe limitations that make them unsuited to cultivation and that restrict their use mainly to grazing, forestland, or wildlife.
- **Class VIII (8)** soils and miscellaneous areas have limitations that preclude their use for commercial plant production and limit their use to recreation, wildlife, or water supply or for esthetic purposes.

NRCS Soil Classifications Subclasses and Definitions are as follows:

- **Subclass e** is made up of soils for which the susceptibility to erosion is the dominant problem or hazard affecting their use. Erosion susceptibility and past erosion damage are the major soil factors that affect soils in this subclass.
- **Subclass w** is made up of soils for which excess water is the dominant hazard or limitation affecting their use. Poor soil drainage, wetness, a high-water table, and overflow are the factors that affect soils in this subclass.
- **Subclass s** is made up of soils that have soil limitations within the rooting zone, such as shallowness of the rooting zone, stones, low moisture-holding capacity, low fertility that is difficult to correct, and salinity or sodium content.
- **Subclass c** is made up of soils for which the climate (the temperature or lack of moisture) is the major hazard or limitation affecting their use.

Utilizing the definitions above, the Cajon sands are designated capability unit IIIe-1 when irrigated and capability VIIe when not irrigated. Kimberlina loamy fine sands are designated capability unit IIe-1 when irrigated and capability VIIe when not irrigated. Thus, when irrigated Kimberlina soil would be considered a prime agricultural soil and the Cajon soil would be considered a non-prime agricultural soil. However, without irrigation both soils would be considered non-prime agricultural soils (VIIe).

Based on the current/recent condition of BBARWA's LV Site and irrigated field crop production, the San Bernardino Countywide Plan (**Figure 4.3-3**) and the California Important Farmland Finder (**Figure 4.3-4**) identify the site as being Prime Farmland and Farmland of Statewide importance. These designations indicate that under present circumstances (water available for irrigation and active farming), the LV Site is considered to be important farmland.

4.3.2.2 Forestry

The SBNF both surrounds and intermixes with developed communities in the Big Bear Valley. California Public Resources Code paragraph 12220(g) defines "Forest Land" as "land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits." Under this definition almost all of the woodland areas within Big Bear Valley, both incorporated and unincorporated, may qualify as "forest land."

4.3.3 Regulatory Setting

State and local laws, regulations, plans, and guidelines that are applicable to the proposed Program are summarized below.

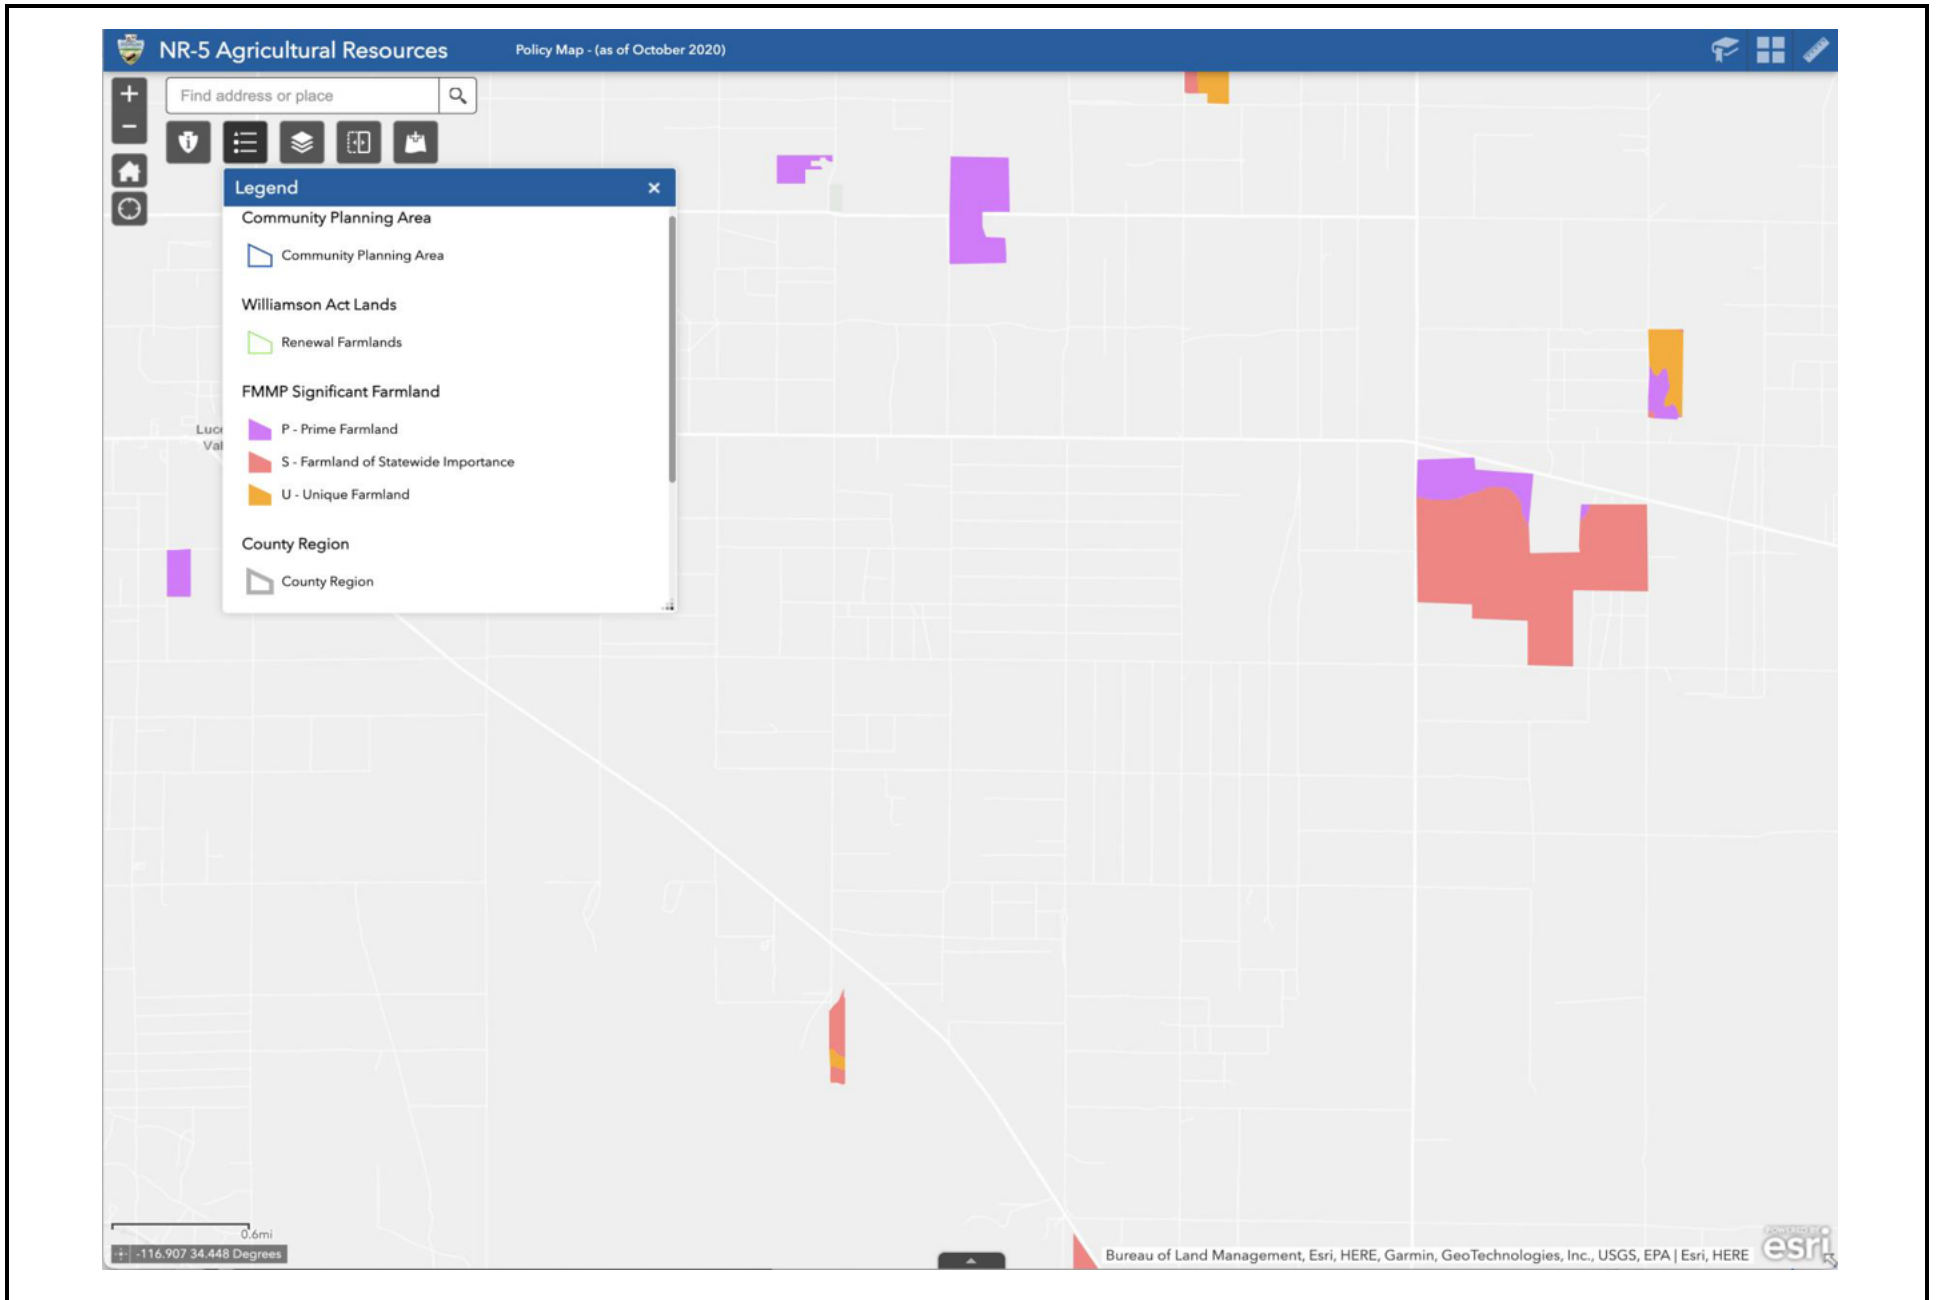

FIGURE 4.3-3

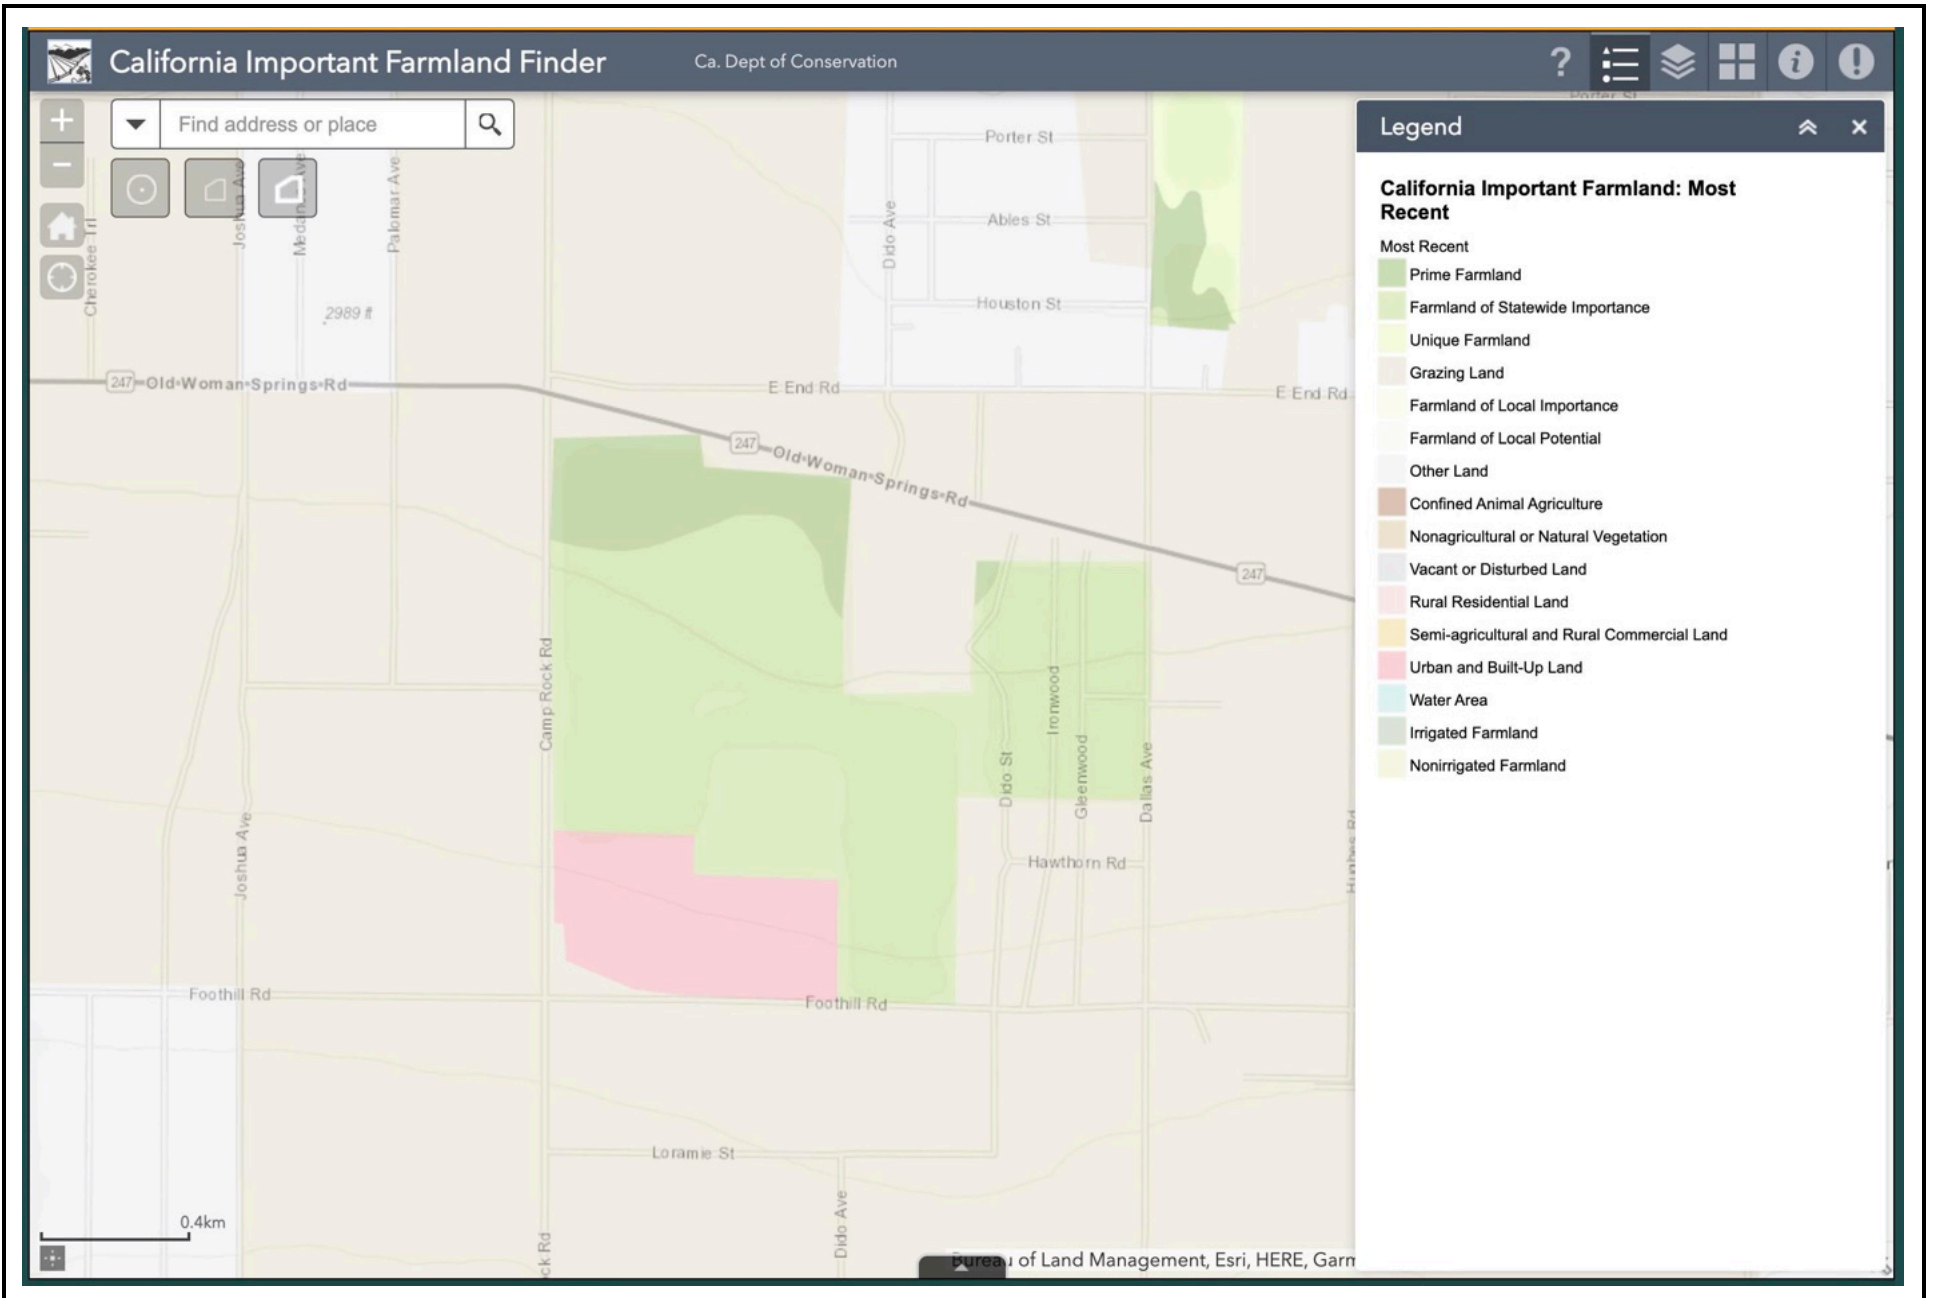

FIGURE 4.3-4

4.3.3.1 State

California Farmland Mapping and Monitoring Program

The California Department of Conservation (DOC), under the Division of Land Resource Protection, has established the Farmland Mapping and Monitoring Program (FMMP). The FMMP monitors the conversion of the State's farmland to and from agricultural use. The map series identifies eight classifications and uses a minimum mapping unit size of 10 acres. The FMMP also produces a biannual report on the amount of land converted from agricultural to non-agricultural use. The FMMP maintains an inventory of State agricultural land and updates its "Important Farmland Series Maps" every two years. Important farmlands are divided into the following five categories based on their suitability for agriculture:

- **Prime Farmland.** Prime Farmland is land with the best combination of physical and chemical characteristics able to sustain long-term production of agricultural crops. This land has produced irrigated crops at some times within the four years prior to the mapping date.
- **Farmland of Statewide Importance.** Farmland of Statewide Importance is land that meets the criteria for Prime Farmland but with minor shortcomings such as greater slopes or lesser soil moisture capacity.
- **Unique Farmland.** Unique Farmland has even lesser quality soils and produces the State's leading agricultural crops. This land is usually irrigated, but also includes non-irrigated orchards and vineyards.
- **Farmland of Local Importance.** Farmland of Local Importance is land that is important to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
- **Grazing Land.** Grazing Land is land on which the existing vegetation is suited to the grazing of livestock.

Williamson Act

The Williamson Act, is designed to preserve agricultural and open space lands by discouraging their premature and unnecessary conversion to urban uses. Williamson Act contracts, also known as agricultural preserves, create an arrangement whereby private landowner's contract with counties and cities to voluntarily restrict their land to agricultural and compatible open-space uses. The Big Bear Valley has no Williamson Act contracts in place. However, the Lucerne Valley does have Williamson Act contracts in place.

California Public Resources Code Section 12220(g)

The California Public Resources Code defines "forest land" under section 12220(g) as land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. Projects are subject to this code if there are any potentially significant changes to existing areas zoned as forest land.

California Public Resources Code Section 4526

The California Public Resources Code defines "timberland" as land, other than land owned by the Federal government and land designated as experimental forest land, which is available for, and capable of, growing a crop of trees of any commercial species used to produce lumber and other forest products, including Christmas trees. Commercial species shall be determined after consultation with the appropriate State district. Projects may have significant impacts to timberland if the project conflicts with existing zoning.

California Government Code Section 51104(g)

The California Government Code defines “timberland production zone” under Section 51104(g) as an area which has been zoned pursuant to Sections 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h) of the Government Code 51104. Projects may significantly impact timberland resources if a project conflicts with existing areas zoned for timberland production.

California Land Evaluation and Site Assessment Model

The Land Evaluation and Site Assessment (LESA) is a point-based approach for rating the relative importance of agricultural land based upon specific measurable features.

The California LESA Model was developed to provide lead agencies with an optional methodology to ensure that potentially significant effects on the environment of agricultural land conversions are quantitatively and consistently considered in the environmental review process (California Public Resources Code Section 21095), including in CEQA reviews.

The California LESA Model evaluates measures of soil resource quality, a given project’s size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands. For a given project, the factors are rated, weighted, and combined, resulting in a single numeric score. The project score becomes the basis for making a determination of a project’s potential significance.

4.3.3.2 Local

The Big Bear Valley area encompasses multiple jurisdictions including unincorporated areas of San Bernardino County, one incorporated City, -City of Big Bear Lake, USDA, and the SBNF. Unincorporated areas in the Big Bear Valley include Fawnskin, Big Bear City, Sugarloaf, Baldwin Lake, Lake Williams, and Erwin Lake.

San Bernardino Countywide Plan

The San Bernardino Countywide Plan identifies areas of prime and non-prime agricultural soils and operations to establish areas where agriculture and compatible uses may coexist with development, identified as Agriculture Zoning Districts.

The Natural Resources Element of the San Bernardino Countywide Plan includes the following goal and policies regarding agriculture that may be applicable to Program activities within the unincorporated areas of Big Bear Valley.

The Countywide Plan Natural Resources Element sets forth the following goal and policies pertaining to agriculture:

Goal	NR-7	Agriculture and Soils. The ability of property owners, farmers, and ranchers to conduct sustainable and economically viable agricultural operations.
Policy	NR-7.1	Protection of agricultural land. We protect economically viable and productive agricultural lands from the adverse effects of urban encroachment, particularly increased erosion and sedimentation, trespass, and non-agricultural land development.

- NR-7.2 Preservation of Important Farmlands. We require project applicants seeking to develop 20 or more acres of farmland (classified as prime, of statewide importance, or unique farmland) to non-agricultural uses to prepare an agricultural resource evaluation prior to project approval. The evaluation shall use generally accepted methodologies to identify the potentially significant impact of the loss of agricultural land as well as the economic viability and sustainability of future agricultural use of the property, including long-term sustainability and economic viability of water resources. If the conversion is deemed significant, the County shall require mitigation at a 1:1 ratio of converted to preserved acreage through conservation easements, payment of its valuation equivalent if a fee mitigation program is established, or inclusion in a regional agricultural preservation program.
- NR-7.3 Conservation and preservation incentives. We support programs and policies that provide tax and economic incentives to conserve existing productive agricultural lands or preserve farmland classified as prime, of statewide importance, unique, or of local importance. We support land owners in establishing new and maintaining existing California Land Conservation (Williamson Act) contracts.

Thus, where agricultural soils occur or activities exist, San Bernardino County has policies to support them.

No policies were found in the San Bernardino County Countywide Plan regarding forestry or timberland resources.

Big Bear Lake General Plan

No policies were found in the City of Big Bear Lake General Plan regarding agricultural resources or forestry or timberland resources.

4.3.4 Thresholds of Significance

According to Appendix G of the State CEQA Guidelines, a project would normally have a significant effect on the environment if the project would:

- a) Convert Prime Farmland, Unique Farmland or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.
- b) Conflict with existing zoning for agricultural use or a Williamson Act contract.
- c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in California Public Resources Code section 12220(g)), timberland (as defined by California Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).
- d) Result in the loss of forest land or conversion of forest land to non-forest use.
- e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

4.3.5 Potential Impacts

- a) **Would the project convert Prime Farmland, Unique Farmland or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

Combined Program Categories

Construction and Operation: The Program Area contains no known agricultural resources or resource values, including prime or important farmland resources in the Big Bear Valley. A field

review of the proposed Program locations (shown on **Figures 3-2 through 3-17, 3-19, 3-22, 3-26, 3-29, 3-30, 3-31, 3-33, and 3-34**) substantiates that the project specific facilities will not adversely impact any agricultural resources. Thus, no impact to any agricultural resources will occur in Big Bear Valley from implementation of the Program. No mitigation is required.

Other Physical Changes

The situation in Lucerne Valley is different because there are substantial agricultural resources—Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. As described under the existing conditions, the San Bernardino Countywide Plan (**Figure 4.3-3**) and the California Important Farmland Finder (**Figure 4.3-4**) identify the LV Site as being Prime Farmland and Farmland of Statewide Importance. These designations indicate that under present circumstances (water available for irrigation and active farming), the LV Site is considered to be important farmland. BBARWA currently discharges approximately up to 2,200 AFY of undisinfected secondarily treated wastewater to the 480-acre property it owns in Lucerne Valley as shown on **Figure 4.2-1**. The proposed Program will substantially reduce the volume of treated effluent discharged at BBARWA's LV Site. Once fully operational, in dry a dry year, BBARWA could send no water to the LV Site, and in a wet year like 2011, it could send up to 1,050 AFY, which could be used to irrigate grain or other alternative use/disposal. BBARWA anticipates discharging an average of about 340 AFY of undisinfected secondarily treated effluent during winter months from December through May. Discussions with the contract farmer indicate that during the winter months, it may be possible to grow grain(s) on approximately 40 acres of the LV Site. If the continuation of farming at the LV Site is infeasible due to lack of sufficient water, lack of sufficient demand for the crop, or is infeasible due to cost of continuing the farming operation by the farmer, BBARWA would either use the LV Site unlined discharge basins (**Figure 3-35**) to handle the 340 AFY of undisinfected secondarily treated effluent or could make the treated effluent available to another party for an alternative use.

At present, a 190-acre portion of the LV Site is farmed at present within the 480-acre LV Site. Under the Program, and scenario described above, 40 acres of land would continue to be farmed, removing about 150 acres of utilized designated Prime Farmland or Farmland of Statewide Importance (refer to **Figures 4.3-2, 4.3-3 and 4.3-4**) from production. If the LV site cannot continue to be farmed due to lack of sufficient water, lack of sufficient demand for the crop, or is infeasible due to cost of continuing the farming operation by the farmer, or, if BBARWA ultimately pursues alternative uses for the treated effluent, an estimated total of 190-acres of Farmland, about 40% of the site, would be removed from production. Further, since the purpose of farming at the site to date has been to reuse the water until recycling in Big Bear Valley would be feasible, BBARWA does not anticipate continuing any crop production at the site using groundwater because of the limited water rights available in the Lucerne Valley Basin. The Lucerne Valley Basin was adjudicated as a result of the MBA Judgment in 1996. Thus, the probable loss of 190 acres or more of existing agricultural production due to the Program is considered a significant impact to Prime Farmland and Farmland of Statewide Importance.

Under the proposed Program, no feasible mitigation is available to account for this loss of Prime Farmland and Farmland of Statewide Importance. The removal of the source of water to support agricultural production at the BBARWA site is an unavoidable consequence of the proposed Program. Additionally, BBARWA has considered utilizing agricultural conservation easements to mitigate the significant loss of farmland identified in the DPEIR. Since there are no other feasible mitigation measures, utilization of an agricultural easement would not be able to fully mitigate the impact to a level of less than significant. Thus, this concept was deemed infeasible because it would neither fully reduce the significant impact to a level of less than significant, nor would it be logical to consider payment towards or creation of offsite agricultural conservation easements in

this instance. This is because the Program would not eliminate the future potential for this land to return to agricultural production, but based on water availability at the LV Site, the continuation of farming 190-acres would likely be infeasible. Thus, the employment of offsite agricultural conservation easements was deemed impractical, and furthermore, would not fully offset significant agricultural impacts. As stated above, BBARWA's removal of the undisinfected secondary treated effluent would effectively remove the available water supply enabling the LV Site to remain Prime Farmland and Farmland of Statewide Importance, as an irrigated water source is needed to retain this designated based on the soils underlying the site. BBARWA does not hold any water rights in the MBA, or more specifically in the Lucerne Valley Basin, and therefore, the use of groundwater to continue agricultural production within this site is infeasible. The water availability in Lucerne Valley is discussed further in detail under **Subchapter 4.11**, Hydrology and Water Quality. Ultimately, with implementation of the Program, the 190 acres of Prime Farmland and Farmland of Statewide Importance under agricultural production at the LV Site will be allowed to lie fallow in the future. The potential for this fallow land to function as a source of fugitive dust in the future is addressed in the Air Quality section, **Subchapter 4.4**.

Level of Significance Before Mitigation: Potentially Significant

*Mitigation Measures: No feasible **MMs** exist to avoid this significant impact.*

Level of Significance After Mitigation: Significant and Unavoidable

b) Would the project conflict with existing zoning for agricultural use or a Williamson Act contract?

Combined Program Categories

Construction & Operation: Neither the City of Big Bear Lake nor San Bernardino County have designated agricultural land designation or zoning within the Big Bear Valley. Therefore, no potential conflicts will occur with existing zone classifications or Williamson Act contracts from implementation of the Program. No impacts are anticipated under this issue.

Other Physical Changes

The LV Site is also not zoned for agriculture. Limited agricultural or horticultural land uses could be developed under the Rural Residential and Open Space land use designations, but no such uses occur within the footprint of the facilities proposed for implementation under the proposed Program. Therefore, the Big Bear Valley contains no land under Williamson Act contract. Further, no changes in land use designations are required to support the proposed recycled water facilities shown on referenced maps under issue a) above. As shown on **Figure 4.3-3**, the LV Site is not considered a Williamson Act, thus the change in farmland production at the site will have no potential to conflict with a Williamson Act contract. Therefore, no potential conflicts will occur with existing zone classifications or Williamson Act contracts from implementation of the Program. No impacts are anticipated under this issue.

Level of Significance Before Mitigation: No Impact

Mitigation Measures: None required

c) Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in California Public Resources Code section 12220(g)), timberland (as defined by California Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

Combined Program Categories

A review of the land use designations within the Program Area of impact (reference maps identified in issue (a), above) indicates that there are no areas designated or classified as forest land or timberland in accordance with the referenced California Public Resources Code sections. At this time, it appears that none of the facilities will be located on land managed by SBNF, no Federal land managed for forest or timber land production will be affected by the proposed Program. Therefore, the proposed Program has no potential to conflict with existing zoning or to cause rezoning of forest or timber land. No impacts are anticipated under this issue.

Level of Significance Before Mitigation: No Impact

Mitigation Measures: None required

d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?

Program Category 1: Conveyance Pipelines

As described in the **Subchapter 4.2**, Aesthetics, under issue (b), the majority of the proposed Program's area of impact does not contain woodland areas that could be described as forest land. According to the San Bernardino Countywide Plan EIR an estimated 37,473 acres of forest and woodland are under San Bernardino County jurisdiction and a total of 270,704 acres of forest/woodland occur within San Bernardino County. There is only one area of the proposed Program, Sand Canyon (refer to **Figures 3-12 through 3-15**), where trees may be removed. The Sand Canyon Recharge Conveyance Pipeline has a potential to require the removal of several trees because the alignment will traverse through the two private properties as shown on **Figure 3-31**. Though the general location for the Sand Canyon Recharge Conveyance Pipeline has been established, the precise location for this short pipeline alignment is presently unknown. Thus, it is unknown precisely how many trees and what size trees will be removed as part of the installation of this Program Component. Thus, the proposed Program will be required to comply with CAL FIRE, which designates sites containing trees/timberland resources as being "timberland use," to avoid a potentially significant loss of forest land.

CAL FIRE stipulates that when a project will convert timberland to a use other than growing timber a TCP is required [California Public Resources Code 4621(a)]. Also, when projects are converting timberland to another use, the operations are considered commercial timber operations even if the logs are not being sold [California Public Resources Code 4527(a)(1) and (2)]. As such, in addition to the TCP, a THP is required for the removal of the timber [California Public Resources Code 4581]. CAL FIRE offers a number of exemptions that would apply to the proposed Program, removing the TCP and THP as requirements to implement the proposed Program. However, in a phone conversation with CAL FIRE staff member on March 1, 2023, staff indicated that an agency or entity can only apply for one exemption in a 5-year period. Thus, it is anticipated that, should BBARWA or any other partner agency itself need to apply for more than one exemption for this project, a full THP and TCP would be required to be prepared for each individual Program facility requiring removal of trees/timberland following the first exemption application. Preparation of a full THP would ensure full compliance with CAL FIRE regulations, and would ensure that the TCP would be awarded, in the event that an exemption cannot be obtained. These exemptions are the "Public Agency, Public and Private Utility Right of Way Exemption"²⁵ and the "Less Than 3 Acre

²⁵ State of California Department of Forestry and Fire Protection: Notice of timber operations that are exempt from conversion and timber harvesting plan requirements rm-73 (1104.1(b)(c):
https://www.fire.ca.gov/media/o1mpuojj/caltrees-utility-row-exemption-form_rev112020.pdf

Conversion Exemption.”²⁶ If the proposed Program does not comply with CAL FIRE regulations, a potentially significant impact to forest land and timberland could occur. Thus, proposed Program will be required to comply with **MM AGF-1** by submitting an application for one of the above exemptions or preparing a THP and TCP to remove clusters of trees subject to CAL FIRE regulations, which would avoid a potentially significant impact on forest land. With implementation of **MM AGF-1** potential impacts to forest land or timberland can be reduced to a less than significant impact level.

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

As described in the **Subchapter 4.2**, Aesthetics, under issue (b), the majority of the proposed Program’s area of impact does not contain woodland areas that could be described as forest land. According to the San Bernardino Countywide Plan EIR an estimated 37,473 acres of forest and woodland are under San Bernardino County jurisdiction and a total of 270,704 acres of forest/woodland occur within San Bernardino County. None of these areas occurs within the known Ancillary Facility sites. Additionally, while the locations of the two Sand Canyon Monitoring Wells are presently unknown, BBARWA and the Program Team will avoid impacting trees/timberland through either site design or site selection as part of the development process for the monitoring wells may also impact trees/timberland. Thus, the proposed Program will be required to comply with CAL FIRE, which designates sites containing trees/timberland resources as being “timberland use,” to avoid a potentially significant loss of forest land. As no trees would be forestry would be impacted by this Program Category, no impacts are anticipated.

Program Category 3: Solar Evaporation Ponds

As described in the **Subchapter 4.2**, Aesthetics, under issue (b), the majority of the proposed Program’s area of impact does not contain woodland areas that could be described as forest land. According to the San Bernardino Countywide Plan EIR an estimated 37,473 acres of forest and woodland are under San Bernardino County jurisdiction and a total of 270,704 acres of forest/woodland occur within San Bernardino County. None of these areas occurs within the BBARWA WWTP, and therefore, as no trees would be forestry would be impacted by this Program Category, no impacts are anticipated.

Program Category 4: BBARWA WWTP Upgrades

As described in the **Subchapter 4.2**, Aesthetics, under issue (b), the majority of the proposed Program’s area of impact does not contain woodland areas that could be described as forest land. According to the San Bernardino Countywide Plan EIR an estimated 37,473 acres of forest and woodland are under San Bernardino County jurisdiction and a total of 270,704 acres of forest/woodland occur within San Bernardino County. None of these areas occurs within the BBARWA WWTP, and therefore, as no trees would be forestry would be impacted by this Program Category, no impacts are anticipated.

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures:

AGF-1: *Should the removal of clusters of trees subject to CAL FIRE timberland conversation regulations be required for a specific Program Component, the implementing agency shall comply with CAL FIRE regulations, specifically, prior to the removal of any trees subject to CAL FIRE regulations for a given Program Component, the implementing*

²⁶ State of California Department of Forestry and Fire Protection: Notice of timber operations that are exempt from conversion and timber harvesting plan requirements rm-73 (1104.1(a):
<https://www.fire.ca.gov/media/30xkpwxc/caltrees-less-than-3-acre-conversion-exemption-form.pdf>

agency shall obtain an exemption, a “Public Agency, Public and Private Utility Right of Way Exemption” (1104.1(b)(c)) or a “Less Than 3 Acre Conversion Exemption” (1104.1(a)). Should an exemption for the removal of trees subject to CAL FIRE timberland conversation regulations be unavailable due to the limitations set forth by CAL FIRE of one exemption per agency per five years, the implementing agency shall prepare and submit a Timberland Conversion Permit (TCP) pursuant to California Public Resources Code 4621(a) and a Timber Harvesting Plan (THP) pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.

Level of Significance After Mitigation: Less Than Significant

- e) **Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion to forest land to non-forest use?**

Program Category 1: Conveyance Pipelines

Construction: Based on the lack of farmland in the Big Bear Valley, there is no potential for the construction of the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

There is a limited area (currently not defined, but estimated to be less than one acre) within the Sand Canyon Recharge Area that may experience the loss of existing trees (forest land) causing a conversion to non-forest use (i.e., pipeline alignment, monitoring well). If the proposed Program does not comply with CAL FIRE regulations, a potentially significant impact related to conversion of forest land to non-forest use could occur as a result of construction. Thus, the proposed Program will be required to comply with **MM AGF-1** by submitting an application for one of the above exemptions or preparing a THP and TCP to remove clusters of trees subject to CAL FIRE regulations, which would avoid a potentially significant impact related to conversion of forest land to non-forest use. The implementing agency will confer with CAL FIRE to implement **MM AGF-1**, which would avoid a significant impact related to conversion of forest land to non-forest use. With implementation of this measure the impact to forest land from construction will result in a less than significant impact to forest land. The loss of a less than one acre of forest land in the Sand Canyon Recharge Area will be less than significant through the implementation of **MM AGF-1**.

Operation: Based on the lack of farmland in the Big Bear Valley, there is no potential for the operation of the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

The proposed Program would not result in conversion of forest land to non-forest use as part of operations. As the operation of the conveyance pipelines would not include any that of a timberland operation, and no forest land would be altered as a result of operations, there is no potential for the operation of the proposed Program to cause conversion of forest land to non-forest use in this area that would be modified as a result of implementation of this Program Category. No impacts are anticipated.

Program Category 2: Ancillary Facilities including Monitoring Wells and Pump Stations

Construction: Based on the lack of farmland in the Big Bear Valley, there is no potential for the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

As no trees would be forestry would be impacted by construction of this Program Category, no impacts are anticipated.

Operation: Based on the lack of farmland in the Big Bear Valley, there is no potential for the operation of the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

The proposed Program would not result in conversion of forest land to non-forest use as part of operations. As the operation of this Program Category would not include any that of a timberland operation, and no forest land would be altered as a result of operations, there is no potential for the operation of the proposed Program to cause conversion of forest land to non-forest use in this area that would be modified as a result of implementation of this Program Category. No impacts are anticipated.

Program Category 3: Solar Evaporation Ponds

Construction: Based on the lack of farmland in the Big Bear Valley, there is no potential for the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

As no trees would be forestry would be impacted by construction of this Program Category, no impacts are anticipated.

Operation: Based on the lack of farmland in the Big Bear Valley, there is no potential for the operation of the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

The proposed Program would not result in conversion of forest land to non-forest use as part of operations. As the operation of this Program Category would not include any that of a timberland operation, and no forest land would be altered as a result of operations, there is no potential for the operation of the proposed Program to cause conversion of forest land to non-forest use in this area that would be modified as a result of implementation of this Program Category. No impacts are anticipated.

Program Category 4: BBARWA WWTP Upgrades

Construction: Based on the lack of farmland in the Big Bear Valley, there is no potential for the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

As no trees would be forestry would be impacted by construction of this Program Category, no impacts are anticipated.

Operation: Based on the lack of farmland in the Big Bear Valley, there is no potential for the operation of the proposed Program to cause conversion of farmland to non-agricultural use in this area that would be modified as a result of implementation of this Program Category.

The proposed Program would not result in conversion of forest land to non-forest use as part of operations. As the operation of this Program Category would not include any that of a timberland operation, and no forest land would be altered as a result of operations, there is no potential for the operation of the proposed Program to cause conversion of forest land to non-forest use in this area that would be modified as a result of implementation of this Program Category. No impacts are anticipated.

Other Physical Changes

As noted under issue (a), above, the reduction of treated effluent discharges at the LV Site will result in the removal from production of an estimated total of 190-acres of Prime Farmland and Farmland of Statewide Importance, equal to about 40% of the LV Site. Where the farmer maintains farming operations utilizing the treated effluent discharge from the LV Site, the proposed Program would result in the removal from production of an estimated total of 150-acres of Prime Farmland and Farmland of Statewide Importance. This impact is considered significant and unavoidable.

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures: No feasible MMs exist to avoid a significant impact from the conversion of agricultural lands. MM AGF-1 is required to reduce the significant impact to forest land.

AGF-1: *Should the removal of clusters of trees subject to CAL FIRE timberland conversation regulations be required for a specific Program Component, the implementing agency shall comply with CAL FIRE regulations, specifically, prior to the removal of any trees subject to CAL FIRE regulations for a given Program Component, the implementing agency shall obtain an exemption, a “Public Agency, Public and Private Utility Right of Way Exemption” (1104.1(b)(c)) or a “Less Than 3 Acre Conversion Exemption” (1104.1(a)). Should an exemption for the removal of trees subject to CAL FIRE timberland conversation regulations be unavailable due to the limitations set forth by CAL FIRE of one exemption per agency per five years, the implementing agency shall prepare and submit a Timberland Conversion Permit (TCP) pursuant to California Public Resources Code 4621(a) and a Timber Harvesting Plan (THP) pursuant to California Public Resources Code 4581 to CAL FIRE utilizing the services of a Registered Professional Forester approved by CAL FIRE.*

Level of Significance After Mitigation: Significant and Unavoidable

4.3.6 Cumulative Impacts

The proposed Program will not cause any adverse impacts to agricultural land in Big Bear Valley and very minimal impact to forest land (a few acres at most). Based on the minimal impacts to these resources from implementing the proposed Program, the cumulative impacts of the proposed Program are determined to not result in a considerable contribution to cumulative impacts to agricultural and forestry resources within the Big Bear Valley following implementation of the single MM.

However, the conversion of up to 190 acres of designated agricultural land at BBARWA’s LV Site is a necessary in order to implement the Program, and thereby utilize the majority of the wastewater generated in Big Bear Valley locally as Program Water, rather than exporting the whole of the secondary effluent generated by the BBARWA WWTP process to Lucerne Valley. Thus, the conversion of up to 190 acres of designated agricultural land at BBARWA’s LV Site is considered sufficient to contribute to Statewide cumulative loss of agricultural land. Therefore, the proposed Program has potential to result in a cumulatively considerable adverse contribution to any cumulative agricultural resource impacts. Thus, cumulative adverse impacts to agricultural resources are significant and unavoidable. However, with implementation of mitigation impacts to forestry resources are considered less than cumulatively considerable, and therefore are less than significant.

4.3.7 Unavoidable Adverse Impacts

As determined in the preceding evaluation, with the implementation of mitigation, the proposed Program would not result in significant and unavoidable forestry resources impacts. The proposed Program will cause project specific and cumulative unavoidable significant impacts to agricultural resources.

4.4 AIR QUALITY

4.4.1 Introduction

This section assesses potential impacts to air quality from implementation of the Replenish Big Bear Program (Program). The Replenish Big Bear Program Air Quality Impact Analysis (AQIA) dated August 2023 was prepared by Urban Crossroads, Inc. (Urban Crossroads) to evaluate the potential impacts to air quality associated with construction and operation of the facilities proposed as part of the Program. A copy of the AQIA is provided as **Appendix 11 of Volume 2** to this DPEIR.

The AQIA quantifies air quality emissions generated by construction and operation of the Program and addresses whether the Program conflicts with implementation of the SCAQMD AQMP and Lead Agency planning regulations. The analysis of Program-generated air emissions determines whether the Program would result in a cumulatively considerable net increase of any criteria pollutant for which the South Coast Air Basin (SCAB) is in non-attainment under an applicable NAAQS and CAAQS. Additionally, the Program has been evaluated to determine whether the Program would expose sensitive receptors to substantial pollutant concentrations and the impacts of odors. The significance of these potential impacts is described in the following sections. Much of the information provided in the following sections is abstracted directly from the AQIA with minor edits.

These issues will be discussed below as set in the following framework:

- Introduction
- Environmental Setting: Air Quality
- Regulatory Setting
- Thresholds of Significance
- Potential Impacts
- Cumulative Impacts
- Unavoidable Adverse Impacts

No comments pertaining to air quality were received at the Scoping Meeting held on behalf of the Program. Three comment letters specific to this topic were received in response to the NOP. NOP Comment Letters can be found in **Subchapter 8.2**, responses to comments can be found **Subchapter 8.3**.

4.4.2 Environmental Setting: Air Quality

Note that all references provided herein can be found in the AQIA prepared by Urban Crossroads provided as **Appendix 11, Volume 2** to this DPEIR.

4.4.2.1 South Coast Air Basin

The Big Bear Valley is located in the SCAB, which is under the jurisdiction of the SCAQMD. The SCAB is a 6,745-square-mile region bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The SCAB includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the San Geronio Pass area in Riverside County.

4.4.2.2 Regional Climate and Wind Patterns

The regional climate has a substantial influence on air quality in the SCAB. In addition, the temperature, wind, humidity, precipitation, and amount of sunshine influence the air quality.

The annual average temperatures throughout the SCAB vary from the low to middle 60s degrees Fahrenheit (°F). Due to a decreased marine influence, the eastern portion of the SCAB shows greater variability in average annual minimum and maximum temperatures. January is the coldest month throughout the SCAB, with average minimum temperatures of 47°F in downtown Los Angeles and 36°F in San Bernardino. All portions of the SCAB have recorded maximum temperatures above 100°F.

Although the climate of the SCAB can be characterized as semi-arid, the air near the land surface is quite moist on most days because of the presence of a marine layer. This shallow layer of sea air is an important modifier of SCAB climate. Humidity restricts visibility in the SCAB, and the conversion of sulfur dioxide (SO₂) to sulfates (SO₄) is heightened in air with high relative humidity. The marine layer provides an environment for that conversion process, especially during the spring and summer months. The annual average relative humidity within the SCAB is 71% along the coast and 59% inland. Since the ocean effect is dominant, periods of heavy early morning fog are frequent and low stratus clouds are a characteristic feature. These effects decrease with distance from the coast.

More than 90% of the SCAB's rainfall occurs from November through April. The annual average rainfall varies from approximately nine inches in Riverside to fourteen inches in downtown Los Angeles. Monthly and yearly rainfall totals are extremely variable. Summer rainfall usually consists of widely scattered thunderstorms near the coast and slightly heavier shower activity in the eastern portion of the SCAB with frequency being higher near the coast.

Due to its generally clear weather, about three-quarters of available sunshine is received in the SCAB. The remaining one-quarter is absorbed by clouds. The ultraviolet portion of this abundant radiation is a key factor in photochemical reactions. On the shortest day of the year there are approximately 10 hours of possible sunshine, and on the longest day of the year there are approximately 14½ hours of possible sunshine.

The importance of wind to air pollution is considerable. The direction and speed of the wind determines the horizontal dispersion and transport of the air pollutants. During the late autumn to early spring rainy season, the SCAB is subjected to wind flows associated with the traveling storm fronts moving through the region from the northwest. This period also brings five to ten periods of strong, dry offshore winds, locally termed "Santa Anas" each year. During the dry season, which coincides with the months of maximum photochemical smog concentrations, the wind flow is bimodal, typified by a daytime onshore sea breeze and a nighttime offshore drainage wind. Summer wind flows are created by the pressure differences between the relatively cold ocean and the unevenly heated and cooled land surfaces that modify the general northwesterly wind circulation over southern California. Nighttime drainage begins with the radiational cooling of the mountain slopes. Heavy, cool air descends the slopes and flows through the mountain passes and canyons as it follows the lowering terrain toward the ocean. Another characteristic wind regime in the SCAB is the "Catalina Eddy," a low level cyclonic (counterclockwise) flow centered over Santa Catalina Island which results in an offshore flow to the southwest. On most spring and summer days, some indication of an eddy is apparent in coastal sections.

In the SCAB, there are two distinct temperature inversion structures that control vertical mixing of air pollution. During the summer, warm high-pressure descending (subsiding) air is undercut by a shallow layer of cool marine air. The boundary between these two layers of air is a persistent marine subsidence/inversion. This boundary prevents vertical mixing which effectively acts as an impervious lid to pollutants over the entire SCAB. The mixing height for the inversion structure is normally situated 1,000 to 1,500 feet amsl.

A second inversion-type forms in conjunction with the drainage of cool air off the surrounding mountains at night followed by the seaward drift of this pool of cool air. The top of this layer forms a sharp boundary with the warmer air aloft and creates nocturnal radiation inversions. These inversions occur primarily in the winter, when nights are longer and onshore flow is weakest. They are typically only a few hundred feet amsl. These inversions effectively trap pollutants, such as nitrogen oxides (NO_x) and carbon monoxide (CO) from vehicles, as the pool of cool air drifts seaward. Winter is therefore a period of high levels of primary pollutants along the coastline.

4.4.2.3 Criteria Pollutants

Criteria pollutants are pollutants that are regulated through the development of human health based and/or environmentally based criteria for setting permissible levels. Criteria pollutants, their typical sources, and health effects are identified below:

**Table 4.4-1
 CRITERIA POLLUTANTS**

Criteria Pollutant	Description	Sources	Health Effects
Carbon monoxide (CO)	CO is a colorless, odorless gas produced by the incomplete combustion of carbon-containing fuels, such as gasoline or wood. CO concentrations tend to be the highest during the winter morning, when little to no wind and surface-based inversions trap the pollutant at ground levels. Because CO is emitted directly from internal combustion engines, unlike ozone (O ₃), motor vehicles operating at slow speeds are the primary source of CO in the SCAB. The highest ambient CO concentrations are generally found near congested transportation corridors and intersections.	Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.	Individuals with a deficient blood supply to the heart are the most susceptible to the adverse effects of CO exposure. The effects observed include earlier onset of chest pain with exercise, and electrocardiograph changes indicative of decreased oxygen (O ₂) supply to the heart. Inhaled CO has no direct toxic effect on the lungs but exerts its effect on tissues by interfering with O ₂ transport and competing with O ₂ to combine with hemoglobin present in the blood to form carboxyhemoglobin (COHb). Hence, conditions with an increased demand for O ₂ supply can be adversely affected by exposure to CO. Individuals most at risk include fetuses, patients with diseases involving heart and blood vessels, and patients with chronic hypoxemia (O ₂ deficiency) as seen at high altitudes.
Sulfur Dioxide (SO ₂)	SO ₂ is a colorless, extremely irritating gas or liquid. It enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. When SO ₂ oxidizes in the atmosphere, it forms SO ₄ . Collectively, these pollutants are referred to as sulfur oxides (SO _x).	Coal or oil burning power plants and industries, refineries, diesel engines.	A few minutes of exposure to low levels of SO ₂ can result in airway constriction in some asthmatics, all of whom are sensitive to its effects. In asthmatics, increase in resistance to air flow, as well as reduction in breathing capacity leading to severe breathing difficulties, are observed after acute exposure to SO ₂ . In contrast, healthy individuals do not exhibit similar acute

Criteria Pollutant	Description	Sources	Health Effects
			<p>responses even after exposure to higher concentrations of SO₂. Animal studies suggest that despite SO₂ being a respiratory irritant, it does not cause substantial lung injury at ambient concentrations. However, very high levels of exposure can cause lung edema (fluid accumulation), lung tissue damage, and sloughing off of cells lining the respiratory tract. Some population-based studies indicate that the mortality and morbidity effects associated with fine particles show a similar association with ambient SO₂ levels. In these studies, efforts to separate the effects of SO₂ from those of fine particles have not been successful. It is not clear whether the two pollutants act synergistically, or one pollutant alone is the predominant factor.</p>
<p>Nitrogen oxides (NO_x)</p>	<p>NO_x consist of nitric oxide (NO), nitrogen dioxide (NO₂) and nitrous oxide (N₂O) and are formed when nitrogen (N₂) combines with O₂. Their lifespan in the atmosphere ranges from one to seven days for NO and N₂O, to 170 years for nitrous oxide. NO_x is typically created during combustion processes and are major contributors to smog formation and acid deposition. NO₂ is a criteria air pollutant and may result in numerous adverse health effects; it absorbs blue light, resulting in a brownish-red cast to the atmosphere and reduced visibility. Of the seven types of nitrogen oxide compounds, NO₂ is the most abundant in the atmosphere. As ambient concentrations of NO₂ are related to traffic density, commuters in heavy traffic may be exposed to higher concentrations of NO₂ than those indicated by regional monitoring station.</p>	<p>Any source that burns fuel such as automobiles, trucks, heavy construction equipment, farming equipment and residential heating.</p>	<p>Population-based studies suggest that an increase in acute respiratory illness, including infections and respiratory symptoms in children (not infants), is associated with long-term exposure to NO₂ at levels found in homes with gas stoves, which are higher than ambient levels found in Southern California. Increase in resistance to air flow and airway contraction is observed after short-term exposure to NO₂ in healthy subjects. Larger decreases in lung functions are observed in individuals with asthma or chronic obstructive pulmonary disease (e.g., chronic bronchitis, emphysema) than in healthy individuals, indicating a greater susceptibility of these sub-groups. In animals, exposure to levels of NO₂ considerably higher than ambient concentrations result in increased susceptibility to infections, possibly due to the observed changes in cells involved in maintaining immune functions. The severity of lung tissue damage associated with high levels of O₃ exposure increases when animals are exposed to a combination of O₃ and NO₂.</p>

Criteria Pollutant	Description	Sources	Health Effects
Ozone (O ₃)	O ₃ is a highly reactive and unstable gas that is formed when volatile organic compounds (VOCs) and NO _x , both byproducts of internal combustion engine exhaust, undergo slow photochemical reactions in the presence of sunlight. O ₃ concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable to the formation of this pollutant.	Formed when reactive organic gases (ROG) and NO _x react in the presence of sunlight. ROG sources include any source that burns fuels, (e.g., gasoline, natural gas, wood, oil) solvents, petroleum processing and storage and pesticides.	Individuals exercising outdoors, children, and people with preexisting lung disease, such as asthma and chronic pulmonary lung disease, are considered to be the most susceptible sub-groups for O ₃ effects. Short-term exposure (lasting for a few hours) to O ₃ at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes. Elevated O ₃ levels are associated with increased school absences. In recent years, a correlation between elevated ambient O ₃ levels and increases in daily hospital admission rates, as well as mortality, has also been reported. An increased risk for asthma has been found in children who participate in multiple outdoor sports and live in communities with high O ₃ levels. O ₃ exposure under exercising conditions is known to increase the severity of the responses described above. Animal studies suggest that exposure to a combination of pollutants that includes O ₃ may be more toxic than exposure to O ₃ alone. Although lung volume and resistance changes observed after a single exposure diminish with repeated exposures, biochemical and cellular changes appear to persist, which can lead to subsequent lung structural changes.
Particulate Matter (PM)	PM ₁₀ : A major air pollutant consisting of tiny solid or liquid particles of soot, dust, smoke, fumes, and aerosols. Particulate matter pollution is a major cause of reduce visibility (haze) which is caused by the scattering of light and consequently the significant reduction air clarity. The size of the particles (10 microns or smaller, about 0.0004 inches or less) allows them to easily enter the lungs where they may be deposited, resulting in adverse health	Sources of PM ₁₀ include road dust, windblown dust and construction. Also formed from other pollutants (acid rain, NO _x , SO _x , organics). Incomplete combustion of any fuel. PM _{2.5} comes from fuel combustion in motor vehicles, equipment and	A consistent correlation between elevated ambient fine particulate matter (PM ₁₀ and PM _{2.5}) levels and an increase in mortality rates, respiratory infections, number and severity of asthma attacks and the number of hospital admissions has been observed in different parts of the U.S. and various areas around the world. In recent years, some studies have reported an

Criteria Pollutant	Description	Sources	Health Effects
	<p>effects. Additionally, it should be noted that PM₁₀ is considered a criteria air pollutant.</p> <p>PM_{2.5}: A similar air pollutant to PM₁₀ consisting of tiny solid or liquid particles which are 2.5 microns or smaller (which is often referred to as fine particles). These particles are formed in the atmosphere from primary gaseous emissions that include SO₄ formed from SO₂ release from power plants and industrial facilities and nitrates that are formed from NO_x release from power plants, automobiles and other types of combustion sources. The chemical composition of fine particles highly depends on location, time of year, and weather conditions. PM_{2.5} is a criteria air pollutant.</p>	<p>industrial sources, residential and agricultural burning. Also formed from reaction of other pollutants (acid rain, NO_x, SO_x, organics).</p>	<p>association between long-term exposure to air pollution dominated by fine particles and increased mortality, reduction in lifespan, and an increased mortality from lung cancer. Daily fluctuations in PM_{2.5} concentration levels have also been related to hospital admissions for acute respiratory conditions in children, to school and kindergarten absences, to a decrease in respiratory lung volumes in normal children, and to increased medication use in children and adults with asthma. Recent studies show lung function growth in children is reduced with long term exposure to particulate matter. The elderly, people with pre-existing respiratory or cardiovascular disease, and children appear to be more susceptible to the effects of high levels of PM₁₀ and PM_{2.5}.</p>
<p>Volatile organic compounds (VOC)</p>	<p>VOCs are hydrocarbon compounds (any compound containing various combinations of hydrogen and carbon atoms) that exist in the ambient air. VOCs contribute to the formation of smog through atmospheric photochemical reactions and/or may be toxic. Compounds of carbon (also known as organic compounds) have different levels of reactivity; that is, they do not react at the same speed or do not form O₃ to the same extent when exposed to photochemical processes. VOCs often have an odor, and some examples include gasoline, alcohol, and the solvents used in paints. Exceptions to the VOC designation include CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate. VOCs are a criteria pollutant since they are a precursor to O₃, which is a criteria pollutant. The terms VOC and ROG (see below) interchangeably.</p>	<p>Organic chemicals are widely used as ingredients in household products. Paints, varnishes and wax all contain organic solvents, as do many cleaning, disinfecting, cosmetic, degreasing and hobby products. Fuels are made up of organic chemicals. All of these products can release organic compounds while you are using them, and, to some degree, when they are stored.</p>	<p>Breathing VOCs can irritate the eyes, nose and throat, can cause difficulty breathing and nausea, and can damage the central nervous system as well as other organs. Some VOCs can cause cancer. Not all VOCs have all these health effects, though many have several.</p>
<p>Reactive Organic Compounds (ROG)</p>	<p>Similar to VOC, ROGs are also precursors in forming O₃ and consist of compounds containing methane (CH₄), ethane, propane, butane, and longer chain hydrocarbons, which are typically the result of some type of combustion/decomposition process. Smog is formed when ROG and NO_x react in the presence of sunlight. ROGs are a criteria pollutant since they are a</p>	<p>Sources similar to VOCs.</p>	<p>Health effects similar to VOCs.</p>

Criteria Pollutant	Description	Sources	Health Effects
	precursor to O ₃ , which is a criteria pollutant. The terms ROG and VOC (see previous) interchangeably.		
Lead (Pb)	Pb is a heavy metal that is highly persistent in the environment and is considered a criteria pollutant. In the past, the primary source of Pb in the air was emissions from vehicles burning leaded gasoline. The major sources of Pb emissions are ore and metals processing, particularly Pb smelters, and piston-engine aircraft operating on leaded aviation gasoline. Other stationary sources include waste incinerators, utilities, and lead-acid battery manufacturers. It should be noted that the Program does not include operational activities such as metal processing or Pb acid battery manufacturing. As such, the Program is not anticipated to generate a quantifiable amount of Pb emissions.	Metal smelters, resource recovery, leaded gasoline, deterioration of Pb paint.	Fetuses, infants, and children are more sensitive than others to the adverse effects of Pb exposure. Exposure to low levels of Pb can adversely affect the development and function of the central nervous system, leading to learning disorders, distractibility, inability to follow simple commands, and lower intelligence quotient. In adults, increased Pb levels are associated with increased blood pressure. Pb poisoning can cause anemia, lethargy, seizures, and death; although it appears that there are no direct effects of Pb on the respiratory system. Pb can be stored in the bone from early age environmental exposure, and elevated blood Pb levels can occur due to breakdown of bone tissue during pregnancy, hyperthyroidism (increased secretion of hormones from the thyroid gland) and osteoporosis (breakdown of bony tissue). Fetuses and breast-fed babies can be exposed to higher levels of Pb because of previous environmental Pb exposure of their mothers.
Odor	Odor means the perception experienced by a person when one or more chemical substances in the air come into contact with the human olfactory nerves.	Odors can come from many sources including animals, human activities, industry, natures, and vehicles.	Offensive odors can potentially affect human health in several ways. First, odorant compounds can irritate the eye, nose, and throat, which can reduce respiratory volume. Second, studies have shown that the VOCs that cause odors can stimulate sensory nerves to cause neurochemical changes that might influence health, for instance, by compromising the immune system. Finally, unpleasant odors can trigger memories or attitudes linked to unpleasant odors, causing cognitive and emotional effects such as stress.

4.4.2.4 Existing Air Quality

Existing air quality is measured at established SCAQMD air quality monitoring stations. Monitored air quality is evaluated in the context of ambient air quality standards. These standards are the levels of air quality that are considered safe, with an adequate margin of safety, to protect the public health and welfare. NAAQS and CAAQS currently in effect are shown in **Table 4.4-2**.

The determination of whether a region's air quality is healthful or unhealthful is determined by comparing contaminant levels in ambient air samples to the State and Federal standards. At the time of this AQIA, the most recent State and Federal standards are presented in **Table 4.4-2**. The air quality in a region is considered to be in attainment if the measured ambient air pollutant levels for O₃, CO (except 8-hour Lake Tahoe), SO₂ (1 and 24 hour), NO₂, PM₁₀, and PM_{2.5} are not to be exceeded. All others are not to be equaled or exceeded. It should be noted that the three-year period is presented for informational purposes and is not the basis for how attainment status is determined. Attainment status for a pollutant means that the SCAB meets the standards set by the EPA or the California Environmental Protection Agency (CalEPA). Conversely, nonattainment means that an area has monitored air quality that does not meet the NAAQS or CAAQS. A State Implementation Plan (SIP) is required by the Federal Clean Air Act (CAA) for area that are designated non-attainment under the NAAQS. A SIP outlines the measures that a state what it will take to improve air quality in the area designated nonattainment. Once a nonattainment area meets the standards and additional redesignation requirements, the EPA designates the area as a maintenance area.

**Table 4.4-2
 AMBIENT AIR QUALITY STANDARDS**

Pollutant	Average Time	California Standards ¹		National Standards ²		
		Concentration ³	Method ⁴	Primary ^{3,5}	Secondary ^{3,6}	Method ⁷
Ozone (O ₃) ⁸	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	–	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m ³)		0.070 ppm (137 µg/m ³)		
Respirable Particulate Matter (PM ₁₀) ⁹	24 Hour	50 µg/m ³	Gravimetric or Beta Attenuation	150 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m ³		–		
Fine Particulate Matter (PM _{2.5}) ⁹	24 Hour	–	–	35 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m ³	Gravimetric or Beta Attenuation	12.0 µg/m ³	15.0 µg/m ³	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m ³)	–	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9 ppm (10 mg/m ³)		9 ppm (10 mg/m ³)	–	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m ³)		–	–	
Nitrogen Dioxide (NO ₂) ¹⁰	1 Hour	0.18 ppm (339 µg/m ³)	Gas Phase Chemiluminescence	100 ppb (188 µg/m ³)	–	Gas Phase Chemiluminescence

Source: CARB 5/4/16

Footnotes:

1 California standards for ozone, carbon monoxide (except Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, suspended particulate matter – PM₁₀, PM_{2.5}, and visibility reducing particles, are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2 National standards (other than ozone, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest eight-hour concentration in a year, averaged over three years, is equal to or less than the standard. For PM₁₀, the 24-hour standard is attained when the

- expected number of days per calendar year, with a 24-hour average concentration above $150 \mu\text{g}/\text{m}^3$, is equal to or less than one. For $\text{PM}_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over 3 years, are equal to or less than the standard. Contact the EPA for further clarification and current Federal policies.
- 3 Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
 - 4 Any equivalent procedure which can be shown to the satisfaction of the CARB to give equivalent results at or near the level of the air quality standard may be used.
 - 5 National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
 - 6 National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
 - 7 Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.
 - 8 On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
 - 9 On December 14, 2012, the national $\text{PM}_{2.5}$ primary standard was lowered from $15 \mu\text{g}/\text{m}^3$ to $12.0 \mu\text{g}/\text{m}^3$. The existing national 24-hour $\text{PM}_{2.5}$ standards (primarily and secondary) were retained at $35 \mu\text{g}/\text{m}^3$, as was the annual secondary standard of $15 \mu\text{g}/\text{m}^3$. The existing 24-hour PM_{10} standards (primarily and secondary) of $150 \mu\text{g}/\text{m}^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
 - 10 To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
 - 11 On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
 - 12 The CARB has identified lead and vinyl chloride as 'toxic air contaminants' (TAC) with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
 - 13 The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard ($1.5 \mu\text{g}/\text{m}^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
 - 14 In 1989, the CARB converted both the general statewide 10-mile visibility standard and Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

4.4.2.5 Regional Air Quality

Air pollution contributes to a wide variety of adverse health effects. The EPA has established NAAQS for six of the most common air pollutants: CO, Pb, O_3 , particulate matter (PM_{10} and $\text{PM}_{2.5}$), NO_2 , and SO_2 which are known as criteria pollutants. The SCAQMD monitors levels of various criteria pollutants at 37 permanent monitoring stations and 5 single-pollutant source Pb air monitoring sites throughout the air district. CARB adopted updates to the area designations for State ambient air quality standards at a public meeting on January 26, 2023. See **Table 4.4-3** for attainment designations for the SCAB. Appendix 2.1 of the AQIA provides geographic representation of the State and Federal attainment status for applicable criteria pollutants within the SCAB.

**Table 4.4-3
 ATTAINMENT STATUS OF CRITERIA POLLUTANTS IN THE SCAB**

Criteria Pollutant	State Designation	Federal Designation
O ₃ – 1-hour standard	Nonattainment	--
O ₃ – 8-hour standard	Nonattainment	Nonattainment
PM ₁₀	Nonattainment	Attainment
PM _{2.5}	Nonattainment	Nonattainment
CO	Attainment	Unclassifiable/Attainment
NO ₂	Attainment	Unclassifiable/Attainment
SO ₂	Attainment	Unclassifiable/Attainment
Pb ²⁷	Attainment	Unclassifiable/Attainment

Note: See Appendix 11, Volume 2 to this DPEIR for a detailed map of State/National Area Designations within the SCAB
 “-” = The national 1-hour O₃ standard was revoked effective June 15, 2005

4.4.2.6 Baseline Local Air Quality

To inform the air quality management district’s (AQMDs) residents about air quality conditions, the AQMD issues an air quality forecast each day and reports current air quality conditions for each numbered Monitoring Area and General Forecast Area depicted on the SCAQMD Map of Monitoring Areas (**Figure 4.4-1**).²⁸ As shown on **Figure 4.4-1**, the Program is located within Source Receptor Area 38. Within Source Receptor Area 38, the SCAQMD East San Bernardino Mountains monitoring station, located 0.28 mile north of the Program Area, is the nearest long-term air quality monitoring station for PM_{2.5}. As the East San Bernardino Mountains monitoring station does not provide data for O₃, CO, NO₂, or PM₁₀, the next nearest monitoring stations will be utilized. Data for O₃ and PM₁₀ was obtained from the Central San Bernardino Mountains monitoring station, located in Source Receptor Area 37, approximately 22.31 miles west of the Program Area. The nearest station for CO and NO₂ data was obtained from the Central San Bernardino Valley 2 monitoring station which is located approximately 24.18 miles southwest of the Program Area in Source Receptor Area 34. It should be noted that the Central San Bernardino Mountains and Central San Bernardino Valley 2 monitoring stations were utilized in lieu of the East San Bernardino Mountains monitoring station only in instances where data was not available.

The most recent three years of data available is shown on **Table 4.4-4** and is considered to be representative of the local air quality at the Program Area. Please note, data for SO₂ has been omitted as attainment is regularly met in the SCAB and few monitoring stations measure SO₂ concentrations.

²⁷ The Federal nonattainment designation for lead is only applicable towards the Los Angeles County portion of the SCAB.

²⁸ SCAQMD, 2023. SCAQMD Map of Monitoring Areas <http://www.aqmd.gov/docs/default-source/default-document-library/map-of-monitoring-areas.pdf> (accessed 11/16/23)

SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

21865 Copley Drive, Diamond Bar, CA 91765-4182

Internet: <http://www.aqmd.gov>

Air Quality Reporting

Since 1977, the South Coast Air Quality Management District has served as the local government agency responsible for measuring, reporting and taking steps to improve air quality.

To inform the AQMD's 15 million residents about air quality conditions, the AQMD issues an air quality forecast each day and reports current air quality conditions for each

numbered Monitoring Area and General Forecast Area depicted here.

This air quality information is transmitted to the public through newspapers, television, radio and pager services, through faxes to schools, through recorded messages on the AQMD's toll-free Smog Update telephone line, 1-800-CUT-SMOG, and on the AQMD's Internet Website <http://www.aqmd.gov>.

Newspapers, television and radio stations typically will report air

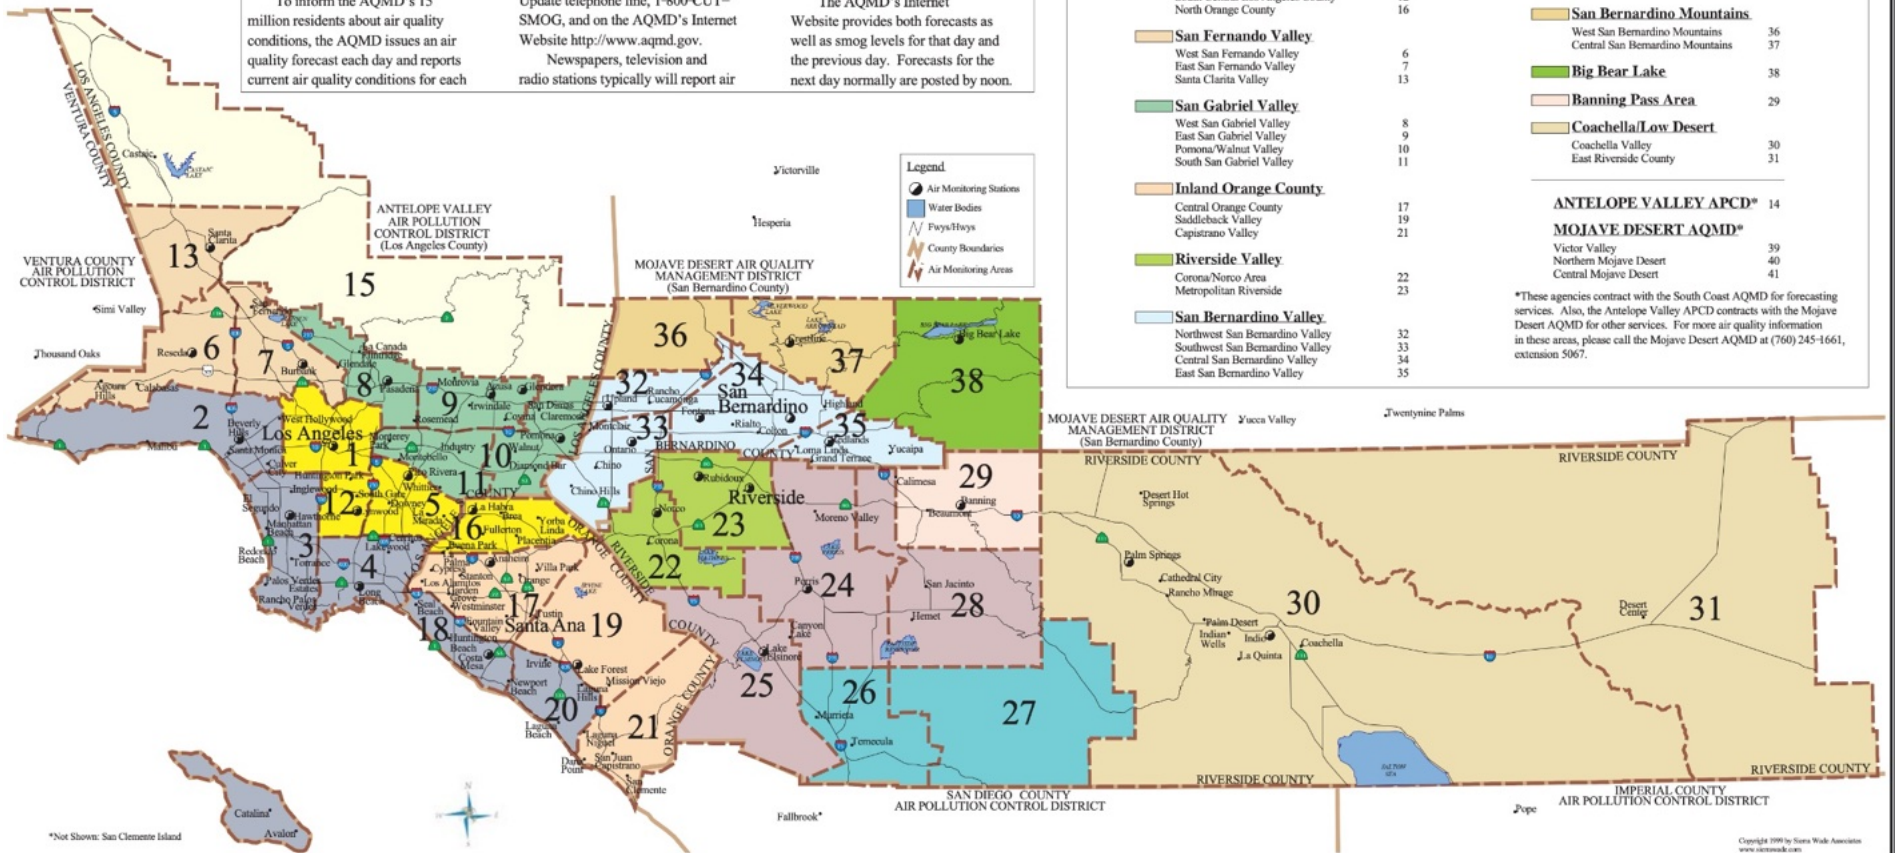

quality information using the General Forecast Areas, shown in color below, which are larger groupings of the more specific Air Monitoring Areas.

The 1-800-CUT-SMOG (1-800-288-7664) line also provides smog forecast and current smog level information by ZIP code.

The AQMD's Internet Website provides both forecasts as well as smog levels for that day and the previous day. Forecasts for the next day normally are posted by noon.

**Table 4.4-4
 PROGRAM AREA AIR QUALITY MONITORING SUMMARY – 2019-2021
 (DAYS STANDARDS WERE EXCEEDED AND MAXIMUM OBSERVED LEVELS)**

Pollutant/Standard	Standard	2019	2020	2021
Ozone				
Maximum Federal 1-Hour Concentration (ppm)		0.137	0.173	0.145
Maximum Federal 8-Hour Concentration (ppm)		0.117	0.136	0.119
Number of Days Exceeding State 1-Hour Standard	> 0.09 ppm	73	104	74
Number of Days Exceeding Federal/State 8-Hour Standard	> 0.070 ppm	109	141	118
Carbon Monoxide				
> 35 ppm	1.3	1.9	2.0	> 35 ppm
> 20 ppm	1.1	1.4	1.6	> 20 ppm
Nitrogen Dioxide				
Maximum Federal 1-Hour Concentration	> 0.100 ppm	0.059	0.054	0.056
Annual Federal Standard Design Value		0.014	0.015	0.015
Respirable Particulates (PM-10)				
Maximum Federal 24-Hour Concentration ($\mu\text{g}/\text{m}^3$)	> 150 $\mu\text{g}/\text{m}^3$	44	57	44
Annual Federal Arithmetic Mean ($\mu\text{g}/\text{m}^3$)		21.2	23.4	23.2
Number of Days Exceeding Federal 24-Hour Standard	> 150 $\mu\text{g}/\text{m}^3$	0	0	0
Number of Days Exceeding State 24-Hour Standard	> 50 $\mu\text{g}/\text{m}^3$	0	1	0
Fine Particulates (PM-2.5)¹				
Maximum Federal 24-Hour Concentration ($\mu\text{g}/\text{m}^3$)	> 35 $\mu\text{g}/\text{m}^3$	31.0	24.3	24.5
Annual Federal Arithmetic Mean ($\mu\text{g}/\text{m}^3$)	> 12 $\mu\text{g}/\text{m}^3$	5.94	7.62	7.04
Number of Days Exceeding Federal 24-Hour Standard	> 35 $\mu\text{g}/\text{m}^3$	0	0	0

ppm = Parts Per Million

Source: Data for O3, CO, NO2, PM10, and PM2.5 was obtained from SCAQMD Air Quality Data Tables.

4.4.3 **Regulatory Setting**

4.4.3.1 **Federal Regulations**

The EPA is responsible for setting and enforcing the NAAQS for O₃, CO, NO_x, SO₂, PM₁₀, and Pb. The EPA has jurisdiction over emissions sources that are under the authority of the Federal government including aircraft, locomotives, and emissions sources outside State waters (Outer Continental Shelf). The EPA also establishes emission standards for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission requirements of the CARB.

The CAA was first enacted in 1955 and has been amended numerous times in subsequent years (1963, 1965, 1967, 1970, 1977, and 1990). The CAA establishes the Federal air quality standards, the NAAQS, and specifies future dates for achieving compliance. The CAA also mandates that states submit and implement SIPs for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met.

The 1990 amendments to the CAA that identify specific emission reduction goals for areas not meeting the NAAQS require a demonstration of reasonable further progress toward attainment and

incorporate additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA most directly applicable to the development of the Program Area include in Title I (Non-Attainment Provisions) and Title II (Mobile Source Provisions). Title I provisions were established with the goal of attaining the NAAQS for the following criteria pollutants O₃, CO, NO_x, SO₂, PM₁₀, PM_{2.5}, and Pb. The NAAQS were amended in July 1997 to include an additional standard for O₃ and to adopt a NAAQS for PM_{2.5}. **Table 4.4-4** (previously presented) provides the NAAQS within the SCAB.

Mobile source emissions are regulated in accordance with Title II provisions. These provisions require the use of cleaner burning gasoline and other cleaner burning fuels such as methanol and natural gas. Automobile manufacturers are also required to reduce tailpipe emissions of hydrocarbons and NO_x. NO_x is a collective term that includes all forms of NO_x which are emitted as byproducts of the combustion process.

4.4.3.2 California Regulations

California Air Resources Board

CARB, which became part of the CalEPA in 1991, is responsible for ensuring implementation of the California Clean Air Act (AB 2595), responding to the CAA, and for regulating emissions from consumer products and motor vehicles. AB 2595 mandates achievement of the maximum degree of emissions reductions possible from vehicular and other mobile sources in order to attain the State ambient air quality standards by the earliest practical date. The CARB established the CAAQS for all pollutants for which the Federal government has NAAQS and, in addition, establishes standards for SO₄, visibility, hydrogen sulfide (H₂S), and vinyl chloride (C₂H₃Cl). However, at this time, H₂S and C₂H₃Cl are not measured at any monitoring stations in the SCAB because they are not considered to be a regional air quality problem. Generally, the CAAQS are more stringent than the NAAQS.

Local AQMDs, such as the SCAQMD, regulate air emissions from stationary sources such as commercial and industrial facilities. All air pollution control districts have been formally designated as attainment or non-attainment for each CAAQS.

Serious non-attainment areas are required to prepare AQMPs that include specified emission reduction strategies in an effort to meet clean air goals. These plans are required to include:

- Application of Best Available Retrofit Control Technology to existing sources;
- Developing control programs for area sources (e.g., architectural coatings and solvents) and indirect sources (e.g., motor vehicle use generated by residential and commercial development).
- A District permitting system designed to allow no net increase in emissions from any new or modified permitted sources of emissions.
- Implementing reasonably available transportation control measures and assuring a substantial reduction in growth rate of vehicle trips and miles traveled.
- Significant use of low emissions vehicles by fleet operators.
- Sufficient control strategies to achieve a 5% or more annual reduction in emissions or 15% or more in a period of three years for ROG_s, NO_x, CO and PM₁₀. However, air basins may use alternative emission reduction strategy that achieves a reduction of less than 5% per year under certain circumstances.

Title 24 Energy Efficiency Standards and California Green Building Standards (CalGreen)

California Code of Regulations Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. California Code of Regulations, Title 24, Part 11: California Green Building Standards Code (CALGreen Code) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

The CALGreen Code is updated on a regular basis, with the most recent approved update consisting of the 2022 CalGreen Code that became effective on January 1, 2023. The California Energy Code anticipates that the 2022 energy code will provide \$1.5 billion in consumer benefits and reduce GHG emissions by 10 million metric tons. The Program would be required to comply with the applicable standards in place at the time plan check submittals are made. These require, among other items:

Nonresidential Mandatory Measures

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, provide secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (5.106.4.1.2).
- Designated parking for clean air vehicles. In new projects or additions to alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- Electric Vehicle (EV) charging stations. New construction shall facilitate the future installation of EV supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of spaces to be provided for is contained in Table 5.106. 5.3.3 (5.106.5.3). Additionally, Table 5.106.5.4.1 specifies requirements for the installation of raceway conduit and panel power requirements for medium- and heavy-duty EV supply equipment for warehouses, grocery stores, and retail stores.
- Outdoor light pollution reduction. Outdoor lighting systems shall be designed to meet the backlight, uplight and glare ratings per Table 5.106.8 (5.106.8).
- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section 5.408.1.1, 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1).
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reuse or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
 - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1).

- Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor-mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
- Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gpm and 80 pounds per square inch (psi) (5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gpm at 80 psi (5.303.3.3.2).
- Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gpm at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gpm of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gpm (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).
- Outdoor potable water uses in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).
- Water meters. Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 square feet (sf) or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (gpd) (5.303.1.1 and 5.303.1.2).
- Outdoor water uses in rehabilitated landscape projects equal or greater than 2,500 sf. Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 sf requiring a building or landscape permit (5.304.3).
- Commissioning. For new buildings 10,000 sf and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

4.4.3.3 Regional and Local Regulations

2022 Air Quality Management Plan

Currently, the NAAQS and CAAQS are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMPs to meet the State and Federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

Under State law, the SCAQMD is required to prepare a plan for air quality improvement for pollutants for which the district is in non-compliance. Each iteration of the SCAQMD's AQMP is an update of the previous plan and has a 20-year horizon. The latest AQMP, the 2022 AQMP, was adopted by the SCAQMD Governing Board on December 2, 2022. The 2022 AQMP was developed to address the requirements for meeting the 2015 8-hour O₃ standard. The 2022 AQMP builds upon measures already in place from previous AQMPs. It also includes a variety of additional strategies such as regulation, accelerated deployment of available cleaner technologies (e.g., zero emissions technologies, when cost-effective and feasible, and low NO_x technologies in other applications), BMPs, co-benefits from existing programs (e.g., climate and energy efficiency), incentives, and other CAA measures to achieve the 2015 8-hour ozone standard. The 2022 AQMP incorporates the latest

scientific and technological information and planning assumptions, including the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) and updated emission inventory methodologies for various source categories. The 2022 AQMP requires CARB's adoption before submittal for the EPA's final approval, which is expected to occur sometime in 2023.

South Coast Air Quality Management District Rules and Regulations

To implement the AQMP, the SCAQMD develops and implements rules and regulations for emissions that may be generated by various uses and activities. The rules and regulations detail pollution-reduction measures that must be implemented during construction and operation of projects. Rules and regulations relevant to the Program include the following:

- Rule 203 (Permit to Operate): This rule requires that a permit to operate be obtained before operation or use any equipment that may cause the issuance of air contaminants. It would apply to portable generators used during construction.
- Rule 401 (Visible Emissions): This rule prohibits the discharge of visible air pollutant emissions from various sources as determined by shade and opacity criteria based on the Ringelmann Chart.
- Rule 402 (Nuisance): This rule prohibits the discharge of quantities of air contaminants or other material that causes injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety of any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property.
- Rule 403 (Fugitive Dust Control): This rule includes various requirements to prevent, reduce, and mitigate the amount of particulate matter entrained in the ambient air from man-made fugitive dust sources.
- Rule 1113 (Architectural Coatings): This rule establishes VOC content limits for a variety of architectural coatings, including 50 grams per liter for flat and non-flat coatings.

Background on Localized Significance Threshold Development

The analysis makes use of methodology included in the LST Methodology. The SCAQMD has established that impacts to air quality are significant if there is a potential to contribute or cause localized exceedances of NAAQS/CAAQS. Collectively, these are referred to as LSTs. The SCAQMD established LSTs in response to the SCAQMD Governing Board's Environmental Justice Initiative I-4²⁹. LSTs represent the maximum emissions from a Program that would not cause or contribute to an exceedance of the most stringent applicable Federal or State ambient air quality standard at the nearest residence or sensitive receptor. The SCAQMD states that lead agencies can use the LSTs as another indicator of significance in its air quality impact analyses.

LSTs were developed in response to environmental justice and health concerns raised by the public regarding exposure of individuals to criteria pollutants in local communities. To address the issue of localized significance, the SCAQMD adopted LSTs that show whether a project would cause or contribute to localized air quality impacts and thereby cause or contribute to potential localized adverse health effects. The analysis makes use of methodology included in the LST Methodology.

²⁹ The purpose of SCAQMD's Environmental Justice program is to ensure that everyone has the right to equal protection from air pollution and fair access to the decision-making process that works to improve the quality of air within their communities. Further, the SCAQMD defines Environmental Justice as "...equitable environmental policymaking and enforcement to protect the health of all residents, regardless of age, culture, ethnicity, gender, race, socioeconomic status, or geographic location, from the health effects of air pollution."

General Plans

Although local actions have important implications for air quality, regulation of air quality occurs primarily at the Federal, State, and regional levels. Local General Plans typically include several policies related to air quality that are directed at participating in regional collaboration with the applicable air district, achieving attainment of NAAQS and CAAQS, implementing the use of the applicable air district’s thresholds of significance for CEQA analysis, and ensuring project-level compliance with applicable air district rules.

4.4.4 Thresholds of Significance

The Program has been evaluated to determine if it will violate any air quality standards, contribute to an existing or projected air quality violation, or determine if it will result in a cumulatively considerable net increase of a criteria pollutant for which the SCAB is non-attainment under an applicable NAAQS and CAAQS. Additionally, the Program has been evaluated to determine consistency with the applicable AQMP, exposure of sensitive receptors to substantial pollutant concentrations, and the impacts of odors. The significance of these potential impacts is described in the following section.

The criteria used to determine the significance of potential Program-related air quality impacts are taken from the Initial Study Checklist in Appendix G of the State CEQA Guidelines (14 California Code of Regulations §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to air quality if it would:

- a) Conflict with or obstruct implementation of the applicable air quality plan.
- b) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
- c) Expose sensitive receptors to substantial pollutant concentrations.
- d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The SCAQMD has also developed regional significance thresholds for other regulated pollutants, as summarized at **Table 4.4-5**. The SCAQMD’s CEQA Air Quality Significance Thresholds (March 2023) indicate that any projects in the SCAB with daily emissions that exceed any of the indicated thresholds should be considered as having an individually and cumulatively significant air quality impact.

**Table 4.4-5
 MAXIMUM DAILY REGIONAL EMISSIONS THRESHOLDS**

Pollutant	Construction Regional Thresholds	Operational Regional Thresholds
NO _x	100 lbs/day	55 lbs/day
VOC	75 lbs/day	55 lbs/day
PM ₁₀	150 lbs/day	150 lbs/day
PM _{2.5}	55 lbs/day	55 lbs/day
SO _x	150 lbs/day	150 lbs/day
CO	550 lbs/day	550 lbs/day
Pb	3 lbs/day	3 lbs/day

lbs/day = Pounds Per Day

4.4.4.1 CalEEMod

Programs, such as that which is proposed by the Program, affect air quality through construction-source and operational-source emissions.

In May 2023 the California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including SCAQMD, released the latest version of California Emissions Estimator Model (CalEEMod) version 2022.1.1.12. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_x, SO_x, CO, PM₁₀, and PM_{2.5}) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from **MMs**. Accordingly, the latest version of CalEEMod has been used for this Program to determine construction and operational air quality emissions. Output from the model runs for both construction and operational activity are provided in Appendices 3.1 through 3.5 of the AQIA.

4.4.5 Potential Impacts

a) **Would the project conflict with or obstruct implementation of the applicable air quality plan?**

The Program Area is located within the SCAB, which is characterized by relatively poor air quality. The SCAQMD has jurisdiction over an approximately 10,743 square-mile area consisting of the four-county Basin and the Los Angeles County and Riverside County portions of what use to be referred to as the Southeast Desert Air Basin. In these areas, the SCAQMD is principally responsible for air pollution control, and works directly with the Southern California Association of Governments (SCAG), county transportation commissions, local governments, as well as State and Federal agencies to reduce emissions from stationary, mobile, and indirect sources to meet State and Federal ambient air quality standards.

Currently, these State and Federal air quality standards are exceeded in most parts of the SCAB. In response, the SCAQMD has adopted a series of AQMPs to meet the State and Federal ambient air quality standards. AQMPs are updated regularly in order to more effectively reduce emissions, accommodate growth, and to minimize any negative fiscal impacts of air pollution control on the economy.

In December 2022, the SCAQMD released the Final 2022 AQMP.³⁰ The 2022 AQMP continues to evaluate current integrated strategies and control measures to meet the CAAQS, as well as explore new and innovative methods to reach its goals. Some of these approaches include utilizing incentive programs, recognizing existing co-benefit programs from other sectors, and developing a strategy with fair-share reductions at the Federal, State, and local levels. Similar to the 2016 AQMP, the 2022 AQMP incorporates scientific and technological information and planning assumptions, including the 2020-2045 RTP/SCS, a planning document that supports the integration of land use and transportation to help the region meet the CAA requirements. The Program's consistency with the AQMP will be determined using the 2022 AQMP as discussed below.

Criteria for determining consistency with the AQMP are defined in Chapter 12, Section 12.2 and Section 12.3 of the SCAQMD's CEQA Air Quality Handbook (1993). These indicators are discussed below:

³⁰ SCAQMD, 2022. SCAQMD 2022 AQMP. <http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2022-air-quality-management-plan/final-2022-aqmp/final-2022-aqmp.pdf?sfvrsn=16> (accessed 09/01/23)

Consistency Criterion No. 1

The Program would not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP.

The violations that Consistency Criterion No. 1 refers to are the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if regional or localized significance thresholds were exceeded.

Construction Impacts – Consistency Criterion 1

The violations that Consistency Criterion No. 1 refers to are the CAAQS and NAAQS. CAAQS and NAAQS violations would occur if localized or regional significance thresholds were exceeded. The Program would not exceed the applicable localized significance thresholds (LSTs) or regional significance thresholds for construction activity after implementation of applicable **MMs**. A review of the consistency for each of the Program Components is provided below. Note that for air quality modeling purposes, as a conservative measure, and in order to identify the maximum daily emissions, the AQIA assumes that the Program would construct the following features simultaneously:

- Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project
 - 2 pump stations: 20 gpm and 1,520 gpm
 - 1,350 LF of brine pipeline
 - Total building area: 40,000 SF total on site
 - Installation of 2 MW of solar on existing BBARWA property
- Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project
 - 19,940 LF of pipeline (this is the maximum amount of pipeline that would be installed for any of the pipeline options, and as such, for modeling purposes, the maximum pipeline length that could be installed is utilized)
- Replenish Big Bear Component 3: Shay Pond Discharge Project
 - 6,310 LF of pipeline on unpaved area
- Replenish Big Bear Component 4: Solar Evaporation Pond
 - 57 acres of evaporation ponds
 - 2 monitoring wells
- Replenish Big Bear Component 5: Sand Canyon Recharge Project
 - 1 pump station
 - 2 monitoring wells
 - 7,210 LF of conveyance pipeline
 - Erosion control/rip rap at pipeline discharge

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWWPF to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes

- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8” to 10” from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA’s WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA’s Administration Building.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project**, 3,000 tons of concrete would be demolished. Additionally, up to 1,350 CY of asphalt export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project**, it was estimated that up to 8,000 CY of soil would be exported during construction of the new building.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-6
 CONSTRUCTION DURATION: COMPONENT 1**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 1: WWTP Upgrades	Jan 2025	Jan 2027	515

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-7**.

**Table 4.4-7
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 1**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project			
Dozers	Rubber Tired Dozers	1	8
Graders	Graders	1	8
Cranes	Cranes	1	8
Backhoes	Tractors/Loaders/Backhoes	1	8
Drill Rig	Bore/Drill Rig	1	8
Cement Trucks	Off-Highway Trucks	1	8
Forklifts	Forklifts	1	4
Backhoes	Tractors/Loaders/Backhoes	1	4
Front Loaders	Crawler Tractors	1	4
Dump/Delivery Trucks	Off-Highway Trucks	2	8

Construction Emissions Summary

Regional construction emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-8 and 4.4-9**.

**Table 4.4-8
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION: COMPONENT 1**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 1	3.82	27.47	44.30	0.08	7.30	2.95
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 1	4.63	30.88	56.16	0.16	13.44	3.82
Maximum Daily Emissions	4.63	30.88	56.16	0.16	13.44	3.82

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 miles per hour (mph) per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-9
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 1**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 1	2.06	11.73	52.47	0.08	6.65	2.36
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 1	2.61	25.00	68.39	0.16	13.44	3.38
Maximum Daily Emissions	2.61	25.00	68.39	0.16	13.44	3.38
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-9**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-10**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10** were calculated by interpolating the threshold values for the Program’s disturbed acreage.

**Table 4.4-10
 MAXIMUM DAILY LOCALIZED EMISSIONS THRESHOLDS**

Pollutant	Construction Localized Thresholds
All Program Components	
NO _x	170 lbs/day
CO	1,174 lbs/day
PM ₁₀	7 lbs/day
PM _{2.5}	5 lbs/day

Source: Localized Thresholds presented in this table are based on the SCAQMD Final Localized Significance Threshold Methodology, July 2008

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-11 and 4.4-12.**

**Table 4.4-11
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 1**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 1				
Maximum Daily Emissions	24.02	23.88	3.24	1.88
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-11 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 1. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs during Program Component 1, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-12
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 1**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 1				
Maximum Daily Emissions	8.28	32.04	3.24	1.29
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-12 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 1 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 1 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12” in diameter.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project**, it was estimated that up to 5,875 CY of asphalt/concrete export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project**, it was estimated that up to 19,940 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-13
 CONSTRUCTION DURATION: COMPONENT 2**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 2: Lake Pipeline	May 2025	Oct 2026	370

Construction Equipment

Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-14**.

**Table 4.4-14
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 2**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project			
Excavator	Excavator	1	8
Backhoe	Tractors/Loaders/Backhoes	1	8
Compaction Equipment	Plate Compactor	1	8
Pickup Trucks	Off-Highway Trucks	2	8
Paver	Paver	1	8
Roller	Roller	1	8

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Water Truck	Off-Highway Trucks	1	8
Traffic Control Signage and Devices	Signal Boards	1	8
Dump/Delivery Trucks	Off-Highway Trucks	10	8
Backhoe	Tractors/Loaders/Backhoes	1	6
Compactor	Plate Compactor	1	6
Roller/Vibrator	Roller	1	6
Pavement Cutter	Concrete/Industrial Saws	1	6
Grinder	Concrete/Industrial Saws	1	6
Haul Truck	Off-Highway Trucks	1	6
Dump Truck	Off-Highway Trucks	2	6
Water Truck	Off-Highway Trucks	1	4
Excavator	Excavator	1	4
Paving Machine	Pavers	1	2

It is assumed that the construction of analyzed features would use the equipment listed in **Table 4.4-14** simultaneously. Furthermore, the construction equipment provided in **Table 4.4-14** represents a “worst-case” (i.e. overestimation) of actual construction equipment that may likely be used during construction activities.

Construction Emissions Summary

Regional construction emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-15** and **4.4-16**.

**Table 4.4-15
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION: COMPONENT 2**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 2	1.41	28.15	27.16	0.15	9.00	2.52

Winter						
Replenish Big Bear Component 2	1.53	22.04	25.79	0.11	6.09	1.89
Maximum Daily Emissions	1.53	28.15	27.16	0.15	9.00	2.52
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-16
 OVERALL CONSTRUCTION EMISSIONS S SUMMARY – WITH MITIGATION: COMPONENT 2**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 2	1.09	26.07	30.75	0.15	8.93	2.46
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 2	1.05	19.20	31.16	0.11	5.99	1.80
Maximum Daily Emissions	1.09	26.07	31.16	0.15	8.93	2.46
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-16**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-17**.

**Table 4.4-17
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 2**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 2				
Maximum Daily Emissions	4.92	6.11	1.68	0.30
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-17 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 2. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions during Program Component 2, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-18
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 2**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 2				
Maximum Daily Emissions	2.84	9.69	1.88	0.33
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-18 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 2 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 2 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4” pipeline to reach Shay Pond from either an existing pipeline or a new 6” pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Construction Scenario

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 3: Shay Pond Discharge Project**, it was estimated that up to 7,020 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-19
 CONSTRUCTION DURATION: COMPONENT 3**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 3: Shay Pond	May 2025	Oct 2026	370

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-20**.

**Table 4.4-20
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 3**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 3: Shay Pond Discharge Project

Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-24 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 3 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 3 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 4: Shay Pond Conveyance Pipeline**, it was estimated that up to 710 CY of asphalt/concrete export would be needed.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-25
 CONSTRUCTION DURATION: COMPONENT 4**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 4: Evaporation Pond	May 2025	Oct 2026	370

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-26**.

**Table 4.4-26
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 4**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 4: Evaporation Pond			
Bulldozers	Rubber Tired Dozers	2	8
Front End Loaders	Crawler Tractors	2	8
Water Truck	Off-Highway Trucks	2	8
Scrapers	Scraper	7	8
Excavators	Excavator	2	8
Dump Trucks	Off-Highway Trucks	4	8

It is assumed that the construction of analyzed features would use the equipment listed in **Table 4.4-26** simultaneously. Furthermore, the construction equipment provided in **Table 4.4-26** represents a “worst-case” (i.e. overestimation) of actual construction equipment that may likely be used during construction activities.

Construction Emissions Summary

Regional construction emissions for this Replenish Big Bear Component are demonstrated in Tables 4.4-27 and 4.4-28.

**Table 4.4-27
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION: COMPONENT 4**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 4	25.23	77.74	92.44	0.20	7.07	2.41
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 4	25.22	77.94	91.34	0.20	7.07	2.41
Maximum Daily Emissions	25.23	77.94	92.44	0.20	7.07	2.41
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-28
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 4**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 4	19.05	15.43	123.73	0.20	7.82	3.08
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 4	19.05	15.62	122.63	0.20	7.82	3.08
Maximum Daily Emissions	19.05	15.62	123.73	0.20	7.82	3.08
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-28**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that

since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above, were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-29** and **4.4-30**.

**Table 4.4-29
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 4**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 4				
Maximum Daily Emissions	73.58	86.55	8.53	4.85
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	YES	NO

Impacts Without Mitigation

Table 4.4-29 identifies the localized impacts at the nearest receptor location in the vicinity of the Program. Without mitigation, localized construction emissions would exceed the applicable SCAQMD LSTs for emissions of PM₁₀ during Program Component 4. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA.

**Table 4.4-30
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 4**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 4				
Maximum Daily Emissions	11.26	117.83	6.04	2.58
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-30 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 4 site. The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. After implementation of **MM AQ-1**, construction-source emissions would not exceed the applicable SCAQMD LSTs thresholds and would be less-than-significant. Outputs from the model runs for mitigated localized construction-source emissions are provided in Appendix 3.6 through 3.10 of the AQIA. As shown in **Table 4.4-30**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would ensure that LST significance thresholds for construction are not exceeded. Impacts would be less than significant with the implementation of mitigation.

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

As part of the Program, the following will be constructed:

- A new 471 gpm pump station near the Resort Storage Pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 5: Sand Canyon**, it was estimated that up to 1,500 CY of concrete/asphalt export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 5: Sand Canyon**, it was estimated that up to 7,210 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-31
 CONSTRUCTION DURATION: COMPONENT 5**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 5: Sand Canyon	May 2025	Oct 2026	370

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-32**.

**Table 4.4-32
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 5**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 5: Sand Canyon

It is assumed that the construction of analyzed features would use the equipment listed in **Table 4.4-32** simultaneously. Furthermore, the construction equipment provided in **Table 4.4-32**

represents a “worst-case” (i.e. overestimation) of actual construction equipment that may likely be used during construction activities.

Construction Emissions Summary

Regional construction emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-33 and 4.4-34.**

**Table 4.4-33
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION: COMPONENT 5**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 5	1.73	24.18	28.67	0.11	7.46	2.16
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 5	2.37	24.67	36.02	0.10	6.16	2.03
Maximum Daily Emissions	2.37	24.67	36.02	0.11	7.46	2.16
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-34
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 5**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 5	1.41	22.09	32.26	0.11	7.39	2.10
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 5	1.75	20.35	42.30	0.10	6.00	1.89
Maximum Daily Emissions	1.75	22.09	42.30	0.11	7.39	2.10
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-34**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that

since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above, were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-35** and **4.4-36**.

**Table 4.4-35
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 5**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 5				
Maximum Daily Emissions	8.12	9.44	1.68	0.35
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-35 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 5. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions during Program Component 5, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-36
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 5**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 5				
Maximum Daily Emissions	6.04	13.03	1.68	0.30
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-36 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 5 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 5 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Program (Combined Impacts)

Construction Impacts

Regional construction emissions for the whole of the Program are demonstrated in **Tables 4.4-37** and **4.4-38**.

**Table 4.4-37
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION**

Year	Emissions (lbs/day)

Maximum Daily Emissions	25.32	91.08	284.06	0.63	35.21	10.88
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions with mitigation are summarized on **Table 4.4-38**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts. The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Therefore, the construction of the Program, and each individual project included therein, would not conflict with the AQMP according to this criterion. Impacts would be less than significant with the implementation of mitigation.

Operational Impacts – Consistency Criterion 1

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWPf to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. At this time, no new stationary or portable equipment, such as emergency generators, fire water pumps, or boilers, are anticipated to be required. However, as the design progresses, if a need for additional permits is identified, BBARWA will coordinate with SCAQMD to secure the required permits. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-39**, Replenish Big Bear Program Category 1 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 1 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-39
 PEAK OPERATIONAL EMISSIONS: CATEGORY 1**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	2.01	4.33	5.92	0.01	0.48	0.48
WINTER MAXIMUM	1.73	4.31	4.18	0.01	0.48	0.48
Total Maximum Daily Emissions	2.01	4.33	5.92	0.01	0.48	0.48
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12” in diameter.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. As this Program Category would include the conveyance of Program Water to Big Bear Lake via Stanfield Marsh, it is not anticipated that significant emissions would be generated, as the operation of the booster station that would convey the Program Water to Big Bear Lake via Stanfield Marsh falls under Program Category 1 operations as the booster station would be located at BBARWA’s WWTP site. As shown on **Table 4.4-40**, Replenish Big Bear Program Category 2 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 2 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-40
 PEAK OPERATIONAL EMISSIONS: CATEGORY 2**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
WINTER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
Total Maximum Daily Emissions	0.00	0.00	0.00	0.00	0.00	0.00
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4” pipeline to reach Shay Pond from either an existing pipeline or a new 6” pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. As this Program Category would include the conveyance of Program Water to Shay Pond, it is not anticipated that significant emissions would be generated, as the operation of the booster station that would convey the Program Water to Shay Pond falls under Program Category 1 operations as the booster station would be located at BBARWA’s WWTP site. As shown on **Table 4.4-41**, Replenish Big Bear Program Category 3 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 3 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-41
 PEAK OPERATIONAL EMISSIONS: CATEGORY 3**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
WINTER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
Total Maximum Daily Emissions	0.00	0.00	0.00	0.00	0.00	0.00
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic

maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. As this Program Category would include the operation of the brine evaporation ponds, it is not anticipated that significant emissions would be generated, as the brine is generated by the AWP operations that fall under Program Category 1. As shown on **Table 4.4-42**, Replenish Big Bear Program Category 4 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 4 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-42
 PEAK OPERATIONAL EMISSIONS: CATEGORY 4**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.38	0.00	0.00	0.00	0.00	0.00
WINTER MAXIMUM	0.38	0.00	0.00	0.00	0.00	0.00
Total Maximum Daily Emissions	0.38	0.00	0.00	0.00	0.00	0.00
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

As part of the Program, the following will be constructed:

- A new 471 gpm pump station near the Resort Storage Pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and

consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-43**, Replenish Big Bear Program Category 5 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 5 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-43

Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Operational Emissions

As previously stated, Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-44**, overall Program operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, the whole of the Program operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

Operational LST Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. However, the Program may include the use of an emergency diesel generators, allowing pump stations to run on backup power in case of emergency. If backup generator would be installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. Upon compliance with SCAQMD permitting procedures, localized emissions from any potential diesel generator would not result in substantial pollutant concentrations capable of exceeding operational LST thresholds. Therefore, the Program would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

As evaluated, the Program's localized and regional operation-source emissions would not exceed applicable regional significance threshold and LSTs. As such, a less than significant impact is expected.

On the basis of the preceding discussion, the Program would not conflict with the AQMP according to this criterion.

Consistency Criterion No. 2

The Program will not exceed the assumptions in the AQMP based on the years of Program build-out phase.

The 2022 AQMP demonstrates that the applicable ambient air quality standards can be achieved within the timeframes required under Federal law. Growth projections from local general plans adopted by counties in the district are provided to the SCAG, which develops regional growth forecasts, which are then used to develop future air quality forecasts for the AQMP. Development consistent with the growth projections of BBARWA, and partner agencies BBCCSD, BBLDWP, and BBMWD, is considered to be consistent with the AQMP, and therefore, would be consistent with the Consistency Criteria No. 2.

Construction Impacts – Consistency Criterion 2

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWWPF to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building.

Construction

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. The BBARWA WWTP Upgrades Project would be installed within BBARWA's existing WWTP, and there is land available to construct and upgrade the facility with comparable facilities to that which exists at present. Irrespective of the site's land use designation, which would not change

as a result of the proposed Program, development of the site to its maximum potential would likely occur, with disturbance of the entire site for each Program Component occurring during construction activities. As such, when considering that no emissions thresholds will be exceeded (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), a less than significant impact would result.

Operation

The proposed Program is unusual because its implementation will not directly contribute to growth within the Big Bear Valley. The proposed Program was identified in the Bear Valley Basin Groundwater Sustainability Plan (GSP) to accommodate anticipated growth in the Big Bear Valley based on projections in the area General Plans, and also projections in the Urban Water Management Plans for BBCCSD and BBMWD. If Sustainable Yield of the Bear Valley Basin declines over time, growth in the Big Bear Valley continues and water users have limited ability for further conservation, additional supply will likely be needed in the future to maintain supply reliability. The ~~drought proof new water~~ supply provided by the Program will become more critical to maintain water reliability in times of extended drought and ~~create more resilience provide insurance~~ against ~~climate change future~~ uncertainty. The Program will not induce growth directly since the additional number of employees is estimated to be five persons within an area currently populated with about 23,000 residents. Further, no indirect growth will be created because Program infrastructure will be used to meet the existing Big Bear Valley population demands for water.

Thus, since the Program's proposed land uses are consistent with BBARWA and partner agencies BBCCSD, BBLDWP, and BBMWD growth projections, and as the Program's construction and operational-source air pollutant emissions would not exceed the regional or LST emissions thresholds (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), this Program component is determined to be consistent with the second criterion. Thus, impacts would be less than significant.

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

Construction

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. The Stanfield Marsh/Big Bear Lake Discharge Project Options would be installed belowground, and therefore, the installation of this pipeline would not impact the function of the aboveground uses (roadways and dirt pathways). As such, when considering that no emissions thresholds will be exceeded (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), a less than significant impact would result.

Operation

As discussed above, the overall Program was identified in the Bear Valley Basin GSP to accommodate anticipated growth in the Big Bear Valley based on projections in the area General Plans, and also projections in the Urban Water Management Plans for BBCCSD and BBMWD. This Program Component will not induce growth directly since the no new employees would be necessary to operate this Program Component. Further, no indirect growth will be created because Program infrastructure will be used to meet the existing Big Bear Valley population demands for water. Thus, since the Program's proposed land uses are consistent with BBARWA and partner agencies BBCCSD, BBLDWP, and BBMWD growth

projections, and as this Program Component's construction and operational-source air pollutant emissions would not exceed the regional or LST emissions thresholds (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), this Program component is determined to be consistent with the second criterion. Thus, impacts would be less than significant.

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Construction

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. The Shay Pond Discharge Project would include installation of pipeline belowground, and therefore, the installation of this pipeline would not impact the function of the aboveground uses (roadways and dirt pathways). As such, when considering that no emissions thresholds will be exceeded (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), a less than significant impact would result.

Operation

As discussed above, the overall Program was identified in the Bear Valley Basin GSP to accommodate anticipated growth in the Big Bear Valley based on projections in the area General Plans, and also projections in the Urban Water Management Plans for BBCCSD and BBMWD. This Program Component will not induce growth directly since the no new employees would be necessary to operate this Program Component. Further, no indirect growth will be created because Program infrastructure will be used to meet the existing Big Bear Valley population demands for water. Thus, since the Program's proposed land uses are consistent with BBARWA and partner agencies BBCCSD, BBLDWP, and BBMWD growth projections, and as this Program Component's construction and operational-source air pollutant emissions would not exceed the regional or LST emissions thresholds (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), this Program component is determined to be consistent with the second criterion. Thus, impacts would be less than significant.

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Construction

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. The Solar Evaporation Ponds Project would be installed within BBARWA's existing WWTP site, and there is land available to construct the Solar Evaporation Ponds therein, which would be comparable facilities to that which exists at present in support of the existing WWTP. Irrespective of the site's land use designation, which would not change as a result of the proposed Program, development of the site to its maximum potential would likely occur, with disturbance of the entire site for each Program Component occurring during construction activities. As such, when

considering that no emissions thresholds will be exceeded (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), a less than significant impact would result.

Operation

As discussed above, the overall Program was identified in the Bear Valley Basin GSP to accommodate anticipated growth in the Big Bear Valley based on projections in the area General Plans, and also projections in the Urban Water Management Plans for BBCCSD and BBMWD. This Program Component will not induce growth directly since the no new employees would be necessary to operate this Program Component. Further, no indirect growth will be created because Program infrastructure will be used to meet the existing Big Bear Valley population demands for water. Thus, since the Program's proposed land uses are consistent with BBARWA and partner agencies BBCCSD, BBLDWP, and BBMWD growth projections, and as this Program Component's construction and operational-source air pollutant emissions would not exceed the regional or LST emissions thresholds (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), this Program component is determined to be consistent with the second criterion. Thus, impacts would be less than significant.

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

Construction

Peak day emissions generated by construction activities are largely independent of land use assignments, but rather are a function of development scope and maximum area of disturbance. The Sand Canyon Recharge Project would install a booster pump station within the Resort Storage Pond Site, two monitoring wells at unknown locations downstream of the Sand Canyon Recharge Area, and would install pipeline belowground, and a pipe outlet at the Sand Canyon Recharge Area channel. Regarding the Sand Canyon Booster Station, there is land available to construct the booster pump station therein, which would be comparable facilities to that which exists at present in support of the existing water infrastructure at the Resort Storage Pond Site. Irrespective of the site's land use designation, which would not change as a result of the proposed Program, development of the site to its maximum potential would likely occur, with disturbance of the entire site for each Program Component occurring during construction activities. The Sand Canyon Recharge Conveyance Pipeline would be installed belowground, and therefore, the installation of this pipeline would not impact the function of the aboveground uses (roadways and dirt pathways). The Sand Canyon Monitoring Wells would be installed within unknown locations, but in light of California Government Code Section 53091, infrastructure projects such as that which is proposed under the Program are land use and zoning independent, and therefore, irrespective of the site's land use designation, which would not change as a result of the proposed Program, development of the site to its maximum potential would likely occur, with disturbance of the entire site for each Program Component occurring during construction activities. As such, when considering that no emissions thresholds will be exceeded (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), a less than significant impact would result.

Operation

As discussed above, the overall Program was identified in the Bear Valley Basin GSP to accommodate anticipated growth in the Big Bear Valley based on projections in the area General Plans, and also projections in the Urban Water Management Plans for BBCCSD and BBMWD. This Program Component will not induce growth directly since the no new employees would be necessary to operate this Program Component. Further, no indirect growth will be created because Program infrastructure will be used to meet the existing Big Bear Valley population demands for water. Thus, since the Program's proposed land uses are consistent with BBARWA and partner agencies BBCCSD, BBLDWP, and BBMWD growth projections, and as this Program Component's construction and operational-source air pollutant emissions would not exceed the regional or LST emissions thresholds (refer to the emissions summaries provided under the discussion for **Consistency Criterion No. 1** above), this Program component is determined to be consistent with the second criterion. Thus, impacts would be less than significant.

On the basis of the preceding discussion, the Program is determined to be consistent with the second criterion.

Conclusion

The Program would not result in or cause NAAQS or CAAQS violations. The Program would be consistent with SCAQMD Consistency Criteria Nos. 1 and 2 for both construction and operation for each of the proposed Program components. Based on the preceding analysis, the Program is therefore considered to be consistent with the AQMP.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

*Mitigation Measures: **MM AQ-1** (see discussion below under question [b]) is required to minimize impacts under this issue.*

AQ-1: When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the EPA/CARB Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications.

Level of Significance After Mitigation: Less Than Significant.

Impacts would be less than significant with mitigation incorporated.

b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard?

CONSTRUCTION EMISSIONS

In other sections, the facilities proposed under the Program are described as Program Categories. In order to simplify the air quality modeling by area and facility component, the various Program facilities have been consolidated into components that are general to a specific location within the Program footprint. Note that for air quality modeling purposes, as a conservative measure, and in

order to identify the maximum daily emissions, the AQIA assumes that the Program would construct the following features simultaneously:

- Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project
 - 2 pump stations: 20 gpm and 1,520 gpm
 - 1,350 LF of brine pipeline
 - Total building area: 40,000 SF total on site
 - Installation of 2 MW of solar on existing BBARWA property
- Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project
 - 19,940 LF of pipeline (this is the maximum amount of pipeline that would be installed for any of the pipeline options, and as such, for modeling purposes, the maximum pipeline length that could be installed is utilized)
- Replenish Big Bear Component 3: Shay Pond Discharge Project
 - 6,310 LF of pipeline on unpaved area
- Replenish Big Bear Component 4: Solar Evaporation Pond
 - 57 acres of evaporation ponds
 - 2 monitoring wells
- Replenish Big Bear Component 5: Sand Canyon Recharge Project
 - 1 pump station
 - 2 monitoring wells
 - 7,210 LF of conveyance pipeline
 - Erosion control/rip rap at pipeline discharge

Below is an analysis of each Replenish Big Bear Program Component, as well as an impact analysis of the Program as a whole.

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWPf to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8” to 10” from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA’s WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA’s Administration Building.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project**, 3,000 tons of concrete would be demolished. Additionally, up to 1,350 CY of asphalt export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project**, it was estimated that up to 8,000 CY of soil would be exported during construction of the new building.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-6
CONSTRUCTION DURATION: COMPONENT 1**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 1: WWTP Upgrades	Jan 2025	Jan 2027	515

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-7**.

**Table 4.4-7
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 1**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project			
Dozers	Rubber Tired Dozers	1	8
Graders	Graders	1	8
Cranes	Cranes	1	8

Drill Rig	Bore/Drill Rig	1	8
Cement Trucks	Off-Highway Trucks	1	8
Forklifts	Forklifts	1	4
Backhoes	Tractors/Loaders/Backhoes	1	4
Front Loaders	Crawler Tractors	1	4
Dump/Delivery Trucks	Off-Highway Trucks	2	8

Construction Emissions Summary

Regional construction emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-8 and 4.4-9.**

**Table 4.4-8
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITHOUT MITIGATION: COMPONENT 1**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 1	3.82	27.47	44.30	0.08	7.30	2.95
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 1	4.63	30.88	56.16	0.16	13.44	3.82
Maximum Daily Emissions	4.63	30.88	56.16	0.16	13.44	3.82
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-9
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 1**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 1	2.06	11.73	52.47	0.08	6.65	2.36
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 1	2.61	25.00	68.39	0.16	13.44	3.38
Maximum Daily Emissions	2.61	25.00	68.39	0.16	13.44	3.38
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-9**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12” in diameter.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project,** it was estimated that up to 5,875 CY of asphalt/concrete export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project,** it was estimated that up to 19,940 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-13
CONSTRUCTION DURATION: COMPONENT 2**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 2: Lake Pipeline	May 2025	Oct 2026	370

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-14**.

**Table 4.4-14

SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-16
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 2**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 2	1.09	26.07	30.75	0.15	8.93	2.46
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 2	1.05	19.20	31.16	0.11	5.99	1.80
Maximum Daily Emissions	1.09	26.07	31.16	0.15	8.93	2.46
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-16**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must

meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4” pipeline to reach Shay Pond from either an existing pipeline or a new 6” pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Construction Scenario

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 3: Shay Pond Discharge Project**, it was estimated that up to 7,020 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-22**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of

MM AQ-1 by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 4: Shay Pond Conveyance Pipeline**, it was estimated that up to 710 CY of asphalt/concrete export would be needed.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

Replenish Big Bear Component 4	25.22	77.94	91.34	0.20	7.07	2.41
Maximum Daily Emissions	25.23	77.94	92.44	0.20	7.07	2.41
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to mandatory applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.

- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

Adherence to the above measures is mandatory per the established SCAQMD Rules and would contribute to further minimization of air quality emissions to be even further below SCAQMD significances thresholds on an individual project basis than would the Project without mitigation.

**Table 4.4-28
 OVERALL CONSTRUCTION EMISSIONS SUMMARY – WITH MITIGATION: COMPONENT 4**

Year	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Summer						
Replenish Big Bear Component 4	19.05	15.43	123.73	0.20	7.82	3.08
SCAQMD Regional Threshold	75	100	550	150	150	55
Winter						
Replenish Big Bear Component 4	19.05	15.62	122.63	0.20	7.82	3.08
Maximum Daily Emissions	19.05	15.62	123.73	0.20	7.82	3.08
SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded on an Individual Project Basis?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions for this Replenish Big Bear Component would be below significance thresholds without mitigation. However, when combined with the emissions that would be generated by the other Program Components, emissions would exceed the SCAQMD significance thresholds, and therefore could contribute to a significant air quality emissions impact. Thus, impacts with mitigation are summarized on **Table 4.4-28**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts from implementation of the Program as a whole as a result of the combined NO_x emissions threshold exceedance. In order to avoid this exceedance, the implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, below, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water

will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

As part of the Program, the following will be constructed:

- A new 471 gpm pump station near the Resort Storage Pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

Construction Scenario

Demolition

Per BBARWA and the Program Team, it is anticipated that the following tons of demolished material would be hauled off-site. The cubic yards (CY) of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 5: Sand Canyon**, it was estimated that up to 1,500 CY of concrete/asphalt export would be needed.

Grading Activities

Dust is typically a major concern during grading activities. Because such emissions are not amenable to collection and discharge through a controlled source, they are called “fugitive emissions”. Fugitive dust emissions rates vary as a function of many parameters (soil silt, soil moisture, wind speed, area disturbed, number of vehicles, depth of disturbance or excavation, etc.). The CalEEMod model was utilized to calculate fugitive dust emissions resulting from this phase of activity. The Program is anticipated to include soil import and export within the Program Area boundaries as a part of Program construction. Per BBARWA and Program Team provided data, it is anticipated that the following cubic yards of export would occur. The cubic yards of export will be analyzed using BBARWA and Program Team provided hauling trip lengths of 100 miles.

- **Replenish Big Bear Component 5: Sand Canyon**, it was estimated that up to 7,210 CY of soil would be exported.

Construction Worker Trips

Construction emissions for construction worker vehicles traveling to and from the Program Area, as well as vendor trips (construction materials delivered to each individual project site) were estimated based on information from CalEEMod model defaults, BBARWA and the Program Team. Additionally, it should be noted that the trip lengths were adjusted using BBARWA and Program Team provided hauling trip lengths of 100 miles.

Construction Duration

Construction duration utilized in the analysis represents a “worst-case” analysis scenario should construction occur any time after the respective dates since emission factors for construction decrease as the analysis year increases.

**Table 4.4-31
 CONSTRUCTION DURATION: COMPONENT 5**

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 5: Sand Canyon	May 2025	Oct 2026	370

Construction Equipment

Associated equipment was based on information provided by the Program Description. Please refer to specific detailed modeling inputs/outputs contained in Appendices 3.1 through 3.5 of the AQIA. A detailed summary of construction equipment is provided on **Table 4.4-32**.

**Table 4.4-32
 CONSTRUCTION EQUIPMENT ASSUMPTIONS: COMPONENT 5**

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 5: Sand Canyon			
Drill Rig	Bore/Drill Rig	1	8
Cranes	Cranes	1	4
Forklifts	Forklifts	1	4

SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	NO	YES	NO	NO	NO	NO

Impacts without Mitigation

Measures listed below (or equivalent language) shall appear on all Program grading plans, construction specifications and bid documents, and the implementing agencies shall ensure such language is incorporated prior to issuance of any development permits. The SCAQMD Rules that are currently applicable during construction activity for this Program include but are not limited to Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings). It should be noted that these Best Available Control Measures (BACMs) are not mitigation as they are standard regulatory requirements. As such, credit for Rule 403 and Rule 1113 have been taken.

The contractor must therefore adhere to applicable measures contained in Table 1 of Rule 403 including, but not limited to:

- All clearing, grading, earth-moving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.
- The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the Program are watered at least three (3) times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.
- The contractor shall ensure that traffic speeds on unpaved roads and project site areas are limited to 15 mph or less.

The estimated maximum daily construction emissions without mitigation are summarized on **Table 4.4-37**. Detailed unmitigated construction model outputs are presented in Appendices 3.1 through 3.5 of the AQIA. Under the assumed scenarios, emissions resulting from the Program construction would exceed criteria pollutant thresholds established by the SCAQMD for emissions of NO_x.

**Table 4.4-38

SCAQMD Regional Threshold	75	100	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Impacts with Mitigation

The estimated maximum daily construction emissions with mitigation are summarized on **Table 4.4-38**. Detailed mitigated construction model outputs are presented in Appendices 3.6 through 3.10 of the AQIA. **MM AQ-1** is recommended to reduce the severity of the impacts. The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-38**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. After implementation of **MM AQ-1**, Program construction-source emissions of NO_x would not exceed the applicable SCAQMD thresholds for any criteria pollutant. Thus, a less than significant impact would occur for Program-related construction-source emissions.

OPERATIONAL EMISSIONS

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWWPF to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection

- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8” to 10” from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA’s WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA’s Administration Building.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-39**, Replenish Big Bear Program Category 1 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 1 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-39
 PEAK OPERATIONAL EMISSIONS: CATEGORY 1**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	2.01	4.33	5.92	0.01	0.48	0.48
WINTER MAXIMUM	1.73	4.31	4.18	0.01	0.48	0.48
Total Maximum Daily Emissions	2.01	4.33	5.92	0.01	0.48	0.48
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12” in diameter.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. As this Program Category would include the conveyance of Program Water to Big Bear Lake via Stanfield Marsh, it is not anticipated that significant emissions would be generated, as the operation of the booster station that would convey the Program Water to Big Bear Lake via Stanfield Marsh falls under Program Category 1 operations as the booster station would be located at BBARWA’s WWTP site. As shown on **Table 4.4-40**, Replenish Big Bear Program Category 2 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 2 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-40
 PEAK OPERATIONAL EMISSIONS: CATEGORY 2**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
WINTER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
Total Maximum Daily Emissions	0.00	0.00	0.00	0.00	0.00	0.00
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4” pipeline to reach Shay Pond from either an existing pipeline or a new 6” pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy

consumption associated with the Program. As this Program Category would include the conveyance of Program Water to Shay Pond, it is not anticipated that significant emissions would be generated, as the operation of the booster station that would convey the Program Water to Shay Pond falls under Program Category 1 operations as the booster station would be located at BBARWA's WWTP site. As shown on **Table 4.4-41**, Replenish Big Bear Program Category 3 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 3 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-41
 PEAK OPERATIONAL EMISSIONS: CATEGORY 3**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
WINTER MAXIMUM	0.00	0.00	0.00	0.00	0.00	0.00
Total Maximum Daily Emissions	0.00	0.00	0.00	0.00	0.00	0.00
SCAQMD Regional Threshold	55	55	550	150	150	55
Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. As this Program Category would include the operation of the brine evaporation ponds, it is not anticipated that significant emissions would be generated, as the brine is generated by the AWP operations that fall under Program Category 1. As shown on **Table 4.4-42**, Replenish Big Bear Program Category 4 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear Program Category 4 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-42
 PEAK OPERATIONAL EMISSIONS: CATEGORY 4**

Source	Emissions (lbs/day)					
	VOC	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
SUMMER MAXIMUM	0.38	0.00	0.00	0.00	0.00	0.00

Threshold Exceeded?	NO	NO	NO	NO	NO	NO

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

As part of the Program, the following will be constructed:

- A new 471 gpm pump station near the Resort Storage Pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

Operational Emissions

Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-43**, Replenish Big Bear Program Category 5 operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, Replenish Big Bear

Program Category 5 operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

**Table 4.4-43

Operational Emissions

As previously stated, Long-term air quality impacts occur from mobile source emission generated from Program-related traffic and from stationary source emissions generated from natural gas. The Program primarily involves construction activity. For on-going operations, mobile emissions would be generated by the motor vehicles traveling to and from the project sites during on-going maintenance. However, the Program would generate a nominal number of traffic trips for periodic maintenance and inspections and would not result in any substantive new long-term emissions sources. Stationary area source emissions are typically generated by the consumption of natural gas for space and water heating devices and the use of consumer products. Heating and consumer products would not be used. Stationary energy emissions would result from energy consumption associated with the Program. However, the Program may include the use of an

emergency diesel generator, allowing the pump station to run on backup power in case of emergency. If a backup generator is installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. The Program would not result in a cumulatively considerable net increase of any criteria pollutant for which the Program region is non-attainment. Backup generators would be used only in emergency situations and for routine testing and maintenance purposes and would not contribute a substantial amount of emissions capable of exceeding SCAQMD thresholds. As shown on **Table 4.4-44**, overall Program operations would not exceed SCAQMD thresholds, the Program would not violate an air quality standard or contribute to an existing violation. Therefore, the whole of the Program operations would not result in a cumulatively considerable net increase of any criteria pollutant and impacts would be less than significant.

LV Site Discharge

BBARWA received a comment from the LVEDA during the NOP comment period noting that fugitive dust may become an issue at the LV Site during high wind events as a result in the modification of discharge operations resulting from the Program. A portion or all of the LV Site would become fallow as a result of the reduction or cessation of farming operations, and would continue to be maintained by BBARWA. At present, BBARWA and the farmer who leases the LV Site are responsible for maintaining the site, which includes handling migration of fugitive dust. Under the Program, BBARWA is considering enhancing site maintenance at the LV Site within areas that would become fallow from the reduction or cessation of farming operations at the Site. Enhanced site maintenance options are presently being explored by BBARWA, and include, but are not limited to, the following possible options:

- Weed abatement and dust control through use of dust control applications and eco-conscious weed killing applications;
- Planting cover crops, such as sorghum to prevent dust migration; and/or,
- Restoration and stabilization of the site utilizing salt bush and other native shrub species, which are self-sustaining with precipitation over the long term.

Both continued maintenance and enhanced site maintenance would ensure that dust migrating from the LV Site is minimized as all or a portion of the LV Site becomes fallow as a result of Program operations. However, given the concern raised by the LVEDA, in the event that continued maintenance and enhanced site maintenance do not fully address the potential for fugitive dust migration to occur at the site as a result of the change in discharge operations to the LV Site from implementation of the Program, a violation of Mojave Desert Air Quality Management District (MDAQMD) Rule 403.2, Fugitive Dust Control for the Mojave Desert Planning Area, could occur thereby resulting in a potentially significant air quality impact. Thus, a fugitive dust response program shall be implemented by BBARWA. **MM AQ-2** would ensure that implementation of this program occurs. This would ensure compliance with MDAQMD Rule 403.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

Mitigation Measures:

AQ-1: *When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the EPA/CARB Tier 4 emissions standards or equivalent and shall ensure that all*

construction equipment is tuned and maintained in accordance with the manufacturer's specifications.

AQ-2: ***BBARWA shall implement a fugitive dust response plan at the LV Site. This plan shall begin with signage at the LV Site (one along Camp Rock Road and one along Old Woman Springs Road [Highway 247]) notifying the public of a phone number and email address that can be reached if fugitive dust is observed migrating from the site. This same notification and information shall retain a place on BBARWA's website.***

In response to any notifications from the public that fugitive dust is observed migrating from the LV Site, BBARWA shall implement a plan of response to minimize fugitive dust. This plan can range from short-term in nature (i.e. utilization of chemical stabilization or water to spray on the surfaces from which dust originates at the LV Site) to long-term in nature (i.e. utilization of gravel or like natural materials to stabilize the LV Site surface over the long-term or planting native plants or cover crop to stabilize the soils). The end result of implementation of the fugitive dust response plan shall be to diminish visible dust at the LV Site.

Level of Significance After Mitigation: Less Than Significant.

The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-9**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would reduce maximum daily construction emissions of NO_x to below the SCAQMD regional significance threshold. Furthermore, operational emissions would be below significance thresholds as shown on **Table 4.4-10**, but in the event that continued maintenance and enhanced site maintenance do not fully address the potential for fugitive dust migration to occur at the LV Site as a result of the change in discharge operations to the LV Site from implementation of the Program, a fugitive dust response program shall be implemented by BBARWA through **MM AQ-2**, which would ensure that implementation of this program occurs and that operational fugitive dust is minimized. This would ensure compliance with MDAQMD's Rule 403. Therefore, with implementation of **MM AQ-1**, construction of Program facilities would not result in a cumulatively considerable net increase of a criteria pollutant for which the SCAB is non-attainment, and impacts would be less than significant.

c) Would the project expose sensitive receptors to substantial pollutant concentrations?

Applicability of LSTs for the Program

For this Program, the appropriate Source Receptor Area for the LST analysis is the SCAQMD East San Bernardino Mountains (Source Receptor Area 38). LSTs apply to CO, NO₂, PM₁₀, and PM_{2.5}. The SCAQMD produced look-up tables for projects less than or equal to 5 acres in size. In order to determine the appropriate methodology for determining localized impacts that could occur as a result of Program-related construction, the following process is undertaken:

- Identify the maximum daily on-site emissions that would occur during construction activity:
 - The maximum daily on-site emissions could be based on information provided by BBARWA and Program Team; or
 - The SCAQMD's Fact Sheet for Applying CalEEMod to Localized Significance Thresholds and CalEEMod User's Guide Appendix A: Calculation Details for CalEEMod can be used to determine the maximum site acreage that is actively disturbed based on the construction equipment fleet and equipment hours as estimated in CalEEMod.
- If the total acreage disturbed is less than or equal to 5 acres per day, then the SCAQMD's screening look-up tables are utilized to determine if a project has the potential to result in a

significant impact. The look-up tables establish a maximum daily emissions threshold in lbs/day that can be compared to CalEEMod outputs.

- If the total acreage disturbed is greater than 5 acres per day, then LST impacts may still be conservatively evaluated using the LST look-up tables for a 5-acre disturbance area. Use of the 5-acre disturbance area thresholds can be used to show that even if the daily emissions from all construction activity were emitted within a 5-acre area, and therefore concentrated over a smaller area which would result in greater site adjacent concentrations, the impacts would still be less than significant if the applicable 5-acre thresholds are utilized.
- The LST Methodology presents mass emission rates for each Source Receptor Area, project sizes of 1, 2, and 5 acres, and nearest receptor distances of 25, 50, 100, 200, and 500 meters. For project sizes between the values given, or with receptors at distances between the given receptors, the methodology uses linear interpolation to determine the thresholds.

Each Program Category has been broken out to analyze the impacts of each individual Program Component under the Program, which is appropriate in consideration of LSTs, as any impacts would be localized based on the nearby sensitive receptors.

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

This Program Category includes upgrades to the BBARWA WWTP, to construct a new 2.2 MGD AWWPF to produce up to 2,200 AFY of Program Water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the Solar Evaporation Ponds.

Additionally, the BBARWA WWTP upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump Program Water to Shay Pond and Stanfield Marsh.

This Program Category also accounts for the installation of installation of 2 MW of solar panels at BBARWA's WWTP, OAC, and Administration Building site, and the BBCCSD site to the south of BBARWA's Administration Building.

Localized Significance Thresholds for Construction

Emissions Considered

Based on SCAQMD's LST Methodology, emissions for concern during construction activities are on-site NO_x, CO, PM_{2.5}, and PM₁₀. The LST Methodology clearly states that "off-site mobile emissions from the Program should not be included in the emissions compared to LSTs." As such, for purposes of the construction LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered.

Maximum Daily Disturbed-Acreage

Based on information provided, it was assumed that two acres would be disturbed per day for all Program Categories. This is conservative as the construction impacts are assessed against a smaller acreage threshold which would represent a more conservative assessment.

Receptors

As previously stated, LSTs represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable NAAQS and CAAQS at the nearest residence or sensitive receptor. Receptor locations are off-site locations where individuals may be exposed to emissions from Program activities.

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, and individuals with pre-existing respiratory or cardiovascular illness. Structures that house these persons or places where they gather are defined as “sensitive receptors”. These structures typically include uses such as residences, hotels, and hospitals where an individual can remain for 24 hours. Consistent with the LST Methodology, the nearest land use where an individual could remain for 24 hours to a given project site has been used to determine construction and operational air quality impacts for emissions of PM₁₀ and PM_{2.5}, since PM₁₀ and PM_{2.5} thresholds are based on a 24-hour averaging time.

LSTs apply, even for non-sensitive land uses, consistent with LST Methodology and SCAQMD guidance. Per the LST Methodology, commercial and industrial facilities are not included in the definition of sensitive receptor because employees and patrons do not typically remain onsite for a full 24 hours but are typically onsite for eight hours or less. However, LST Methodology explicitly states that “LSTs based on shorter averaging periods, such as the NO₂ and CO LSTs, could also be applied to receptors such as industrial or commercial facilities since it is reasonable to assume that a worker at these sites could be present for periods of one to eight hours.” Therefore, any adjacent land use where an individual could remain for 1 or 8-hours, that is located at a closer distance to a project site than the receptor used for PM₁₀ and PM_{2.5} analysis, must be considered to determine construction and operational LST air impacts for emissions of NO₂ and CO since these pollutants have an averaging time of 1 and 8-hours.

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10** were calculated by interpolating the threshold values for the Program’s disturbed acreage.

**Table 4.4-10
 MAXIMUM DAILY LOCALIZED EMISSIONS THRESHOLDS**

Pollutant	Construction Localized Thresholds
All Program Components	
NO _x	170 lbs/day
CO	1,174 lbs/day
PM ₁₀	7 lbs/day
PM _{2.5}	5 lbs/day

Source: Localized Thresholds presented in this table are based on the SCAQMD Final Localized Significance Threshold Methodology, July 2008

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-11 and 4.4-12**.

**Table 4.4-11
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 1**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 1				
Maximum Daily Emissions	24.02	23.88	3.24	1.88
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-11 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 1. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs during Program Component 1, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-12
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 1**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 1				
Maximum Daily Emissions	8.28	32.04	3.24	1.29
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-12 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 1 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 1 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Operation-Source Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. However, this Program Component may include the use of an emergency diesel generators, allowing pump stations to run on backup power in case of emergency. If backup generator would be installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. Upon compliance with SCAQMD permitting procedures, localized emissions from any potential diesel generator would not result in substantial pollutant concentrations capable of exceeding operational LST thresholds. Therefore, this Program Component would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

CO “Hot Spot” Analysis

An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last twenty years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods³¹. This “hot spot” analysis did not predict any exceedance e of the 1-hour (20.0 ppm) or 8-hour (9.0 ppm) CO standards, as shown on **Table 4.4-45**.

**Table 4.4-45
 CO MODEL RESULTS**

Intersection Location	CO Concentrations (ppm)		
	Morning 1-hour	Afternoon 1-hour	8-hour
Wilshire Boulevard/Veteran Avenue	4.6	3.5	3.7
Sunset Boulevard/Highland Avenue	4	4.5	3.5
La Cienega Boulevard/Century Boulevard	3.7	3.1	5.2
Long Beach Boulevard/Imperial Highway	3	3.1	8.4

Source: 2003 AQMP, Appendix V: Modeling and Attainment Demonstrations

Notes: Federal 1-hour standard is 35 ppm and the deferral 8-hour standard is 9.0 ppm.

³¹ The CO “hot spot” analysis conducted in 2003 is the most current study used for CO “hot spot” analysis in the SCAB.

Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (1992 CO Plan), peak carbon monoxide concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. As evidence of this, for example, of the 8.4 ppm 8-hr CO concentration measured at the Long Beach Blvd. and Imperial Hwy. intersection (i.e., the highest CO generating intersection within the "hot spot" analysis), only 0.7 ppm was attributable to the traffic volumes and congestion at this intersection; the remaining 7.7 ppm were due to the ambient air measurements at the time the 2003 AQMP was prepared. In contrast, an adverse CO concentration, known as a "hot spot", would occur if an exceedance of the State one-hour standard of 20 parts per million (ppm) or the eight-hour standard of 9 ppm were to occur.

The ambient 1-hr and 8-hr CO concentration within the Program study area is estimated to be 2.0 ppm and 1.6 ppm, respectively (data from East San Bernardino Mountains monitoring station for 2021). Therefore, even if the traffic volumes for the Program were ten times the traffic volumes generated at the Long Beach Blvd. and Imperial Hwy. intersection, due to the on-going improvements in ambient air quality and vehicular emissions controls, this Program Component would not be capable of resulting in a CO "hot spot" at any study area intersections.

At buildout of the Program, the highest daily traffic volumes generated at the roadways within the vicinity of the Program are expected to generate less than the highest daily traffic volumes generated at the busiest intersection in the CO "hot spot" analysis. As such, this Program Component would not likely exceed the most stringent 1-hour CO standard; and therefore, the Program would not result in potentially adverse CO concentrations or "hot spots."

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

The Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

Localized Significance Thresholds for Construction

Emissions Considered

Based on SCAQMD's LST Methodology, emissions for concern during construction activities are on-site NO_x, CO, PM_{2.5}, and PM₁₀. The LST Methodology clearly states that "off-site mobile emissions from the Program should not be included in the emissions compared to LSTs." As such, for purposes of the construction LST analysis, only emissions included in the CalEEMod "on-site" emissions outputs were considered.

Maximum Daily Disturbed-Acreage

Based on information provided, it was assumed that two acres would be disturbed per day for all Program Categories. This is conservative as the construction impacts are assessed against a smaller acreage threshold which would represent a more conservative assessment.

Receptors

As previously stated, LSTs represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable NAAQS and CAAQS at the nearest residence or sensitive receptor. Receptor locations are off-site locations where individuals may be exposed to emissions from Program activities.

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, and individuals with pre-existing respiratory or cardiovascular illness. Structures that house these persons or places where they gather are defined as "sensitive receptors". These structures

typically include uses such as residences, hotels, and hospitals where an individual can remain for 24 hours. Consistent with the LST Methodology, the nearest land use where an individual could remain for 24 hours to a given project site has been used to determine construction and operational air quality impacts for emissions of PM₁₀ and PM_{2.5}, since PM₁₀ and PM_{2.5} thresholds are based on a 24-hour averaging time.

LSTs apply, even for non-sensitive land uses, consistent with LST Methodology and SCAQMD guidance. Per the LST Methodology, commercial and industrial facilities are not included in the definition of sensitive receptor because employees and patrons do not typically remain onsite for a full 24 hours but are typically onsite for eight hours or less. However, LST Methodology explicitly states that “LSTs based on shorter averaging periods, such as the NO₂ and CO LSTs, could also be applied to receptors such as industrial or commercial facilities since it is reasonable to assume that a worker at these sites could be present for periods of one to eight hours.” Therefore, any adjacent land use where an individual could remain for 1 or 8-hours, that is located at a closer distance to a project site than the receptor used for PM₁₀ and PM_{2.5} analysis, must be considered to determine construction and operational LST air impacts for emissions of NO₂ and CO since these pollutants have an averaging time of 1 and 8-hours.

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-17**.

**Table 4.4-17
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 2**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 2				
Maximum Daily Emissions	4.92	6.11	1.68	0.30
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-17 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 2. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions during Program Component 2, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-18
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 2**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 2				
Maximum Daily Emissions	2.84	9.69	1.88	0.33
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-18 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 2 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 2 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Operation-Source Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. This Program Component would not include the use of an emergency diesel generator. Therefore, this Program Component would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

CO “Hot Spot” Analysis

An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods³². This “hot spot” analysis did not predict any exceedance of the 1-hour (20.0 ppm) or 8-hour (9.0 ppm) CO standards, as shown on **Table 4.4-45, above**.

The ambient 1-hr and 8-hr CO concentration within the Program study area is estimated to be 2.0 ppm and 1.6 ppm, respectively (data from East San Bernardino Mountains monitoring station for 2021). Therefore, even if the traffic volumes for the Program were ten times the traffic volumes

³² The CO “hot spot” analysis conducted in 2003 is the most current study used for CO “hot spot” analysis in the SCAB.

generated at the Long Beach Blvd. and Imperial Hwy. intersection, due to the on-going improvements in ambient air quality and vehicular emissions controls, this Program Component would not be capable of resulting in a CO “hot spot” at any study area intersections.

At buildout of the Program, the highest daily traffic volumes generated at the roadways within the vicinity of the Program are expected to generate less than the highest daily traffic volumes generated at the busiest intersection in the CO “hot spot” analysis. As such, this Program Component would not likely exceed the most stringent 1-hour CO standard; and therefore, the Program would not result in potentially adverse CO concentrations or “hot spots.”

Replenish Big Bear Component 3: Shay Pond Discharge Project

The Program would ultimately install about 710 LF of 4” pipeline to reach Shay Pond from either an existing pipeline or a new 6” pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Localized Significance Thresholds for Construction

Emissions Considered

Based on SCAQMD’s LST Methodology, emissions for concern during construction activities are on-site NO_x, CO, PM_{2.5}, and PM₁₀. The LST Methodology clearly states that “off-site mobile emissions from the Program should not be included in the emissions compared to LSTs.” As such, for purposes of the construction LST analysis, only emissions included in the CalEEMod “on-site” emissions outputs were considered.

Maximum Daily Disturbed-Acreage

Based on information provided, it was assumed that two acres would be disturbed per day for all Program Categories. This is conservative as the construction impacts are assessed against a smaller acreage threshold which would represent a more conservative assessment.

Receptors

As previously stated, LSTs represent the maximum emissions from a project that would not cause or contribute to an exceedance of the most stringent applicable NAAQS and CAAQS at the nearest residence or sensitive receptor. Receptor locations are off-site locations where individuals may be exposed to emissions from Program activities.

Some people are especially sensitive to air pollution and are given special consideration when evaluating air quality impacts from projects. These groups of people include children, the elderly, and individuals with pre-existing respiratory or cardiovascular illness. Structures that house these persons or places where they gather are defined as “sensitive receptors”. These structures typically include uses such as residences, hotels, and hospitals where an individual can remain for 24 hours. Consistent with the LST Methodology, the nearest land use where an individual could remain for 24 hours to a given project site has been used to determine construction and operational air quality impacts for emissions of PM₁₀ and PM_{2.5}, since PM₁₀ and PM_{2.5} thresholds are based on a 24-hour averaging time.

LSTs apply, even for non-sensitive land uses, consistent with LST Methodology and SCAQMD guidance. Per the LST Methodology, commercial and industrial facilities are not included in the definition of sensitive receptor because employees and patrons do not typically remain onsite for a full 24 hours but are typically onsite for eight hours or less. However, LST Methodology explicitly states that “LSTs based on shorter averaging periods, such as the NO₂ and CO LSTs, could also be applied to receptors such as industrial or commercial facilities since it is reasonable to assume that a worker at these sites could be present for periods of one to eight hours.” Therefore, any

adjacent land use where an individual could remain for 1 or 8-hours, that is located at a closer distance to a project site than the receptor used for PM₁₀ and PM_{2.5} analysis, must be considered to determine construction and operational LST air impacts for emissions of NO₂ and CO since these pollutants have an averaging time of 1 and 8-hours.

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above, were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-23** and **4.4-24**.

**Table 4.4-23
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 3**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 3				
Maximum Daily Emissions	5.81	7.09	0.22	0.20
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-23 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 3. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions during Program Component 3, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-24
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 3**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 3				
Maximum Daily Emissions	3.73	10.68	0.14	0.13
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-24 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 3 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 3 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Operation-Source Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. This Program Component would not include the use of an emergency diesel generator. Therefore, this Program Component would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

CO “Hot Spot” Analysis

An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods³³. This “hot spot” analysis did not predict any exceedance of the 1-hour (20.0 ppm) or 8-hour (9.0 ppm) CO standards, as shown on **Table 4.4-45, above**.

The ambient 1-hr and 8-hr CO concentration within the Program study area is estimated to be 2.0 ppm and 1.6 ppm, respectively (data from East San Bernardino Mountains monitoring station for 2021). Therefore, even if the traffic volumes for the Program were ten times the traffic volumes generated at the Long Beach Blvd. and Imperial Hwy. intersection, due to the on-going improvements in ambient air quality and vehicular emissions controls, this Program Component would not be capable of resulting in a CO “hot spot” at any study area intersections.

At buildout of the Program, the highest daily traffic volumes generated at the roadways within the vicinity of the Program are expected to generate less than the highest daily traffic volumes generated at the busiest intersection in the CO “hot spot” analysis. As such, this Program Component would not likely exceed the most stringent 1-hour CO standard; and therefore, the

³³ The CO “hot spot” analysis conducted in 2003 is the most current study used for CO “hot spot” analysis in the SCAB.

Program would not result in potentially adverse CO concentrations or “hot spots.” CO Impacts would be less than significant.

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

The Program would include between 23 and 57 acres of Solar Evaporation Ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to two monitoring wells.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above, were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-29** and **4.4-30**.

**Table 4.4-29
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 4**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 4				
Maximum Daily Emissions	73.58	86.55	8.53	4.85
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	YES	NO

Impacts Without Mitigation

Table 4.4-29 identifies the localized impacts at the nearest receptor location in the vicinity of the Program. Without mitigation, localized construction emissions would exceed the applicable SCAQMD LSTs for emissions of PM₁₀ during Program Component 4. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA.

**Table 4.4-30
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 4**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 4				
Maximum Daily Emissions	11.26	117.83	6.04	2.58
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-30 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 4 site. The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. After implementation of **MM AQ-1**, construction-source emissions would not exceed the applicable SCAQMD LSTs thresholds and would be less-than-significant. Outputs from the model runs for mitigated localized construction-source emissions are provided in Appendix 3.6 through 3.10 of the AQIA. As shown in **Table 4.4-30**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would ensure that LST significance thresholds for construction are not exceeded. Thus, impacts would be less than significant with the implementation of mitigation.

Localized Operation-Source Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. However, this Program Component would not include the use of an emergency diesel generators, allowing pump stations to run on backup power in case of emergency. Therefore, this Program Component would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

CO “Hot Spot” Analysis

An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods³⁴. This “hot spot” analysis did not predict any exceedance e of the 1-hour (20.0 ppm) or 8-hour (9.0 ppm) CO standards, as shown on **Table 4.4-45, above**.

The ambient 1-hr and 8-hr CO concentration within the Program study area is estimated to be 2.0 ppm and 1.6 ppm, respectively (data from East San Bernardino Mountains monitoring station for 2021). Therefore, even if the traffic volumes for the Program were ten times the traffic volumes

³⁴ The CO “hot spot” analysis conducted in 2003 is the most current study used for CO “hot spot” analysis in the SCAB.

generated at the Long Beach Blvd. and Imperial Hwy. intersection, due to the on-going improvements in ambient air quality and vehicular emissions controls, this Program Component would not be capable of resulting in a CO “hot spot” at any study area intersections.

At buildout of the Program, the highest daily traffic volumes generated at the roadways within the vicinity of the Program are expected to generate less than the highest daily traffic volumes generated at the busiest intersection in the CO “hot spot” analysis. As such, this Program Component would not likely exceed the most stringent 1-hour CO standard; and therefore, the Program would not result in potentially adverse CO concentrations or “hot spots.” CO Impacts would be less than significant.

Replenish Big Bear Component 5: Sand Canyon Recharge Project

The Sand Canyon Recharge Project involves extracting Program Water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by the Resort. The Program Water will then be pumped and conveyed to the Sand Canyon Recharge Area using a new pump station and pipeline.

As part of the Program, the following will be constructed:

- A new 471 gpm pump station near the Resort Storage Pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

Localized Significance Thresholds for Construction

Program-related Receptors

The SCAQMD recommends that the nearest sensitive receptor be considered when determining the Program’s potential to cause an individual and cumulatively significant impact. As a conservative measure it is assumed that the nearest sensitive receptor could potentially be located immediately adjacent to construction activities. It should be noted that the LST Methodology also explicitly states that “It is possible that a project may have receptors closer than 25 meters. Projects with boundaries located closer than 25 meters to the nearest receptor should use the LSTs for receptors located at 25 meters.” Consistent with the SCAQMD’s LST Methodology, a 25-meter receptor distance is utilized in this analysis and provide for a conservative i.e. “health protective” standard of care.

Localized Thresholds for Construction Activity

Since the total acreage disturbed is less than five acres per day for construction activities, the SCAQMD’s screening look-up tables are utilized in determining impacts. It should be noted that since the look-up tables identifies thresholds at only 1 acre, 2 acres, and 5 acres, linear regression has been utilized to determine localized significance thresholds. Consistent with SCAQMD guidance, the thresholds presented in **Table 4.4-10**, above, were calculated by interpolating the threshold values for the Program’s disturbed acreage.

LST Construction Emissions Summary

Localized emissions for this Replenish Big Bear Component are demonstrated in **Tables 4.4-35** and **4.4-36**.

**Table 4.4-35
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITHOUT MITIGATION: COMPONENT 5**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 5				
Maximum Daily Emissions	8.12	9.44	1.68	0.35
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts Without Mitigation

Table 4.4-35 identifies the localized impacts at the nearest receptor location in the vicinity of the Replenish Big Bear Component 5. Without mitigation, localized construction emissions would not exceed the applicable SCAQMD LSTs for emissions during Program Component 5, and as a result would not result in a potentially significant air quality impact. Outputs from the model runs for construction LSTs are provided in Appendix 3.1 through 3.5 of the AQIA. Impacts would be less than significant.

**Table 4.4-36
 LOCALIZED SIGNIFICANCE SUMMARY OF CONSTRUCTION – WITH MITIGATION: COMPONENT 5**

On-Site Construction Emissions	Emissions (lbs/day)			
	NO _x	CO	PM ₁₀	PM _{2.5}
Replenish Big Bear Component 5				
Maximum Daily Emissions	6.04	13.03	1.68	0.30
SCAQMD Localized Threshold	170	1,174	7	5
Threshold Exceeded?	NO	NO	NO	NO

Impacts with Mitigation

Table 4.4-36 identifies mitigated localized impacts at the receptors nearest the Replenish Big Bear Component 5 site. The estimated localized impacts at the receptors nearest the Replenish Big Bear Component 5 site would be below significance thresholds without mitigation. Thus, a less than significant impact would occur for Program-related construction-source emissions.

Localized Operation-Source Emissions

According to SCAQMD LST Methodology, LSTs would apply to the operational phase of a proposed project if the project includes stationary sources or attracts mobile sources that may spend extended periods queuing and idling at the site (e.g., warehouse or transfer facilities). As previously discussed, the Program would generate a nominal number of traffic trips in the context of on-going maintenance resulting in a negligible amount of new mobile source emissions. Additionally, all pumps associated with the Program are assumed to be electrically powered and would not directly generate air emissions. However, this Program Component may include the use of an emergency diesel generators, allowing pump stations to run on backup power in case of emergency. If backup generator would be installed, the Lead Agency would be required to obtain the applicable permits from SCAQMD for operation of such equipment. The SCAQMD is responsible for issuing permits for the operation of stationary sources in order to reduce air pollution, and to attain and maintain NAAQS and CAAQS in the SCAB. Upon compliance with SCAQMD permitting procedures, localized emissions from any potential diesel generator would not result in substantial pollutant concentrations capable of exceeding operational LST

thresholds. Therefore, this Program Component would not expose sensitive receptors to substantial pollutant concentrations and impacts would be less than significant.

CO “Hot Spot” Analysis

An adverse CO concentration, known as a “hot spot”, would occur if an exceedance of the State one-hour standard of 20 ppm or the eight-hour standard of 9 ppm were to occur.

To establish a more accurate record of baseline CO concentrations affecting the SCAB, a CO “hot spot” analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods³⁵. This “hot spot” analysis did not predict any exceedance of the 1-hour (20.0 ppm) or 8-hour (9.0 ppm) CO standards, as shown on **Table 4.4-45, above**.

The ambient 1-hr and 8-hr CO concentration within the Program study area is estimated to be 2.0 ppm and 1.6 ppm, respectively (data from East San Bernardino Mountains monitoring station for 2021). Therefore, even if the traffic volumes for the Program were ten times the traffic volumes generated at the Long Beach Blvd. and Imperial Hwy. intersection, due to the on-going improvements in ambient air quality and vehicular emissions controls, this Program Component would not be capable of resulting in a CO “hot spot” at any study area intersections.

At buildout of the Program, the highest daily traffic volumes generated at the roadways within the vicinity of the Program are expected to generate less than the highest daily traffic volumes generated at the busiest intersection in the CO “hot spot” analysis. As such, this Program Component would not likely exceed the most stringent 1-hour CO standard; and therefore, the Program would not result in potentially adverse CO concentrations or “hot spots.” CO Impacts would be less than significant.

Potential Impacts to Sensitive Receptors from the Whole of the Program

The potential impact of Program-generated air pollutant emissions at sensitive receptors has been considered. Sensitive receptors can include uses such as long-term health care facilities, rehabilitation centers, and retirement homes. Residences, schools, playgrounds, childcare centers, and athletic facilities can also be considered as sensitive receptors. Results of the LST analysis indicate that, the Program would not exceed the SCAQMD LSTs during construction, but for one Program Component (Program Component 4, Solar Evaporation Ponds), which requires implementation of **MM AQ-1**, which would require the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. Therefore, through the implementation of mitigation, sensitive receptors would not be exposed to substantial pollutant concentrations during Program construction. Upon compliance with SCAQMD permitting procedures, localized emissions from any potential diesel generator would not result in substantial pollutant concentrations capable of exceeding operational LST thresholds. Further Program traffic would not create or result in a CO “hotspot.” Therefore, sensitive receptors would not be exposed to substantial pollutant concentrations as the result of Program construction or operations. Impacts would be less than significant through the implementation of **MM AQ-1**.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

³⁵ The CO “hot spot” analysis conducted in 2003 is the most current study used for CO “hot spot” analysis in the SCAB.

*Mitigation Measures: Implementation of **MM AQ-1** is required to minimize impacts under this issue.*

AQ-1: *When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the EPA/CARB Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications.*

Level of Significance After Mitigation: Less Than Significant.

The implementing agencies must meet the performance standard of **MM AQ-1** by requiring the contractor(s) to utilize Tier 4 emissions standards construction equipment for equipment greater than 150 horsepower (>150 hp), with the exception of drill rigs. As shown in **Table 4.4-11**, implementation of this scenario to achieve the performance standard of **MM AQ-1** would ensure that LSTs for construction are not exceeded. Therefore, with implementation of **MM AQ-1**, construction of Program facilities would not expose sensitive receptors to substantial pollutant concentrations, and impacts for both construction and operation of the Program would be less than significant.

d) Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Replenish Big Bear Component 1: BBARWA WWTP Upgrades Project

Construction

SCAQMD Rule 402 Nuisance, prohibits discharge from any source whatsoever of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety or any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This rule covers generation of odors. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Under the right meteorological conditions, some odors may still be offensive several miles from the source.³⁶

Implementation of this Program Component would have the potential to generate odorous emissions during construction activities. Construction activities are not typically sources of nuisance odors, although construction could result in minor amounts of odorous emissions associated with diesel exhaust or evaporation of VOCs from architectural coatings. These smells are largely due to the presence of sulfur and the creation of hydrocarbons during combustion. As shown in **Table 4.4-9**, above under question (b), construction would not result in significant emissions of SO_x. Furthermore, construction would be temporary, and equipment would not be located in a single location throughout the duration of construction. Odorous hydrocarbons tend to dissipate quickly and would only affect receptors in the immediate vicinity, rather than a substantial number of people at any given time. Therefore, construction activities would not result in other emissions, such as odors, adversely affecting a substantial number of people, and impacts would be less than significant.

Operation

Operation of this Program Component would not result in odor impacts because none of these components include odor-generating components. The BBARWA's WWTP, the proposed

³⁶ CARB. 2005. Air Quality and Land Use Handbook: A Community Health Perspective. <https://www.arb.ca.gov/ch/handbook.pdf> (accessed 08/28/23)

location of the AWPf, already treats and stores wastewater and recycled water, and BBARWA implements odor control measures to prevent odorous emissions. Source water from the existing wastewater treatment process at BBARWA would be secondary effluent suitable for reuse, and product water from the AWPf would be advance treated recycled water suitable for discharge to Big Bear Lake. Neither of these types of treated water has an associated odor. Furthermore, the AWPf system is enclosed, and therefore would not be a source of new odor at the BBARWA WWTP site. Thus, odor emissions impacts would be less than significant.

Replenish Big Bear Component 2: Stanfield Marsh/Big Bear Lake Discharge Project

Construction

SCAQMD Rule 402 Nuisance, prohibits discharge from any source whatsoever of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety or any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This rule covers generation of odors. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Under the right meteorological conditions, some odors may still be offensive several miles from the source.

Implementation of this Program Component would have the potential to generate odorous emissions during construction activities. Construction activities are not typically sources of nuisance odors, although construction could result in minor amounts of odorous emissions associated with diesel exhaust or evaporation of VOCs from architectural coatings. These smells are largely due to the presence of sulfur and the creation of hydrocarbons during combustion. As shown in **Table 4.4-16**, above under question (b), construction would not result in significant emissions of SO_x. Furthermore, construction would be temporary, and equipment would not be located in a single location throughout the duration of construction. Odorous hydrocarbons tend to dissipate quickly and would only affect receptors in the immediate vicinity, rather than a substantial number of people at any given time. Therefore, construction activities would not result in other emissions, such as odors, adversely affecting a substantial number of people, and impacts would be less than significant.

Operation

Operation of this Program Component would not result in odor impacts because none of these components include odor-generating components. Pipelines are located belowground, and are enclosed. Thus, no odor emissions would occur. Impacts would be less than significant.

Replenish Big Bear Component 3: Shay Pond Discharge Project

Construction

SCAQMD Rule 402 Nuisance, prohibits discharge from any source whatsoever of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety or any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This rule covers generation of odors. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Under the right meteorological conditions, some odors may still be offensive several miles from the source.

Implementation of this Program Component would have the potential to generate odorous emissions during construction activities. Construction activities are not typically sources of nuisance odors, although construction could result in minor amounts of odorous emissions associated with diesel exhaust or evaporation of VOCs from architectural coatings. These smells are largely due to the presence of sulfur and the creation of hydrocarbons during combustion. As shown in **Table 4.4-22**, above under question (b), construction would not result in significant emissions of SO_x. Furthermore, construction would be temporary, and equipment would not be located in a single location throughout the duration of construction. Odorous hydrocarbons tend to dissipate quickly and would only affect receptors in the immediate vicinity, rather than a substantial number of people at any given time. Therefore, construction activities would not result in other emissions, such as odors, adversely affecting a substantial number of people, and impacts would be less than significant.

Operation

Operation of this Program Component would not result in odor impacts because none of these components include odor-generating components. Pipelines are located belowground, and are enclosed. Thus, no odor emissions would occur. Impacts would be less than significant.

Replenish Big Bear Component 4: Solar Evaporation Ponds Project

Construction

SCAQMD Rule 402 Nuisance, prohibits discharge from any source whatsoever of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety or any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This rule covers generation of odors. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Under the right meteorological conditions, some odors may still be offensive several miles from the source.

Implementation of this Program Component would have the potential to generate odorous emissions during construction activities. Construction activities are not typically sources of nuisance odors, although construction could result in minor amounts of odorous emissions associated with diesel exhaust or evaporation of VOCs from architectural coatings. These smells are largely due to the presence of sulfur and the creation of hydrocarbons during combustion. As shown in **Table 4.4-28**, above under question (b), construction would not result in significant emissions of SO_x. Furthermore, construction would be temporary, and equipment would not be located in a single location throughout the duration of construction. Odorous hydrocarbons tend to dissipate quickly and would only affect receptors in the immediate vicinity, rather than a substantial number of people at any given time. Therefore, construction activities would not result in other emissions, such as odors, adversely affecting a substantial number of people, and impacts would be less than significant.

Operation

As discussed at the beginning of this Subchapter in response to Comment Letter #10 Michael Meyer, between 23 and 57 acres will be used to construct evaporation ponds at the BBARWA WWTP site. The general location of the ponds is shown in **Figure 3-26**. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. Typically, Solar Evaporation Ponds are lined shallow basins in which concentrate evaporates naturally as a result of solar radiation. As the brine evaporates, the minerals in the concentrate are

precipitated in salt crystals, which are removed periodically and disposed off-site. The precipitated crystal will be hauled off to an appropriate disposal facility.

Based on a review of similar solar evaporations pond operations handling brine, odor does not appear to be an issue with operations of this type. BBARWA will maintain the Solar Evaporation Ponds by periodically removing the salt crystals and hauling the precipitated crystal to the local landfill. This is anticipated to prevent odors from accumulating at the Solar Evaporation Ponds and migrating to nearby sensitive receptors. Furthermore, given the location proposed for installation of the Solar Evaporation Ponds at a 0.25 mile distance from the nearest sensitive receptor (residents, hospitals, senior living, churches, schools, etc.) any odors generated by the Solar Evaporation Ponds are anticipated to dissipate at the nearest sensitive receptor. Also, the operations of the existing BBARWA WWTP involve a greater potential for odors to travel, and odor nuisance has not been a significant issue in the community as a result of BBARWA operations. Thus, there has been no indication that odor traveling to sensitive receptors will result from operation of the brine ponds. However, in order to ensure that potential odor from the brine evaporation operations, and avoid potentially significant odor emissions, mitigation (**MM AQ-3**) has been identified that would require odor observation for the first year of the Program, with an odor response component in the event that odors are observed by nearby sensitive receptors. Thus, impacts would be less than significant with the implementation of mitigation.

Replenish Big Bear Component 5: Sand Canyon Recharge Project

Construction

SCAQMD Rule 402 Nuisance, prohibits discharge from any source whatsoever of air contaminants or other materials which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety or any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This rule covers generation of odors. Typical sources of odor complaints include facilities such as sewage treatment plants, landfills, recycling facilities, petroleum refineries, and livestock operations. Under the right meteorological conditions, some odors may still be offensive several miles from the source.

Implementation of this Program Component would have the potential to generate odorous emissions during construction activities. Construction activities are not typically sources of nuisance odors, although construction could result in minor amounts of odorous emissions associated with diesel exhaust or evaporation of VOCs from architectural coatings. These smells are largely due to the presence of sulfur and the creation of hydrocarbons during combustion. As shown in **Table 4.4-33**, above under question (b), construction would not result in significant emissions of SO_x. Furthermore, construction would be temporary, and equipment would not be located in a single location throughout the duration of construction. Odorous hydrocarbons tend to dissipate quickly and would only affect receptors in the immediate vicinity, rather than a substantial number of people at any given time. Therefore, construction activities would not result in other emissions, such as odors, adversely affecting a substantial number of people, and impacts would be less than significant.

Operation

Operation of this Program Component would not result in odor impacts because none of these components include odor-generating components. Pipelines are located belowground, and are enclosed. Furthermore, the monitoring wells and booster pump station would not involve

handling of odorous materials or generation of odor emissions. Thus, no odor emissions would occur. Impacts would be less than significant.

Combined Program Categories

Level of Significance Before Mitigation: Potentially Significant.

Mitigation Measures:

AQ-3: ***BBARWA will establish an odor complaint/response program and will respond to any odor complaints received for this Program by odor levels at the affected receptor following the methodology specified in the ASTM Recommended Practice E679-04. If the odor levels exceed the odor intensity value of 3.0 or greater on the 8-point n-butanol intensity scale, and odor response plan will be developed and initiated to minimize the potential for odor complaints as a result of the solar brine evaporation pond operations. Odor response shall include, but not be limited to, more frequent precipitated crystal removal from the solar brine evaporation pond shall, and application of odor neutralizing materials.***

This odor response/complaint program shall begin once the Solar Evaporation Ponds are operational for at least one year thereafter. If no complaints are received within the first year of operations, the program shall conclude. If one or more complaints are received within the first year of operations, the program shall continue on for the duration of Program operations.

Level of Significance After Mitigation: Less Than Significant.

Implementation of **MM AQ-3** would ensure that the only potential source of new odor generated by the Program—the solar brine evacuation ponds at BBARWA’s WWTP—would be minimized through an odor complaint and response program. Therefore, through the implementation of **MM AQ-3**, Program operations would not result in other emissions, such as odors, adversely affecting a substantial number of people, and no impact would occur.

4.4.6 Cumulative Impacts

As previously shown in **Table 4.4-3**, the CAAQS designate the Program Area as nonattainment for O₃ PM₁₀, and PM_{2.5} while the NAAQS designates the Program Area as nonattainment for O₃ and PM_{2.5}.

AQMD has published a report on how to address cumulative impacts from air pollution: *White Paper on Potential Control Strategies to Address Cumulative Impacts from Air Pollution*. In this report the AQMD clearly states (Page D-3):

“...the AQMD uses the same significance thresholds for project specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or Environmental Impact Report (EIR). The only case where the significance thresholds for project specific and cumulative impacts differ is the Hazard Index (HI) significance threshold for TAC emissions. The project specific (project increment) significance threshold is HI > 1.0 while the cumulative (facility-wide) is HI > 3.0. It should be noted that the HI is only one of three TAC emission significance thresholds considered (when applicable) in a CEQA analysis. The other two are the maximum individual cancer risk (MICR) and the cancer burden, both of which use the same significance thresholds (MICR of 10 in 1 million and cancer burden of 0.5) for project specific and cumulative impacts.

Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.”

Therefore, this analysis assumes that individual projects that do not generate operational or construction emissions that exceed the SCAQMD’s recommended daily thresholds for project-specific impacts would also not cause a cumulatively considerable increase in emissions for those pollutants for which the South Coast Air Basin is in nonattainment, and, therefore, would not be considered to have a significant, adverse air quality impact. Alternatively, individual project-related construction and operational emissions that exceed SCAQMD thresholds for project-specific impacts would be considered cumulatively considerable.

Construction Impacts

The Program-specific evaluation of emissions presented in the preceding analysis demonstrates that Program construction-source air pollutant emissions would not result in exceedances of regional thresholds after implementation of **MM AQ-1** and **MM AQ-3**. Therefore, Program construction-source emissions would be considered less than significant on a project-specific and cumulative basis.

Operational Impacts

The Program-specific evaluation of emissions presented in the preceding analysis demonstrates that Program operation-source air pollutant emissions would not result in exceedances of regional thresholds after implementation of **MM AQ-2**. Therefore, Program operation-source emissions would be considered less than significant on a project-specific and cumulative basis.

4.4.7 Unavoidable Significant Impacts

The Programmatic evaluation of emissions presented in the preceding analysis demonstrates that after implementation of the recommended **MMs**, neither construction or operation of the Program would result in any exceedance of thresholds for a criteria pollutant. Furthermore, the Program is consistent with the AQMP; the air quality impact for Program-related LST impacts are considered to be less than significant; and, sensitive receptors would not be subject to a significant air quality impact during Program construction or operations. Therefore, no unavoidable significant impact to air quality will result from implementing the Program.

4.5 BIOLOGICAL RESOURCES

4.5.1 Introduction

This Subchapter will evaluate the environmental impacts to the issue area of biological resources from implementation of the Replenish Big Bear Program (Program). The thresholds analyzed in this Subchapter are derived from Appendix G of the State CEQA Guidelines, which identifies the issues that examine whether the proposed Program would have a substantial adverse effect upon biological resources on a given proposed Program site as well as a substantial effect upon any biological resources adjacent to a given proposed Program site, or otherwise indirectly resulting in impacts to biological resources as a result of a implementation of a combination of Program projects or a singular Program project.

The analysis herein, while prepared under a Programmatic DEIR, has been provided as the project level for all of the facilities proposed under this Program, with one exception: the monitoring wells at Sand Canyon as the specific locations of the monitoring wells is presently unknown. Additionally, the specific impacts on the Stickleback resulting from the change in water source proposed by the Program have not been forecasted in detail because this Program components will not be implemented in the short-term. However, the procedure by which impacts to this species from changing the water source at Shay Pond to advanced treated water must be analyzed in the future to be provided herein. Sufficient detail for all other projects proposed under this Program is available for project level impact forecasts.

The NOP determined that all of these issue areas would be analyzed in the DPEIR. These issues will be discussed below as set forth in the following framework:

- 4.5.1 Introduction
- 4.5.2 Environmental Setting: Biological and Physical Conditions of the Big Bear Valley
- 4.5.3 Regional Special Status Species and Habitats of Concern
- 4.5.4 Regulatory Setting
- 4.5.5 Thresholds of Significance
- 4.5.6 Potential Impacts
- 4.5.7 Cumulative Impact
- 4.5.8 Unavoidable Adverse Impacts

Two comments specific to this topic were received in response to the NOP, and two comments specific to this topic were received at the Scoping Meeting held on behalf of the Program. NOP Comment Letters and Responses to NOP Comments can be found in **Subchapter 8.2**.

Much of the following text is abstracted directly from the Biological Resources & Jurisdictional Delineation Assessment (BRA) prepared by Jacobs Engineering Group (Jacobs), provided as **Appendix 12** of Volume 2.

4.5.2 Environmental Setting

Note that all references provided herein can be found in the BRA prepared by Jacobs, provided as **Appendix 12** of Volume 2 to this DPEIR, in addition to the Memo prepared by GEI, provided as **Appendix 19** of Volume 2 to this DPEIR.

The Program Area is situated east/southeast of Big Bear Lake, in the Big Bear Valley area of the San Bernardino Mountains (**refer to Figures 4.5-1 through 4.5-9**). The Big Bear Valley area is subject to both seasonal and annual variations in temperature and precipitation. Average annual maximum temperatures peak at 80.8 °F in July and fall to an average annual minimum temperature of 20.3° F in January. Average annual precipitation ranges from nearly 40 inches at the west end of Big Bear Lake to 10-15 inches at the east end of the Big Bear Valley. Annual precipitation is highly variable, as it is common to have long dry periods (three to eight years) mixed with years of above-average precipitation.

The topography of the proposed Program Area footprint is flat, being mostly within existing paved roadways, WWTP facilities, and disturbed/graded areas. Much of the proposed Program would be implemented within and around Big Bear City, which has an elevation of approximately 6,770 feet amsl. However, the Sand Canyon Recharge Area are within the unincorporated community of Moonridge, which is south of Big Bear City. The Moonridge residential area is a mountain community built on moderate to steep slopes. The elevation of the proposed Sand Canyon Recharge Project ranges from approximately 7,275 feet amsl at the Sand Canyon Recharge Pipe Outlet, to 7,350 feet amsl at the highest point of the proposed conveyance pipeline.

Hydrologically, the Program Area is situated within the Bear Valley and Baldwin Hydrologic Sub-Areas (HSA 801.71 and 801.73). The Bear Valley HSA comprises a 34,333-acre drainage area, within the larger Santa Ana Watershed (Hydrologic Unit Code [HUC] 18070203). The Baldwin HSA comprises a 22,789-acre drainage, also within the Santa Ana Watershed. The Santa Ana River is the major hydrogeomorphic feature within the Santa Ana Watershed. One of several tributaries to the Santa Ana River is Bear Creek, which outflows from Big Bear Lake from the Bear Valley Dam located at the westernmost (downstream) end of Big Bear Lake. Big Bear Lake is one of the head waters of the Santa Ana River Watershed.

Soils are discussed in detail within the Geology and Soils Subchapter of this DPEIR (**Subchapter 4.8**). The following is extracted from this Subchapter, including the corresponding Table numbers. Soils within the Big Bear Valley generally include deep well-drained sands, sandy loams, silty loams on level alluvial basins and fans; and shallow to deep, well to excessively drained, sandy loams on the valley floor and on upland ridge areas (NRCS, 2022). The soils present within the service area vary slightly in physical properties but share similar characteristics. Soils within the eastern portion of the Big Bear Valley are presented in **Figure 4.8-7** and summarized in **Table 4.8-1**.

Replenish Big Bear Project

FIGURE 4.5-9

**Table 4.8-1
 EASTERN BIG BEAR VALLEY SOILS**

Map Unit Symbol	Map Unit Name	Acres in Area of Interest	Percent of Area of Interest
132	Aquents-Grunney complex, 0 to 4 percent slopes	218.4	20.5%
301	Garloaf-Cariboucreek complex, 15 to 30 percent slopes	1.2	0.1%
302	Garloaf-Cariboucreek-Urban land complex, 9 to 15 percent slopes	9.2	0.9%
305	Moonridge-Shayroad-Cariboucreek complex, 0 to 4 percent slopes	197.4	18.5%
306	Moonridge-Cariboucreek-Urban land complex, 0 to 4 percent slopes	598.0	56.1%
309	Goldmountain-Deadmansridge-Deadpan complex, 15 to 30 percent slopes	0.6	0.1%
310	Goldmountain-Deadmansridge-Deadpan complex, 30 to 50 percent slopes	30.5	2.9%
315	Minnelusa-Cariboucreek complex, 9 to 15 percent slopes	10.1	1.0%
Totals for Area of Interest		1,065.4	100%

The soils in the vicinity of the Sand Canyon are shown on **Figure 4.8-8** and are summarized in **Table 4.8-2**. The most unusual soil complex occurs at the existing WWTP that will include the AWPf in the future when the new treatment facilities have been installed. The soil on the Baldwin Lakebed has a higher concentration of clay materials than the other soils that underlay the remaining Program Areas.

The Big Bear Valley area is comprised of small mountain communities in the SBNF that consist of a mix of residential and commercial development surrounded by undeveloped montane conifer forest (**Figures 4.5-1 through 4.5-3**). Existing land use surrounding the proposed Program footprint consists of residential neighborhoods, WWTP facilities, municipal airport, Stanfield Marsh and Baldwin Lake, and open space. Adjacent undeveloped National Forest land supports a mix of montane conifer forests, shrublands, and montane meadow, and ruderal plant communities.

**Table 4.8-2
 SAND CANYON SOILS**

Map Unit Symbol	Map Unit Name	Acres in Area of Interest	Percent of Area of Interest
401	Garloaf-Cariboucreek-Urban land complex, 15 to 30 percent slopes	48.4	44.4%
413	Aquents-Riverwash complex, 0 to 4 percent slopes	46.9	43%
414	Moonridge-Urban land complex, 4 to 9 percent slopes	9.9	9.1%
BoD	Morical, very deep-Hecker families complex, 2 to 15 percent slopes	1.7	1.5%
BoE	Morical, very deep-Hecker families complex, 15 to 30 percent slopes	0.4	0.3%
DaF	Pacifico-Wapi families complex, 30 to 50 percent slopes	1.8	1.6%
Totals for Area of Interest		109	100%

Existing Biological and Physical Conditions

The proposed Program Area footprint is within both urban and natural/semi-natural environments. The East Neighborhoods, Meadow Lane, and West Neighborhoods Pipeline Alignment Options and associated discharge outlets (**Figure 4.5-4**), as well as the Sand Canyon recharge conveyance pipeline and associated discharge outlet, Sand Canyon Monitoring Wells, and new 600 gpm pump station at the existing Resort Storage Pond are all situated in a residential development setting (**Figure 4.5-5**; **Figure 4.5-6**). These conveyance pipeline alignments are entirely within existing disturbed/developed areas including paved roadways. The North Airport Corridor Pipeline Alignment Option is within a public airport setting, surrounded by residential development (**Figure 4.5-6**). The remaining monitoring wells, pump stations, and WWTP upgrades are situated within existing developed WWTP facilities (**Figure 4.5-9**). The proposed solar energy facilities would be constructed on existing rooftops and adjacent previously disturbed/graded areas around the BBARWA WWTP (**Figure 4.5-9**).

The Baldwin Lake Pipeline Alignment Option follows an existing unpaved trail alignment (West Baldwin Lake Trail) within montane meadow, shrubland, and temporarily to seasonally flooded lacustrine habitats (**Figure 4.5-6**). The Shay Pond Conveyance Pipeline would be constructed within an existing unpaved road (Cascade Street) surrounded by rural residential development and montane meadow habitat (**Figure 4.5-8**). The proposed Solar Evaporation Ponds would be constructed on BBARWA WWTP property, within a previously disturbed/graded section of Baldwin Lake consisting of temporarily to seasonally flooded lacustrine habitat (**Figure 4.5-9**).

Disturbances in the Program Area consist mostly of vehicular traffic and pedestrian use associated with the existing roads and residential developments, as well as existing utility infrastructure (i.e., the BBARWA WWTP) and associated WWTP operations. Other disturbances include feral livestock grazing in the vicinity of Shay Pond, domestic livestock grazing on the BBARWA WWTP property, disturbances associated with ongoing airport maintenance and operations at the Big Bear Airport, vegetation removal/weed abatement, and illegal dumping.

4.5.2.1 Habitat

Habitats present within and/or adjacent the Program Area include:

- *Pinus jeffreyi* Forest & Woodland Alliance (Jeffrey pine forest and woodland)
- *Juniperus grandis* Woodland Alliance (mountain juniper woodland)
- *Artemisia tridentata* Shrubland Alliance (big sagebrush)
- *Schoenoplectus acutus* Herbaceous Alliance (hardstem bulrush marsh)
- Wet montane meadow habitat
- Temporarily-to-seasonally flooded lake (Baldwin Lake)

Sand Canyon

The undeveloped SBNF adjacent the Sand Canyon Recharge Conveyance Pipeline and Sand Canyon Conveyance Pipeline Discharge Outlet, Sand Canyon Monitoring Wells, and new 600 gpm pump station at the existing Resort Storage Pond supports mixed Jeffrey pine forest and woodland and mountain juniper woodland habitats. The Jeffrey pine forest and woodland habitat is characterized by an open to continuous tree canopy, with a sparse to intermittent shrub layer and varied herbaceous layer (Sawyer et al. 2009). The mountain juniper woodland habitat is characterized by an open to intermittent tree canopy, with a sparse to intermittent shrub layer and sparse or grassy herbaceous layer (Sawyer et al. 2009). Dominant or otherwise conspicuous species in these plant communities include Jeffrey pine (*Pinus jeffreyi*), Sierra juniper (*Juniperus grandis*), California black oak (*Quercus kelloggii*), white fir (*Abies concolor*), manzanita (*Arctostaphylos* spp.), common sagebrush (*Artemisia tridentata*), and desert mountain mahogany (*Cercocarpus ledifolius*).

Shay Pond

The habitat surrounding the Shay Pond Conveyance Pipeline alignment (Cascade Street) and discharge outlet consists of a mosaic of ruderal vegetation, big sagebrush, and wet montane meadow habitat. The big sagebrush habitat within this area is characterized by an open canopy, with a sparse to intermittent shrub layer dominated by common sagebrush (*Artemisia tridentata*) and an intermittent grassy herbaceous layer (Sawyer et al. 2009). The wet montane meadow habitat in this area is dominated by sedge (*Carex* spp.), rush (*Juncus* spp.), and beardless wild rye (*Elymus triticoides*). Non-native and ruderal vegetation within this area consists mostly of brome grasses (*Bromus* spp.), Russian thistle (*Salsola tragus*), and tumble mustard (*Sisymbrium altissimum*).

Baldwin Lake

The habitat surrounding the Baldwin Lake Pipeline Alignment Option consists of temporarily to seasonally flooded lake at the eastern end of the proposed alignment, transitioning to wet montane meadow habitat toward the middle of the alignment, and big sagebrush habitat near the western end of the alignment. Dominant species within these plant communities include fox tail barley (*Hordeum jubatum*), summer cypress (*Kochia scoparia*), prickly lettuce (*Lactuca serriola*), *Carex* spp., *Juncus* spp., beardless wild rye, and common sagebrush, respectively.

The proposed Solar Evaporation Ponds would be constructed within a previously disturbed/graded section of Baldwin Lake consisting of temporarily to seasonally flooded lacustrine habitat. Plant communities in this area consist of hardstem bulrush marsh dominated by tule (*Schoenoplectus acutus*), wet montane meadow habitat dominated by *Carex* spp. and *Juncus* spp., and ruderal vegetation dominated by goosefoot (*Chenopodium chenopodioides*), fox tail barley, summer cypress, and prickly lettuce.

The proposed solar energy facilities would be constructed on existing rooftops and adjacent previously disturbed/graded areas around the BBARWA WWTP consisting of bare ground and ruderal vegetation dominated by *Bromus* spp., Coastal heron's bill (*Erodium cicutarium*), summer cypress, prickly lettuce, and tumble mustard.

Please refer to Appendix C of the BRA for a complete list of all plant species observed on site during surveys.

4.5.2.2 Wildlife

This section details wildlife over the whole of the Program Area in Big Bear Valley. The proposed Program Area footprint is mostly within existing residential and commercial developments and the only species expected to occur within these areas are those adapted to an urban environment. During the survey, special attention was focused on those Program components that are within or immediately adjacent undeveloped areas, where special status species are more likely to occur, including the Baldwin Lake Pipeline Alignment Option, the proposed Solar Evaporation Ponds and solar energy facilities sites, the Shay Pond Conveyance Pipeline and discharge outlet site, and the Sand Canyon Recharge Pipe Outlet site. However, all facility locations that are known (all but the Sand Canyon Monitoring Wells) were surveyed for potential to support special status species.

Amphibians and Reptiles

The only amphibian species observed or otherwise detected within the Program Area during the reconnaissance level survey was the California toad (*Anaxyrus boreas halophilus*). Reptile species observed within the Program Area during survey included Skilton's skink (*Plestiodon skiltonianus skiltonianus*) and southern sagebrush lizard (*Sceloporus graciosus vandenburgianus*). Other common herp species expected to occur within the Program Area include southern Pacific rattlesnake (*Crotalus oreganus helleri*), San Diego alligator lizard (*Elgaria multicarinata webbiai*), San Diego gophersnake (*Pituophis catenifer annectens*), Great Basin fence lizard (*Sceloporus occidentalis longipes*), and mountain gartersnake (*Thamnophis elegans elegans*).

Birds

Birds were the most observed wildlife group during survey and species observed or otherwise detected in the Program Area during the reconnaissance level survey included:

- Red-winged Blackbird (*Agelaius phoeniceus*)
- Mallard (*Anas platyrhynchos*)
- Bufflehead (*Bucephala albeola*)
- Killdeer (*Charadrius vociferus*)
- Northern Flicker (*Colaptes auratus*)
- Common Raven (*Corvus corax*)
- Steller's Jay (*Cyanocitta stelleri*)
- Horned Lark (*Eremophila alpestris*)
- Brewer's Blackbird (*Euphagus cyanocephalus*)
- American Coot (*Fulica americana*)
- House Finch (*Haemorhous mexicanus*)
- Dark-eyed Junco (*Junco hyemalis*)
- American Wigeon (*Mareca americana*)
- Acorn Woodpecker (*Melanerpes formicivorus*)
- Brown-headed Cowbird (*Molothrus ater*)

- Ruddy Duck (*Oxyura jamaicensis*)
- Savannah Sparrow (*Passerculus sandwichensis*)
- Cliff Swallow (*Petrochelidon pyrrhonota*)
- Eared Grebe (*Podiceps nigricollis*)
- Pied-billed Grebe (*Podilymbus Podiceps*)
- Mountain Chickadee (*Poecile gambeli*)
- Western Bluebird (*Sialia mexicana*)
- Pygmy Nuthatch (*Sitta pygmaea*)
- Violet-green Swallow (*Tachycineta thalassina*)
- American Robin (*Turdus migratorius*)

Mammals

Mammal species observed or otherwise detected within the Program Area during the reconnaissance level survey included coyote (*Canis latrans*), California ground squirrel (*Otospermophilus beecheyi*), western gray squirrel (*Sciurus griseus*), and Botta's pocket gopher (*Thomomys bottae*). Other common mammal species expected to occur within the Program Area include bobcat (*Lynx rufus*), Merriam's chipmunk (*Neotamias merriami*), mule deer (*Odocoileus hemionus*), raccoon (*Procyon lotor*), and American black bear (*Ursus americanus*). Additionally, numerous feral donkeys (*Equus asinus*) were observed during survey in the vicinity of Shay Pond and several domestic cattle were observed on Baldwin Lake at the BBARWA WWTP.

4.5.2.3 Jurisdictional Waters

The Program Area is within the Bear Valley and Baldwin Hydrologic Sub-Areas (HSA 801.71 and 801.73). The Bear Valley HSA comprises a 34,333-acre drainage area, within the larger Santa Ana Watershed (HUC 18070203). The Baldwin HSA comprises a 22,789-acre drainage, also within the Santa Ana Watershed. This watershed is primarily within San Bernardino County and includes portions of Riverside and Orange Counties with a small portion of Los Angeles County. The Santa Ana Watershed is bound on the north by the Mojave and Southern Mojave Watersheds, on the southeast by the Whitewater River and San Jacinto Watersheds, and on the west by the San Gabriel, Seal Beach, Newport Bay, and Aliso-San Onofre Watersheds. The Santa Ana Watershed encompasses a portion of the San Gabriel and San Bernardino Mountains in the north and is approximately 3,000 square miles in area. The Santa Ana River is the major hydrogeomorphic feature within the Santa Ana Watershed. One of several tributaries to the Santa Ana River is Bear Creek, which outflows from Big Bear Lake from the Bear Valley Dam located at the westernmost (downstream) end of Big Bear Lake. Big Bear Lake is one of the head waters of the Santa Ana River Watershed.

4.5.3 Regional Special Status Species and Habitats of Concern

Special status species are plants or animals that are legally protected under the Federal Endangered Species Act (FESA), CESA, or other regulations, as well as species considered sufficiently rare by the scientific community to qualify for such listing. Special-status species include the following:

- Species listed or proposed for listing as threatened or endangered under the FESA (50 Code of Federal Regulations [CFR] 17.12 [listed plants]); 50 CFR 17.11 (listed animals); and various notices in the *Federal Register* (proposed species).
- Species that are candidates for possible future listing as threatened or endangered under FESA (76 Fed. Reg. 66370, October 26, 2011).

- Species listed or proposed for listing by the State of California as threatened or endangered under CESA (14 California Code of Regulations 670.5).
- Species that meet the definitions of "rare" or "endangered" under CEQA (State CEQA Guidelines § 15380).
- Plants presumed by the California Native Plant Society (CNPS) to be "extinct in California" (Lists 1A, CNPS 2020).
- Plants considered by the CNPS to be "rare, threatened, or endangered in California" (Lists 1B and 2, CNPS 2020).
- Plants listed by CNPS as plants about which more information is needed to determine their status (List 3, CNPS 2020), and which may be included as special-status species on the basis of local significance or recent biological information.
- Plants listed by CNPS as plants of limited distribution or infrequent throughout a broader area in California (List 4, CNPS 2020); these plants are not "rare" from a statewide perspective but are uncommon enough that they are recommended for inclusion in environmental documents.
- Plant species listed as rare under the California Native Plant Protection Act (FGC §§ 1900, et seq.).
- Animal species of special concern to the CDFW (CDFW 2019).
- Bird species of conservation concern as identified by USFWS in *Birds of Conservation Concern 2008* (USFWS 2008).
- Animals that are fully protected in California (FGC Sections 3511 [birds], 4,700 [mammals], 5050 [amphibians and reptiles], and 5515 [fish]) (CDFW 2011).

According to the CNDDDB, 102 special status species (73 plant species, 29 animal species) and two sensitive habitats have been documented in the *Big Bear Lake, Big Bear City, Fawnskin* and *Moonridge* USGS 7.5-Minute Series Quadrangles (refer to Appendix A of the BRA). This list of special status species and habitats includes any State and/or Federally listed threatened or endangered species, California Fully Protected species, CDFW designated Species of Special Concern (SSC), and otherwise Special Animals. "Special Animals" is a general term that refers to all the taxa the CNDDDB is interested in tracking, regardless of their legal or protection status. This list is also referred to as the list of "species at risk" or "special status species." The CDFW considers the taxa on this list to be those of greatest conservation need.

The USFWS Information for Planning and Consultation System (IPaC) search identified three additional special status species as potentially occurring in the regional vicinity of the proposed Program. Of the 105 special status species identified by the CNDDDB and IPaC queries, 21 are State and/or Federally listed or proposed for listing as threatened or endangered species. **Table 4.5-1** (below) provides a list of all State and/or Federally listed or proposed threatened and endangered species identified by the CNDDDB and IPaC queries, where they are found (locally, adjacent to the proposed Program Area footprint, or within the proposed Program Area footprint), if suitable habitat for that species exists within the Program Area and whether the Program may affect that species.

**Table 4.5-1
 PROGRAM AREA WILDLIFE HABITAT TYPES, LAND USES, AND TYPICAL VEGETATION**

Common Name	Scientific Name	Status
Plants:		
Cushenbury oxytheca	<i>Acanthoscyphus parishii</i> var. <i>goodmaniana</i>	FE
Cushenbury milk-vetch	<i>Astragalus albens</i>	FE

Common Name	Scientific Name	Status
ash-gray paintbrush	<i>Castilleja cinerea</i>	FT
Big Bear Valley sandwort	<i>Eremogone ursina</i>	FT
Parish's daisy	<i>Erigeron parishii</i>	FT
southern mountain buckwheat	<i>Eriogonum kennedyi</i> var. <i>austromontanum</i>	FT
Cushenbury buckwheat	<i>Eriogonum ovalifolium</i> var. <i>vineum</i>	FE
San Bernardino Mountains bladderpod	<i>Physaria kingii</i> ssp. <i>bernardina</i>	FE
San Bernardino blue grass	<i>Poa atropurpurea</i>	FE
bird-foot checkerbloom	<i>Sidalcea pedata</i>	FE/SE
California dandelion	<i>Taraxacum californicum</i>	FE

Notes: FE = Federally Endangered FT = Federally Threatened SE = State Endangered ST = State Threatened

The aquatic habitats required by southern mountain yellow-legged frog are absent from the Program Area and this species is considered extirpated from the Big Bear Valley (USFWS 2019). Likewise, the Program Area is outside the current range of the southern California steelhead (NMFS 2023). Additionally, the habitats required by southwestern willow flycatcher (i.e., riparian) and Mojave desert tortoise (i.e., desert scrub/desert woodland) are absent from the Program Area and these species have not been documented in the Program vicinity (within approximately three miles). Therefore, no further discussion of these species is warranted.

Although not a State or Federally listed species, the San Bernardino flying squirrel (*Glaucomys sabrinus californicus*) is a CDFW SSC and is considered a particularly sensitive species within the region. Furthermore, this species has been documented in the Program vicinity (within approximately three miles). Therefore, San Bernardino flying squirrel will be included in the impact analysis presented below, along with the State and/or Federally listed species that have been documented in the Program vicinity.

An analysis of the likelihood for occurrence of all CNDDDB special status species documented in the *Big Bear Lake*, *Big Bear City*, *Fawnskin*, and *Moonridge* quads is provided in Appendix A of the BRA. This analysis considers species' range as well as documentation within the vicinity of the Program Area and includes the habitat requirements for each species and the potential for their occurrence on site, based on required habitat elements and range relative to the current site conditions. A complete list of all special status species identified by the IPaC, CNDDDB, and California Native Plant Society Electronic Inventory (CNPSEI) databases as potentially occurring in the Program vicinity is provided in Appendix F of the BRA.

4.5.3.1 Special Status Plant and Animal Species Potentially Occurring Along or Within the Program Assessment Areas, Specific to the Program

The only State and/or Federally listed threatened or endangered species observed in the Program Area during survey was the State and Federally listed as endangered bird-foot checkerbloom (see analysis presented in **Subsection 4.5.6, Potential Impacts**). However, there is habitat within the Program Area that is suitable to support several other listed species that have been documented in the Program vicinity.

Special Status Plant Species with Potential for Occurrence in the Program Area

Cushenbury Milk-vetch – Endangered (Federal)

The Federally listed as endangered Cushenbury milk-vetch is a silvery-white (pubescent), short-lived perennial herb in the pea family (Fabaceae). The stems form loose, prostrate mats, up 30 centimeters (11.8 inches) wide. The leaves are pinnately compound with 5 to 9 leaflets. The spreading or reflexed inflorescences (flower clusters) support 5 to 14 pink-purple bilateral flowers that develop crescent shaped fruit pods.³⁷ This species is typically found in rocky, carbonate substrates along washes and slopes within pinyon woodland, pinyon-juniper woodland, Joshua tree woodland, and blackbush scrub habitats on the northern (desert) slopes of the San Bernardino Mountains at elevations between 1,185 and 1,950 meters (3,888 to 6,397 feet). Cushenbury milk-vetch is typically found on soils derived directly from decomposing limestone rock.³⁸ This species typically blooms from March through June³⁹.

Suitable Habitat Locations in Program Area:

- None

Ash-gray Paintbrush – Threatened (Federal)

The Federally listed as threatened ash-gray paintbrush is a hemiparasitic, perennial herb in the broomrape family (*Orobanchaceae*), with several ascending to decumbent (trailing) grayish stems sprouting from the root crown. The stems are 1 to 2 decimeters (4 to 8 inches) tall. Ash-gray paintbrush is distinguished from other species of *Castilleja* within its range by its perennial nature, ashy-puberulent (covered with short hairs) stems and leaves, yellowish or reddish flowers, with calyx lobes of equal length. Host plants include *Eriogonum kennedyi* var. *austromontanum*, *Eriogonum kennedyi* var. *kennedyi*, *Eriogonum wrightii* var. *subscaposum*, *Artemisia tridentata*

ssp. *tridentata*, *Artemisia nova*, and other *Artemisia taxa*.⁴⁰ However, because this species also possesses photosynthetic green leaves that can produce sugars, it is termed hemiparasitic and does not require a host plant species for its survival. This species typically occupies the meadow/forest ecotone (transitional area of vegetation between two different plant communities) of the San Bernardino Mountains at elevations between 1,800 and 3,300 meters (5,905 to 10,827 feet.) and has been recorded in the following ecological communities: pebble plains, dry and wet forest meadows, mixed conifer forests, open pine forests, and pinyon-juniper woodlands. However, the primary habitat for this species is pebble plains, supporting one or more of the host plant species for ash-gray paintbrush. This species typically blooms from June through August.

Suitable Habitat Locations in Program Area:

- BBARWA WWTP Upgrades
- Baldwin Lake Pipeline Alignment Option

Big Bear Valley Sandwort – Threatened (Federal)

The Federally listed as threatened Big Bear Valley sandwort is a low, tufted perennial herb in the pink family (*Caryophyllaceae*). Individual plants are green, with stems from 10 to 18 centimeters (3.9 to 7.1 inches) long. The leaves are opposite and 0.5 to 1 centimeter (0.2 to 0.39 inches) long. The flowers are white, five-petaled, and arranged in open cymes (clusters). The petals are 0.2 to 0.45 centimeters (0.1 to 0.18 inches) long.⁴¹ This species is typically found in pebble plain habitat in the northeastern San Bernardino Mountains of southwest San Bernardino County at elevations between 1,950 and 2,100 meters (6,393 to 6,885 feet.). Pebble plains are a rare plant community that occur in treeless, open patches within pine forests and pinyon-juniper woodlands that are comprised of clay soil mixed with quartzite pebbles and gravel that are continually pushed to the surface through frost action. Big Bear Valley sandwort is typically found within pebble plain habitat and is one of three indicator plant species, along with *Eriogonum kennedyi* var. *austromontanum*, and *Ivesia argyrocoma* var. *argyrocoma* defining a pebble plain. This species typically blooms from May through August.

Suitable Habitat Locations in Program Area:

- None

Parish's Daisy – Threatened (Federal)

The Federally listed as endangered Parish's daisy is a small perennial herb (subshrub) in the aster family (*Asteraceae*). The vertically oriented stems are few-branched near the mid-stem, silvery-hairy, especially distally, and grow to 10 to 35 centimeters (3.9 to 13.8 inches) in height.⁴² The cauline leaves (sometimes absent by flowering) are linear and silvery-strigose. The composite flowers typically include 30 to 50 pink or white ray flowers. Parish's daisy typically occurs on rocky slopes, active washes, and outwash plains, in pinyon woodland, pinyon-juniper woodland, and blackbush scrub habitats along the northern (desert) slopes of the San Bernardino Mountains and Little San Bernardino Mountains at elevations between 1,050 and 2,245 meters

(3,445 to 7,365 feet).⁴³ This species is typically found on soils derived directly from decomposing limestone or dolomite. Parish's daisy typically blooms from May through August.

Suitable Habitat Locations in Program Area:

- None

Southern Mountain Buckwheat – Threatened (Federal)

The Federally listed as threatened southern mountain buckwheat is a woody-based, cushion-like, perennial plant in the buckwheat family (*Polygonaceae*). Individual plants are 8 to 15 centimeters (3.1 to 5.9 inches) tall, with stems forming loose, leafy mats, 14 to 36 centimeters (5.5 to 14.1 inches) wide. The leaves are oblanceolate (broadest above the middle and tapering toward the base) and 0.5 to 1 centimeter (0.2 to 0.4 inches) long, with dense white hair. The inflorescences (flower clusters) are 8 to 15 centimeters (3.2 to 5.9 inches) high, bearing head-like inflorescences. The perianth is white to rose and composed of inner and outer lobes that are similar in appearance.⁴⁴ This species is typically found in pebble plain habitat in the northeastern San Bernardino Mountains of southwest San Bernardino County at elevations between 2,000 and 2,200 meters (6,557 to 7,213 feet.). Southern mountain buckwheat is typically found within pebble plain habitat and is one of three indicator plant species, along with *Eremogone ursina*, and *Ivesia argyrocoma* var. *argyrocoma* defining a pebble plain. This species typically blooms from June through September.

Suitable Habitat Locations in Program Area:

- None

Cushenbury Buckwheat – Endangered (Federal)

The Federally listed as endangered Cushenbury buckwheat is a low, densely matted perennial in the buckwheat family (*Polygonaceae*) that reaches approximately 10 centimeters (4 inches) in height and forms a mat up to 51 centimeters (20 inches) in diameter.⁴⁵ This species is typically found within pinyon woodland, pinyon-juniper woodland, Joshua tree woodland, and blackbush scrub habitats on limestone or other carbonate soils at elevations between 1,400 and 2,400 meters (4,600 and 7,900 feet) in the San Bernardino Mountains. This species typically blooms from May to August.

Suitable Habitat Locations in Program Area:

- None

San Bernardino Mountains bladderpod – Endangered (Federal)

The Federally listed as endangered San Bernardino Mountains bladderpod is a silvery, short-lived perennial in the mustard family (*Brassicaceae*), that reaches approximately 5 to 15 centimeters (2 to 6 inches) in height.⁴⁶ The outer basal leaves are diamond-shaped to round, and the inner leaves are elliptic with petioles 2 to 5 centimeters (0.8 to 2 inches) long. The flower petals are

yellow, and the fruits are spherical, pubescent, two-chambered, and contain 2 to 4 seeds per chamber. This species is typically found within single leaf pinyon-mountain juniper and white fir forest on limestone and dolomite soils and gentle to moderate slopes at elevations between 2,098 and 2,700 meters (6,883 and 8,800 feet) in the San Bernardino Mountains. This species typically blooms from May to June.

Suitable Habitat Locations in Program Area:

- None

San Bernardino Blue Grass – Endangered (Federal)

The Federally listed as endangered San Bernardino blue grass is a rhizomatous, tufted, perennial herb in the grass family (*Poaceae*) that grows to approximately 10 to 55 centimeters (1.2 to 2.8 inches) tall. This species is dioecious and the unisexual flower inflorescences (flower clusters) are 3 to 7 centimeters (3.2 to 5.9 inches) long, with smooth, appressed branches and glabrous spikelets.⁴⁷ San Bernardino blue grass occurs only in montane meadows at altitudes from 1,800 to 2,300 meters (5906 to 7546 feet) in San Bernardino and San Diego Counties.⁴⁸ This species typically blooms from May through September.

Suitable Habitat Locations in Program Area:

- Shay Pond Replacement Pipeline
- Shay Pond Conveyance Pipeline Alignment
- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Pipeline Alignment Option

Bird-foot Checkerbloom – Endangered (Federal/State)

The State and Federally listed as endangered bird-foot checkerbloom is a perennial herb in the mallow family (*Malvaceae*), with erect stems that grow to approximately 20 to 40 centimeters (7 to 16 inches) from a fleshy, nonrhizomatous taproot. This species is gynodioecious, with up to 25-centimeter-long, spike-like inflorescences that produce either bisexual or pistillate flowers that are rose-pink to magenta in color with dark veins.⁴⁹ The basal, cauline leaves are ternate-dissected, palmately five to seven parted into narrow, three lobe divisions, which are further dissected into linear to oblong segments.⁵⁰ Bird-foot checkerbloom occurs only in vernal moist meadows and sparsely vegetated, drier meadow sites at elevations from 1,600 to 2,500 meters (5,250 to 8,200 feet) in the Big Bear Valley of the San Bernardino Mountains in San Bernardino County. This species typically blooms from May through August.

California Dandelion – Endangered (Federal)

The Federally listed as endangered California dandelion is a perennial herb in the aster family (*Asteraceae*) with 10 to 20 basal, oblanceolate, generally toothed, or occasionally shallowly lobed leaves, that grows to approximately 5 to 20 centimeters (2 to 8 inches) tall. This species produces yellow composite flowers with erect outer phyllaries that are lance-ovate to widely ovate with hornless tips and rounded, generally hornless main phyllaries.⁵¹ California dandelion can be distinguished from the sympatric, nonnative, common dandelion (*Taraxacum officinale*) by the sharply cut or recurved-lobed leaves and reflexed outer phyllaries observed in the flowering plant of the latter species.⁵² California dandelion occurs only in the relatively open edges or margins of moist meadow habitats at altitudes from 2,000 to 2,800 meters (6,700 to 9,000 feet) in the San Bernardino Mountains in San Bernardino County. This species typically blooms from May through August.

Suitable Habitat Locations in Program Area:

- Baldwin Lake Pipeline Alignment Option

Slender-petaled Thelypodium – Endangered (Federal)

The State and Federally listed as endangered slender-petaled thelypodium is a glabrous (lacks hairs), biennial herb in the mustard family (*Brassicaceae*) with a rosette of wavy basal leaves and 30 to 90 centimeter (11.8 to 35.4 inch) tall, simple, or branched distally stems, which have mid-cauline sessile, sagittate to clasping, entire leaves. This species has small lavender or white flowers with narrow (0.3 to 0.5 millimeter wide) linear petals that are crinkled between the blade and claw.⁵³ Slender-petaled thelypodium produces narrow, linear fruits that are 3 to 5 centimeters (1.2 to 2 inches) long.⁵⁴ This species occurs on vernal moist alkaline meadows, alkaline flats, and lakeshores at altitudes from 1,600 to 2,500 meters (5,250 to 8,200 feet) in the Big Bear Valley of the San Bernardino Mountains in San Bernardino County. All known populations of slender-petaled thelypodium are found on alkaline clay soils crossed by annually moist seeps and streams, indicating that soil hydrology is an important factor in determining distribution. This species is found towards the drier edges of moist meadows, or drier sparsely vegetated meadows, often growing up through sagebrush shrubs. This species typically blooms from May through September.

Special-Status Animal Species with Potential for Occurrence in the Program Area

Unarmored Threespine Stickleback – Endangered (Federal/State)

The State and Federally listed as endangered Stickleback is a small (up to six centimeters [2.4 inches]) freshwater fish in the stickleback family (*Gasterosteidae*) that is distinguished from the other two threespine stickleback subspecies primarily in that it lacks any protective lateral plates (modified scales). The Stickleback typically inhabits slow-moving streams or quiet-water microhabitats in swifter streams and rivers.⁵⁵ This species feeds on aquatic invertebrates and prefers aquatic refugia consisting of dense and abundant vegetation, algal mats, or barriers to swift water such as sand bars, floating vegetation, or low-flow road crossings. Although the Stickleback reproduces year-round, breeding activity usually slows from October to January, and this species likely only lives for about one year.

Historically, Stickleback occurred in many watersheds throughout southern California, including the headwaters of the Santa Clara River and low gradient parts of the Los Angeles River, San Gabriel River, and Santa Ana River in the Los Angeles Basin, the Santa Maria River drainage in San Luis Obispo County, and San Antonio Creek in Santa Barbara County.⁵⁶ In 1970, the Stickleback was listed as endangered under the Endangered Species Preservation Act of 1966 as a result of population declines due to urbanization, eutrophication, stream channelization, water releases, groundwater removal, declining water quality, nonnative predators, disease, introgression, competition, and stochastic extinction. In the San Bernardino Mountains, Stickleback is currently considered extant at only three sites: Sugarloaf Meadow Pond, Juniper Springs Pond, the vicinity of Shay Creek. The Shay Creek population of Stickleback at Shay Pond persists due to BBCCSD discharges of approximately 50 AFY of supplemental water into Shay Pond to prevent desiccation. The status of the remaining Stickleback population from the vicinity of Shay Creek, including those in Motorcycle Pond, Shay Creek, Weibe's Pond, and Baldwin Lake are considered intermittent or unknown (i.e., Weibe's Pond), primarily due to the ephemeral hydrologic regime within the Shay Creek system.

Suitable Habitat Locations in Program Area:

- Shay Pond Replacement Pipeline
- Shay Pond Conveyance Pipeline Alignment

Quino Checkerspot Butterfly – Endangered (Federal)

The Federally listed as endangered quino checkerspot butterfly is a butterfly in the checkerspot subfamily (*Melitaeinae*) of the brushfooted butterfly family (*Nymphalidae*) that occurs in Riverside and San Diego Counties and the northern areas of Baja California Norte, Mexico. This species occurs in patchy scrubland habitats characterized by mosaics of open areas and dense patches of shrubs.⁵⁷ Host plants required by quino checkerspot larvae for food sources include *Plantago erecta*, *Plantago patagonica*, *Anterrhinum coulterianum*, and *Collinsia concolor* (USFWS 2003). Although quino checkerspot butterfly historically ranged throughout much of non-montane southern California, this species has been extirpated from more than 75 % of its former range. Due to dramatic declines resulting primarily from habitat loss, degradation, and fragmentation, the USFWS listed the quino checkerspot butterfly as endangered on January 16, 1997, and the

⁵⁵ U.S. Fish and Wildlife Service (USFWS). 2009e. Unarmored threespine stickleback (*Gasterosteus aculeatus williamsoni*) 5-year Review: Summary and Evaluation. Ventura Fish and Wildlife Office, Ventura, California. 37 pp.

⁵⁷ U.S. Fish and Wildlife Service (USFWS). National Wetlands Inventory. Available at: <http://wetlands.fws.gov>. (Accessed: April 3, 2023).

USFWS issued an incidental take permit for this species to the Riverside County Habitat Conservation Agency under the Multiple Species Habitat Conservation Plan (MSHCP) on June 22, 2004.

Suitable Habitat Locations in Program Area:

- None

Bald Eagle – Delisted (Federal) / Endangered (State)

The bald eagle (BAEA) was a Federally listed species until 2007 when it was delisted because of the increase in population. However, it remains a State listed endangered species and is covered under the MBTA of 1918, as well as the Bald and Golden Eagle Protection Act of 1940, as amended in 1962. BAEA are distinguished by a white head and white tail feathers, are powerful, brown birds that may weigh 14 pounds and have a wingspan of eight feet. Male eagles are smaller, weighing as much as 10 pounds and have a wingspan of six feet. Sometimes confused with Golden Eagles, BAEA are mostly dark brown until they are four to five years old and acquire their characteristic coloring. They live near rivers, lakes, and marshes where they can find fish, their staple food. BAEA will also feed on waterfowl, turtles, rabbits, snakes, and other small animals and carrion. BAEA require a good food base, perching areas, and nesting sites. Their habitat includes estuaries, large lakes, reservoirs, rivers, and some seacoasts.⁵⁸ In winter, the birds congregate near open water in tall trees for spotting prey and night roosts for sheltering.⁵⁹ They mate for life, choosing the tops of large trees to build nests, which they typically use and enlarge each year. In most of California, the breeding season lasts from about January through July or August. Nests may reach 10 feet across and weigh a half ton. They may also have one or more alternate nests within their breeding territory. The young eagles are flying within three months and are on their own about a month later.

Perches in the immediate vicinity of lakeshores form an essential habitat requirement for BAEA in the Big Bear Valley and the major threat to the continued existence of wintering BAEA in this area comes from development and modification of habitat near the shoreline.⁶⁰

Suitable Habitat Locations in Program Area:

- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Pipeline Alignment Option

Southern Rubber Boa – Threatened (State)

The State listed as threatened southern rubber boa (rubber boa) is a small, rather stout-bodied snake with smooth scales and a blunt head and tail.⁶¹ Adults grow to about 49.5-55.9 centimeters (19.5 to 22 inches) in length. Adult rubber boas are light brown or tan in dorsal color with an unmarked yellow venter; juveniles are pale without a distinct margin between dorsal and ventral coloration. Rubber boas are primarily fossorial and are rarely encountered on the surface, except on days and nights of high humidity and overcast sky. During warm months, this snake is typically

⁶¹ Stewart, Glenn R., Jennings, Mark R., and Goodman Jr., Robert H. 2005. Sensitive Species of Snakes, Frogs, and Salamanders in Southern California Conifer Forest Areas: Status and Management. USDA Forest Service Gen. Tech. Rep. PSW-GTR-195. 2005.

active at night and on overcast days. Rubber boas hibernate during the winter, usually in crevices in rocky outcrops. Other potential hibernacula for this species may include rotting stumps.

Typical southern rubber boa habitat is mixed conifer-oak forest or woodland dominated by two or more of the following species: Jeffrey pine (*Pinus jeffreyi*), yellow pine (*P. ponderosa*), sugar pine (*P. lambertiana*), incense cedar (*Calocedrus decurrens*), white fir (*Abies concolor*), and black oak (*Quercus kelloggii*). Rubber boas are usually found near streams or wet meadows or within or under surface objects with good moisture retaining properties such as rotting logs. Much of the literature suggests that the rubber boa prefers moist conifer-oak forests and woodlands between 5,000 and 8,000 feet in elevation, especially in canyons and on cool, north facing slopes. However, the factors of overriding importance seem to be access to hibernation sites below the frost line and access to damp soil.⁶² In all habitat types, rock outcrops and surface materials (i.e., rocks, logs, and a well-developed duff layer) are important habitat components because they provide cover and maintain soil moisture.⁶³

Suitable Habitat Locations in Program Area:

- Shay Pond Replacement Pipeline
- Sand Canyon Recharge Conveyance Pipeline
- Sand Canyon Conveyance Pipeline Discharge Outlet

California Spotted Owl – SSC

The California spotted owl (SPOW) is considered an SSC by the CDFW and is listed as a Sensitive Species by the U.S. Forest Service (USFS). The SPOW breeds and roosts in forests and woodlands with large old trees and snags, high basal areas of trees and snags, dense canopies (≥70% canopy closure), multiple canopy layers, and downed woody debris. Large, old trees are the key component; they provide nest sites and cover from inclement weather and add structure to the forest canopy and woody debris to the forest floor. These characteristics typify old-growth or late-seral-stage habitats.⁶⁴ Because the SPOW selects stands that have higher structural diversity and significantly more large trees than those generally available, it is considered a habitat specialist. In southern California, SPOW principally occupy montane hardwood and montane hardwood-conifer forests, especially those with canyon live oak (*Quercus chrysolepis*) and bigcone Douglas-fir (*Pseudotsuga macrocarpa*), at mid to high elevations.

SPOW prey on small mammals, particularly dusky-footed woodrats (*Neotoma fuscipes*) at lower elevations (oak woodlands and riparian forests) and throughout southern California. The SPOW breeding season occurs from early spring to late summer or fall. Breeding spotted owls begin pre-laying behaviors, such as preening and roosting together, in February or March and juvenile owl dispersal likely occurs in September and October. The SPOW does not build its own nest but depends on finding suitable, naturally occurring sites in tree cavities or on broken-topped trees or snags, on abandoned raptor or common raven (*Corvus corax*) nests, squirrel nests, dwarf mistletoe (*Arceuthobium spp.*) brooms, or debris accumulations in trees. In the San Bernardino

⁶³ Stewart, Glenn R. 1988. The rubber boa (*Charina bottae*) in California, with particular reference to the southern subspecies, *C. b. umbratica*. In: De Lisle, H. F.; Brown, P. R.; Kaufman, B.; McGurty, B.M., editors. Proceedings of the conference on California herpetology. Southwestern Herpetologists Society, Special Publication (4); 131-138.

⁶⁴ Davis, J., and Gould Jr., G. 2008. California Spotted Owl (*Strix occidentalis occidentalis*). In W.D. Shuford and T. Gardali (Eds.), *California Bird Species of Special Concern: A ranked assessment of species, subspecies, and distinct populations of birds of immediate conservation concern in California*. Studies of Western Birds 1. Western Field Ornithologists, Camarillo, California, and California Department of Fish and Game, Sacramento

Mountains, platform nests predominate (59%) and were in trees with an average diameter at breast height (dbh) of 75 centimeters, whereas cavity nest trees and broken-top nest trees were significantly larger (mean dbh of 108.3 centimeters and 122.3 centimeters, respectively).⁶⁵

According to LaHaye and Gutierrez (2005), urbanization in the form of primary and vacation homes has degraded or consumed some forest in most mountain ranges. The results of spotted owl surveys conducted between 1987 and 1998 in the San Bernardino Mountains indicated that a large area of potentially suitable spotted owl habitat, enough to support 10-15 pairs, existed between Running Springs and Crestline. However, only four pairs have been found in this area, and owls were found only in undeveloped sites. Thus, residential development within montane forests may preclude spotted owl occupancy, even when closed-canopy forest remains on developed sites.

Suitable Habitat Locations in Program Area:

- None

San Bernardino Flying Squirrel – SSC

The San Bernardino flying squirrel (flying squirrel) is considered an SSC by the CDFW and is listed as a Sensitive Species by the USFS. The flying squirrel is a nocturnally active, arboreal squirrel that is distinguished by the furred membranes extending from wrist to ankle that allow squirrels to glide through the air between trees at distances up to 91 meters (300 feet). The San Bernardino flying squirrel is the most southerly distributed subspecies of northern flying squirrel (*Glaucomys sabrinus*) and is paler in color and smaller than most other northern flying squirrel subspecies. It inhabits high-elevation mixed conifer forests comprised of white fir, Jeffrey pine, and black oak between ~4,000 to 8,500 feet. It has specific habitat requirements that include associations with mature forests, large trees, and snags, closed canopy, downed woody debris, and riparian areas, and it is sensitive to habitat fragmentation. It specializes in eating truffles (e.g. *hypogeous mycorrhizal sporocarps*) buried in the forest floor as well as arboreal lichens in winter when truffles are covered with snow and unavailable. This flying squirrel historically occurred as three isolated populations in the San Gabriel, San Bernardino, and San Jacinto Mountain forests.

Flying squirrel populations are adversely affected by habitat fragmentation. Rosenberg and Raphael (1984)⁶⁶ found that in northwestern California, the abundance of squirrels increased with stand size, they were generally absent in stands smaller than 20 hectares (ha), and approximately 75% of stands over 100 ha had flying squirrels. An additional problem with fragmented habitats is the constraints that open spaces pose to the movements of individuals and the colonization of unoccupied habitat patches. Mowrey and Zasada (1982) reported an average gliding distance of about 20 meters in *sabrinus*, with a maximum of 48 meters, and concluded that movements are unimpeded in areas with average openings of 20 meters and occasional openings of 30 to 40 meters.⁶⁷

Suitable Habitat Locations in Program Area:

- Sand Canyon Recharge Conveyance Pipeline
- Sand Canyon Conveyance Pipeline Discharge Outlet
- East Neighborhoods Pipeline Alignment Option
- West Neighborhoods Pipeline Alignment Option
- North Airport Corridor Pipeline Alignment Option
- Meadow Lane Pipeline Alignment Option

Special-Status Habitat with Potential for Occurrence in the Program Area

Several special status habitats have been documented in the Program vicinity (within approximately three miles) including pebble plains, southern California threespine stickleback stream, and USFWS designated Critical Habitat for several Federally listed threatened or endangered species. There is no pebble plain or pebble plain-like habitat within the proposed Program Area footprint. There is southern California threespine stickleback stream habitat within the Shay Pond Conveyance Pipeline alignment and possible Shay Pond Replacement Pipeline.

The nearest USFWS designated Critical Habitat units are adjacent the east side of the BBARWA WWTP and adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option, respectively. The Critical Habitat unit adjacent the east side of the BBARWA WWTP site consists of the North Shay Meadow USFWS designated Critical Habitat unit (Unit 6) for the Federally listed as endangered California dandelion. The Critical Habitat unit adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option consists of the Pan Hot Springs Meadow USFWS designated Critical Habitat unit (Unit 1) for the Federally listed as endangered San Bernardino blue grass and California dandelion.

For further information regarding flora and fauna that may have a potential to occur in the Big Bear Valley area, please refer to Appendix A, Special Status Species Occurrence Potential Analysis found in the BRA (**Appendix 19**).

4.5.4 Regulatory Setting

The proposed Program would be required to comply with the following Federal and State regulations and laws:

1. Compliance with NEPA and State CEQA Guidelines regarding sensitive biological resources
2. USACE Clean Water Act (CWA) Section 404 Permit
3. EPA 404 (b)1 Alternatives Analysis
4. Section 7 and/or 10 of FESA of 1973, as amended
5. MBTA
6. U.S. Bald Eagle Act
7. CESA
8. CDFW Streambed Alteration Agreement, (Section 1600 et seq. of the FGC)
9. State of California Native Plant Protection Act
10. Plant Protection and Management Ordinances (San Bernardino County Code Title 8, Div. 11)

4.5.4.1 Federal

Federal Endangered Species Act

FESA (1973) protects plants and wildlife that are listed by the USFWS and the National Marine Fisheries Service (NMFS) as endangered or threatened. Section 9 of FESA prohibits the taking of endangered wildlife, where taking is defined as any effort to “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct” (50 CFR 17.3). For plants, this statute governs removing, possessing, maliciously damaging, or destroying any endangered plant on federal land and removing, cutting, digging up, damaging, or destroying any endangered plant on non-federal land in knowing violation of state law (16 U.S. Code [U.S.C.] 1538). Under Section 7 of FESA, Federal agencies are required to consult with the USFWS if their actions, including permit approvals or funding, could adversely affect an endangered species (including plants) or its critical habitat. Through consultation and the issuance of a BO, the USFWS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity, provided the action will not jeopardize the continued existence of the species. FESA specifies that the USFWS designate habitat for a species at the time of its listing in which are found the physical or biological features “essential to the conservation of the species,” or which may require “special management consideration or protection...” (16 U.S.C § 1533[a][3].2; 16 U.S.C. § 1532[a]). This designated Critical Habitat is then afforded the same protection under the FESA as individuals of the species itself, requiring issuance of an incidental take permit prior to any activity that results in “the destruction or adverse modification of habitat determined to be critical” (16 U.S.C § 1536[a][2]).

Interagency Consultation and Biological Assessments

Section 7 of FESA provides a means for authorizing the “take” of threatened or endangered species by Federal agencies, and applies to actions that are conducted, permitted, or funded by a Federal agency. The statute requires Federal agencies to consult with the USFWS or NMFS, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. If a proposed project “may affect” a listed species or destroy or modify critical habitat, the Lead Agency is required to prepare a biological assessment evaluating the nature and severity of the potential effect.

Habitat Conservation Plans, Section 10 of FESA, requires the acquisition of an incidental take permit from the USFWS by non-Federal landowners for activities that might incidentally harm (or “take”) endangered or threatened wildlife on their land. To obtain an Incidental Take Permit, an applicant must develop a Habitat Conservation Plan that is designed to offset any harmful impacts the proposed activity might have on the species.

The Migratory Bird Treaty Act of 1918

The MBTA of 1918 (16 U.S.C. 703-711) makes it unlawful to possess, buy, sell, purchase, barter or “take” any migratory bird listed in Title 50 of CFR Part 10. “Take” is defined as possession or destruction of migratory birds, their nests or eggs. Disturbances that cause nest abandonment and/or loss of reproductive effort or the loss of habitats upon which these birds depend may be a violation of the MTBA.

Clean Water Act Section 404

Wetlands are generally considered to be areas that are periodically or permanently inundated by surface or ground water, and support vegetation adapted to life in saturated soil. Wetlands are recognized as important features on a regional and national level due to their high inherent value to fish and wildlife, use as storage areas for storm and floodwaters, and water recharge, filtration,

and purification functions. Technical standards for delineating wetlands have been developed by the USACE which generally defines wetlands through consideration of three criteria: hydrology, soils, and vegetation. Under Section 404 of the CWA, the USACE is responsible for regulating the discharge of dredged or fill material into waters of the U.S. The term “waters” includes certain wetlands and non-wetland bodies of water that meet specific criteria as defined in the CFR and by federal case law.

Currently the applicability of the CWA in accordance with the “2023 Waters Rule” and must be harmonized with the Supreme Court of the U.S. (SCOTUS) rulings in *United States v. Riverside Bayview (Bayview)*⁶⁸, *Solid Waste Agency of Northern Cook County v. Army Corps (SWANCC)*⁶⁹, *Rapanos v. United States (Rapanos)*⁷⁰, and *Sackett v. EPA (Sackett II)*⁷¹ rulings.

The following summarizes the changes that may occur as a result of this ruling. The 2023 Rule defines the following Waters of the U.S. There are no changes from the Pre-2015 Waters Rule in the definitions of a(1), a(2), and a(4) Waters. However, there are nuance changes to a(3) Waters, and there are substantial changes to identifying a(5) Waters. In general, the 2023 Rule does not consider “isolated” as described in SWANCC, nor does it consider a need to have ties to interstate commerce (Bayview). This rule relies entirely on the definitions below for Traditionally Navigable Waters, and their impoundment and tributaries, which are established by having a “Significant Nexus” by contributing to the biological, chemical, or physical characteristics of a Traditionally Navigable Water.

During the first two months of the 2023 Rule implementation, several court cases have enjoined the use of the rule and subsequently have reverted to the Pre-2015 Rule. Currently 27 states are using the Pre-2015 Rule. However, California has not been enjoined and continues to fall under the 2023 Rule. On May 26, 2023 the SCOTUS ruled on Sackett II. In this ruling they found the CWA’s use of “waters” encompasses “only those relatively permanent, standing or continuously flowing bodies of water ‘forming geographic[al] features’ that are described in ordinary parlance as ‘streams, oceans, rivers, and lakes.’” 547 U. S., at 739 (quoting Webster’s New International Dictionary 2882 (2d ed. 1954) (Webster’s Second); original alterations omitted).

The SCOTUS appears to have struck down the use of the Significant Nexus Analysis, use of “Similarly Situated Waters” being combined to have a biological, chemical, or biological nexus to a Traditionally Navigable Water. Further, the Court has determined that Waters of the U.S. extend only to tributaries of traditionally navigable waters that have relatively permanent flows, such that they flow or are inundated unless there is unusually prolonged drought, or the ebb of a tide.

The USACE and EPA will continue to implement the Water of the U.S. Rule under these revised definitions, which may affect the applicability of USACE issued permits for elements of the Program and other projects. The EPA and the USACE will determine CWA jurisdiction over a project site and complete the “significant nexus test” as detailed in the guidelines and the USACE-approved Jurisdictional Determination Form.

Rivers and Harbors Act 1899

Section 10 of the Rivers and Harbors Act of 1899 requires authorization from the USACE for the construction of any structure in or over any navigable waters of the U.S.

⁶⁸ *United States v. Riverside Bayview Homes, Inc.* (1985) 474 U.S. 121.

⁶⁹ *Solid Waste Agency of Northern Cook Cty. v. Army Corps of Engineers* (2001) 531 U.S. 159.

⁷⁰ *Rapanos v. United States* (2006) 547 U.S. 715.

⁷¹ *Sackett v. Environmental Protection Agency* (2023) 598 U.S. _____

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act (16 U.S.C. Sections 661 to 667e et seq.) applies to any Federal project where any body of water is impounded, diverted, deepened, or otherwise modified. Implementing agencies are required to consult with the USFWS and the appropriate state wildlife agency.

Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (16 U.S.C. Section 1801 et seq.) requires all Federal agencies to consult with the NMFS on all actions or proposed actions (permitted, funded, or undertaken by the agency) that may adversely affect fish habitats. It also requires cooperation among NMFS, the councils, fishing participants, and Federal and State agencies to protect, conserve, and enhance essential fish habitat, which is defined as those waters and substrates needed by fish for spawning, breeding, feeding, and growth to maturity.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (The Eagle Act) (1940), amended in 1962, was originally implemented for the protection of bald eagles (*Haliaeetus leucocephalus*). In 1962, Congress amended The Eagle Act to cover golden eagles (*Aquila chrysaetos*), a move that was partially an attempt to strengthen protection of bald eagles, since the latter were often killed by people mistaking them for golden eagles. This Act makes it illegal to import, export, take (molest or disturb), sell, purchase, or barter any bald eagle or golden eagle or part thereof. The golden eagle, however, is accorded somewhat lighter protection under The Eagle Act than that of the bald eagle.

Executive Orders

Invasive Species—Executive Order (EO) 13112 (1999)

Issued on February 3, 1999, promotes the prevention and introduction of invasive species and provides for their control and minimizes the economic, ecological, and human health impacts that invasive species cause through the creation of the Invasive Species Council and Invasive Species Management Plan.

Protection of Wetlands—Executive Order 11990 (1977)

Issued on May 24, 1977, helps avoid the long-term and short-term adverse impacts associated with destroying or modifying wetlands and avoiding direct or indirect support of new construction in wetlands when there is a practicable alternative.

Migratory Bird—EO 13186 (2001)

Issued on January 10, 2001, promotes the conservation of migratory birds and their habitats and directs Federal agencies to implement the MBTA. Protection and Enhancement of Environmental Quality—EO 11514 (1970a), issued on March 5, 1970, supports the purpose and policies of NEPA and directs Federal agencies to take measures to meet national environmental goals.

Migratory Bird Treaty Reform Act

The Migratory Bird Treaty Reform Act (Division E, Title I, Section 143 of the Consolidated Appropriations Act, 2005, PL 108–447) amends the MBTA (16 U.S.C. Sections 703 to 712) such that nonnative birds or birds that have been introduced by humans to the U.S. or its territories are excluded from protection under the Act. It defines a native migratory bird as a species present in the U.S. and its territories as a result of natural biological or ecological

processes. This list excluded two additional species commonly observed in the U.S., the rock pigeon (*Columba livia*) and domestic goose (*Anser domesticus*).

4.5.4.2 State

California Endangered Species Act

California Endangered Species Act (CESA) is similar to the main provisions of FESA and is administered by CDFW. Unlike its Federal counterpart, CESA applies the take prohibitions to not only listed threatened and endangered species, but also to State candidate species for listing. Section 86 of the FGC defines "take" as "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill." The CDFW maintains lists for Candidate-Endangered Species and Candidate-Threatened Species, which have the same protection as listed species. Under CESA the term "endangered species" is defined as a species of plant, fish, or wildlife, which is "in serious danger of becoming extinct throughout all, or a significant portion of its range" and is limited to species or subspecies native to California.

Clean Water Act Section 401/Porter-Cologne Act

California regulates water quality related to discharge of dredge or fill material into waters of the State pursuant to the Porter-Cologne Water Quality Control Act (Porter-Cologne Act) and, when involving waters of the U.S., under its authority pursuant to Section 401 of the CWA. Section 401 compliance is a Federal mandate regulated by the State. The local RWQCB have jurisdiction over all those areas defined as jurisdictional under Section 404 of the CWA. In addition, the RWQCBs regulate water quality for all waters of the State, which may also include isolated wetlands, as defined by the Porter-Cologne Act (Porter Cologne; Ca. Water Code, Div. 7, Section 13000 et seq.). The RWQCB regulates discharges that can affect water quality of both waters of the U.S. and waters of the State. If there is no USACE jurisdiction over waters of the U.S., then the RWQCB regulates water quality of waters of the State through a Waste Discharge Permit, as required to comply with the Porter-Cologne Act when a Section 401 water quality certification would not apply.

Sections 1600 through 1606 of the California Fish and Game Code

This section requires that a Streambed Alteration Application be submitted to the CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." The CDFW reviews the proposed actions and, if necessary, submits to the applicant a proposal for measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the applicant is the Streambed Alteration Agreement. Often, projects that require a Streambed Alteration Agreement also require a permit from the USACE under Section 404 of the CWA. In these instances, the conditions of the Section 404 permit and the Streambed Alteration Agreement may overlap.

California Fish and Game Codes

All birds, and raptors specifically, and their nests, eggs and parts thereof are protected under Sections 3503.5 of the FGC. Disturbance that causes nest abandonment and/or loss of reproductive effort (e.g., killing or abandonment of eggs or young) is considered a violation of this code. Additionally, Section 3513 of the FGC prohibits the take or possession of any migratory non-game bird listed by the MBTA. The CDFW has jurisdiction over the conservation, protection, and management of wildlife, native plants, and habitat necessary to maintain biologically sustainable populations (California Fish & Game Code Section 1802). The CDFW, as a trustee agency under State CEQA Guidelines Section 15386, provides expertise in reviewing and commenting on environmental documents and makes and regulates protocols regarding potential negative impacts to biological resources held in California.

Fully Protected Species

Four sections of the FGC list 37 fully protected species (i.e., Sections 3511, 4700, 5050, and 5515). These sections prohibit take or possession "at any time" of the species listed, with few exceptions, and state that "no provision of this code or any other law will be construed to authorize the issuance of permits or licenses to 'take' the species," and that no previously issued permits or licenses for take of the species "shall have any force or effect" for authorizing take or possession.

Bird Nesting Protections

Bird nesting protections in Sections 3503, 3503.5, 3511, and 3513 of the FGC include the following:

- Section 3503 prohibits the take, possession, or needless destruction of the nest or eggs of any bird.
- Section 3503.5 prohibits the take, possession, or needless destruction of any nests, eggs, or birds in the orders Falconiformes (new world vultures, hawks, eagles, ospreys, and falcons, among others), or Strigiformes (owls).
- Section 3511 prohibits the take or possession of fully protected birds.
- Section 3513 prohibits the take or possession of any migratory nongame bird or part thereof, as designated in the MBTA. To avoid violation of the take provisions, it is generally required that project-related disturbance at active nesting territories be reduced or eliminated during the nesting cycle.

California Migratory Bird Act-Assembly Bill 454

Existing Federal law, the MBTA, provides for the protection of migratory birds, as specified. The MBTA also authorizes states and territories of the U.S. to make and enforce laws or regulations that give further protection to migratory birds, their nests, and eggs. Existing State law makes unlawful the taking or possession of any migratory nongame bird, or part of any migratory nongame bird, as designated in the MBTA, except as provided by rules and regulations adopted by the U.S. Secretary of the Interior under provisions of the MBTA..... (a) It is unlawful to take or possess any migratory nongame bird as designated in the MBTA (16 U.S.C. Sec. 703 et seq.), or any part of a migratory nongame bird described in this section, except as provided by rules and regulations adopted by the U.S. Secretary of the Interior under the MBTA.

Native Plant Protection Act

The Native Plant Protect Act (NPPA) (1977) (FGC Sections 1900-1913) was created with the intent to "preserve, protect, and enhance rare and endangered plants in this State." The NPPA is administered by CDFW. The Fish and Game Commission has the authority to designate native plants as endangered or rare and to protect endangered and rare plants from take. CESA, discussed above at 4.5.4.2.1, provides further protection for rare and endangered plant species, but the NPPA remains part of the FGC.

Natural Communities Conservation Planning Act

This Act was enacted to encourage broad-based planning to provide for effective protection and conservation of the state's wildlife resources while continuing to allow appropriate development and growth (FGC Sections 2800 to 2835). Natural Community Conservation Plans (NCCP) may be implemented, which identify measures necessary to conserve and manage natural biological diversity within the planning area, while allowing compatible and appropriate economic development, growth, and other human uses.

Senate Concurrent Resolution No. 17 – Oak Woodlands

State Senate Concurrent Resolution No. 17 is legislation that requests State agencies having land use planning duties and responsibilities to assess and determine the effects of their decisions or actions within any oak woodlands containing Blue, Englemann, Valley, or Coast Live Oak. The measure requests those state agencies to preserve and protect native oak woodlands to the maximum extent feasible or provide replacement plantings where designated oak species are removed from oak woodlands. The **MMs**, as described above, will ensure that impacts to oak woodlands are less than significant.

4.5.4.5 Local

San Bernardino County Development Code

The following provisions from the San Bernardino County Development Code help minimize biological resources impacts associated with new development projects and are relevant to the proposed Program.

Chapter 88.01 (Plant Protection and Management). This chapter provides regulatory and management guidance for plant resources in unincorporated areas as well as mixed public and private lands. It primarily addresses tree and vegetation removal in public land and private land in unincorporated areas.

Section 88.01.050(f)(1[a]), The location of the regulated tree or plant and/or its dripline interferes with an allowed structure, sewage disposal area, paved area, or other approved improvement or ground disturbing activity and there is no other alternative feasible location for the improvement.

Section 88.01.070, Mountain Forest and Valley Tree Conservation. This section conserves forest resources in the Mountain and Valley regions to supplement the Z'berg-Nejedly Forest Practice Act of 1973 (California Public Resources Code, § 4526 et seq.). It regulates private and commercial harvesting of trees on public and private land.

Section 88.01.080, Riparian Plant Conservation. This section addresses the health of riparian corridors, their impact on waterways within the region, their use as habitat by various plant and wildlife species, and their stabilization of stream banks.

Chapter 88.02, Soil and Water Conservation. This chapter promotes the health of soil communities to limit soil erosion potential and preserve air quality. This code primarily regulates ground-disturbing activities.

San Bernardino Countywide Plan

The San Bernardino Countywide Plan offers goals and policies related to the protection of biological resources. These goals and policies are found in the Natural Resources Element and Land Use Element.

Natural Resources Element

The Countywide Plan Natural Resources Element has the following goal and policies that relate to biological resources, including:

Goal	NR-5	An interconnected landscape of open spaces and habitat areas that promotes biodiversity and healthy ecosystems, both for their intrinsic value and for the value placed on them by residents and visitors.
-------------	-------------	--

Policy	NR-5.1	Coordinated habitat planning. We participate in landscape-scale habitat conservation planning and coordinate with existing or proposed habitat conservation and natural resource management plans for private and public lands to increase certainty for both the conservation of species, habitats, wildlife corridors, and other important biological resources and functions; and for land development and infrastructure permitting.
	NR-5.2	Capacity for resource protection and management. We coordinate with public and nongovernmental agencies to seek funding and other resources to protect, restore, and maintain open space, habitat, and wildlife corridors for threatened, endangered, and other sensitive species.
	NR-5.3	Multiple-resource benefits. We prioritize conservation actions that demonstrate multiple resource preservation benefits, such as biology, climate change adaptation and resiliency, hydrology, cultural, scenic, and community character.
	NR-5.8	Invasive species. We require the use of non-invasive plant species with new development and encourage the management of existing invasive plant species that degrade ecological function.
	NR-5.2	Capacity for resource protection and management. We coordinate with public and nongovernmental agencies to seek funding and other resources to protect, restore, and maintain open space, habitat, and wildlife corridors for threatened, endangered, and other sensitive species.
	NR-5.2	Capacity for resource protection and management. We coordinate with public and nongovernmental agencies to seek funding and other resources to protect, restore, and maintain open space, habitat, and wildlife corridors for threatened, endangered, and other sensitive species.

City of Big Bear Lake General Plan

The City of Big Bear Lake General Plan Environmental Resources Element has the following goal and policies that relate to biological resources, including:

Goal	ER-1	Identification of significant biological resources within the planning area and mitigation of impacts to these resources from urban development, in balance with other needs of the community and with special consideration given to preservation of listed endangered species in conformance with federal and state laws.
Policy	ER-1.1	The City shall act to reasonably conserve habitat of special-status wildlife and native plant species as environmental, economic and aesthetic assets of the community.
	ER-1.3	The City shall proactively assist in regional efforts to maintain the ecological integrity of Big Bear Lake.
	ER-1.4	Collect available data on biological resources within the planning area to maintain an accurate and regularly updated map and information base on sensitive plant and animal species and habitat occurring in the planning area.
	ER-1.5	Encourage the maintenance of natural drainage channels in a manner which allows passage of wildlife and, if appropriate, the establishment of nature trails, while ensuring that these channels can accommodate flows adequately to meet flood control objective.

City of Big Bear Lake Municipal Code

Chapter 17.10 Tree Conservations and Defensible Space. The City of Big Bear Lake’s Municipal Code Chapter 17.10, Tree Conservation and Defensible Spaces stipulates development requirements for projects that would remove existing trees of 12” in diameter at breast height.

1995 Water Quality Control Plan for the Santa Ana River Basin Plan (Basin Plan) as Amended in 2008, 2011, 2016, and 2019

Table 3-2 (extracted from the Chapter 3, Program Description, shows the designated beneficial uses of Big Bear Lake and Stanfield Marsh per the 1995 Water Quality Control Plan (WQCP) for the Santa Ana Basin Plan, as amended in 2008, 2011, 2016, and 2019.

**Table 3-2
 BENEFICIAL USES OF BIG BEAR LAKE AND STANFIELD MARSH**

Beneficial Uses	Big Bear Lake	Stanfield Marsh
AGR - Agricultural Supply	✓	
COLD - Cold Freshwater Habitat	✓	✓
COMM – Commercial and Sportfishing	✓	
GWR - Groundwater Recharge	✓	
MUN - Municipal and Domestic Supply	✓	✓
RARE - Rare, Threatened, or Endangered Species	✓	✓
REC1 - Water Contact Recreation	✓	✓
REC2 - Non-Contact Water Recreation	✓	✓
SPWN - Spawning, Reproduction, and/or Early Development	✓	
WARM - Warm Freshwater Habitat	✓	
WILD - Wildlife Habitat	✓	✓

Other Local Policies and Ordinances

The local policies and ordinances pertaining to and protecting biological resources include the following:

- The City of Big Bear Lake’s Municipal Code Chapter 17.10, Tree Conservation and Defensible Spaces stipulates development requirements for projects that would remove existing trees of 12” in diameter at breast height.
- San Bernardino County Development Code⁷² Plant Protection and Management (88.01), which requires a Tree Removal Permit in conjunction with the land use application or development permit. Where such applications or approvals are required, a Tree Removal Permit pursuant to San Bernardino County’s Development Code would be required. The San Bernardino County Development Code stipulates the following for the Mountain Region that would be applicable to the activities proposed under the proposed Program: 88.01.050(f)(1[a]), *The location of the regulated tree or plant and/or its dripline interferes with an allowed structure, sewage disposal area, paved area, or other approved improvement or ground disturbing activity and there is no other alternative feasible location for the improvement.*

⁷² San Bernardino County, 2023. Development Code. <https://lus.sbcounty.gov/planning-home/development-code/> (accessed 09/14/23)

- CAL FIRE stipulates that when a project will convert timberland to a use other than growing timber a TCP is required [California Public Resources Code 4621(a)].
- When projects are converting timberland to another use, the operations are considered commercial timber operations even if the logs are not being sold [California Public Resources Code 4527(a)(1) and (2)]. As such, in addition to the TCP, a THP is required for the removal of the timber [California Public Resources Code 4581].

4.5.5 Thresholds of Significance

The criteria used to determine the significance of potential Program-related biological resource impacts are taken from the Initial Study Checklist in Appendix G of the State CEQA Guidelines (14 California Code of Regulations §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to biological resources if it would:

- a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
- b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?
- c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?
- d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
- e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
- f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The potential biological changes in the environment are addressed in response to the above thresholds in the following analysis.

4.5.5.1 Methodology

Biological Resources Assessment

Data regarding biological resources in the Program Area were obtained through literature review and field investigation. Prior to performing the surveys, available databases, and documentation relevant to the Program Area were reviewed for documented occurrences of special status species in the Program vicinity (within approximately three miles). The USFWS threatened and endangered species occurrence data overlay, USFWS IPaC, and the most recent versions of the CNDDB (*Rarefind 5*) and CNPSEI databases were searched for special status species data in the *Big Bear Lake*, *Big Bear City*, *Fawnskin* and *Moonridge* USGS 7.5-Minute Series Quadrangles (Appendix F of the BRA). These databases contain records of reported occurrences of State and Federally listed species or otherwise sensitive species and habitats that may occur within the vicinity of the proposed Program Area footprint (within approximately three miles). Other available technical information on the biological resources of the area was also reviewed including previous surveys and recent findings.

Biological Resources Assessment Field Survey

Jacobs's biologist Daniel Smith conducted a biological resources assessment of the Program Area in June and July of 2022 and made a follow-up survey visit in July of 2023. Much of the Program is expected to be restricted to existing paved roadways and developed WWTP site. However, several Program components would impact areas that have not previously been developed including:

- The "Baldwin Lake Pipeline Alignment Option" of the Stanfield Marsh conveyance pipeline from the BBARWA WWTP.
- The "North Airport Corridor Pipeline Alignment Option" of the Stanfield Marsh conveyance pipeline from the BBARWA WWTP.
- Approximately 350 LF of the Sand Canyon Recharge Conveyance Pipeline from the existing Resort Storage Pond.
- The Sand Canyon Conveyance Pipeline Discharge Outlet.
- The Shay Pond Discharge Project outlet at Shay Pond.
- The new Solar Evaporation Ponds at the BBARWA WWTP.
- Approximately 2.9 acres of new solar facilities within and adjacent to the WWTP.

Therefore, the reconnaissance-level field survey consisted of a pedestrian survey that encompassed 100% visual coverage of the undeveloped aspects of the Program, as well as the road shoulder along the proposed conveyance pipeline alignments, within the developed neighborhoods. No adjacent private properties were accessed during the survey. The purpose of the survey was to assess the Program Area for its potential to support special status species. Wildlife species were detected during field surveys by sight, calls, tracks, scat, and/or other signs. In addition to species observed, expected wildlife usage of the Program Area was determined based on known habitat preferences of regional wildlife species and knowledge of their relative distribution in the area. The focus of the faunal species survey was to identify potential habitat within and adjacent the proposed Program Area footprint for special status wildlife that may occur in the Program vicinity.

Floristic Botanical Survey

A floristic botanical field survey was also conducted by Jacobs's biologist Daniel Smith in June and July of 2022, a follow-up survey in July of 2023. In accordance with the CDFW's March 20, 2018, *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities*, the survey was conducted during the appropriate time of year, when the target species were both evident and identifiable. The target species consisted of those State and/or Federally listed plant species that have been documented in the Program vicinity (within approximately three miles), whose environmental requirements may be present within the Program Area. Target species included:

- Ash-gray paintbrush (*Castilleja cinerea*)
- Big Bear Valley sandwort (*Eremogone ursina*)
- Southern mountain buckwheat (*Eriogonum kennedyi* var. *austromontanum*)
- Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*)
- San Bernardino Mountains bladderpod (*Physaria kingii* ssp. *bernardina*)
- San Bernardino blue grass (*Poa atropurpurea*)
- Bird-foot checkerbloom (*Sidalcea pedata*)
- California dandelion (*Taraxacum californicum*)
- Slender-petaled thelypodium (*Thelypodium stenopetalum*)

Prior to conducting the survey, Mr. Smith visited multiple reference sites within the Big Bear Valley, where the target species are known to occur, to determine whether the target species

were identifiable at the time of the survey and to obtain a visual image of the target species, associated habitat, and associated natural communities. The reference sites that were visited prior to survey included previously documented occurrences within the Big Bear Valley, near the Aspen Glen Picnic Area (Big Bear Valley sandwort); the Eagle Point Rare Plant Preserve (ash-gray paintbrush, southern mountain buckwheat, bird-foot checkerbloom, California dandelion, and slender-petaled thelypodium); North Baldwin Meadow (San Bernardino blue grass); SBNF land northwest of the North Shore Drive/Division Drive intersection (Cushenbury buckwheat); and SBNF land in the vicinity of Holcomb Valley/Caribou Creek (San Bernardino Mountains bladderpod). All target species were evident and identifiable at the reference sites prior to the 2022 and 2023 survey visits. During the surveys, 100% visual coverage of the of the undeveloped aspects of the Program, as well as the road shoulder along the proposed conveyance pipeline alignments, was achieved by walking the proposed Program Area footprint and road shoulders, within and adjacent where Program related ground disturbance is expected to occur.

Survey Limitations

No private properties were accessed without landowner permission. No focused faunal surveys were conducted, and no small mammal trapping was performed. Approximately 350 LF of the Sand Canyon Recharge Conveyance Pipeline (**Figure 4.5-5**) would be constructed between two houses, which would require an easement. Permission from the property owners of these two private residences was not obtained at the time of survey. Therefore, this section of the Sand Canyon Recharge Conveyance Pipeline was not surveyed. Additionally, it is anticipated that the reuse of the existing pipeline from BBARWA extending almost the entire distance to Shay Pond will be possible. As this existing pipeline alignment is anticipated to be viable, the Shay Pond Replacement Pipeline alignment (**Figures 4.5-7 through 4.5-8**) was not surveyed because the Program Team does not currently anticipate that the installation of this pipeline will be necessary. The existing pipeline from BBARWA extending almost the entire distance to Shay Pond is belowground, and as such, its use would not cause any aboveground impacts that could affect special status species, habitats, jurisdictional features, or other biological resources. BBARWA expects that the existing pipeline that extends from the BBARWA WWTP to Shay Pond, which is presently not in use, will be sufficient to convey purified water from the AWPf at BBARWA's WWTP to the proposed short length of pipeline to Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**). Thus, given that the existing pipeline is anticipated to be sufficient to serve the Shay Pond Discharge Project, the Shay Pond Replacement Pipeline is not anticipated to be necessary and as a result, the Shay Pond Replacement Pipeline alignment was not surveyed. Additional surveys shall be conducted prior to implementation of Program activities within either of these two potential alignments (Shay Pond Replacement Pipeline and Sand Canyon Recharge Conveyance Pipeline on private property), to assess potential Program related impacts to special status species and habitats that may occur in these areas.

Jurisdictional Waters Assessment

In June of 2022 and July of 2023, Mr. Smith also evaluated the Program Area for the presence of riverine/riparian/wetland habitat and jurisdictional waters, i.e., Waters of the U.S., as regulated by the USACE and RWQCB, and/or jurisdictional streambed and associated riparian habitat as regulated by the CDFW. Prior to the field visits, aerial photographs of the Program Area were viewed and compared with the surrounding USGS 7.5-Minute Topographic Quadrangle maps to identify drainage features within the survey area as indicated from topographic changes, blue-line features, or visible drainage patterns. The USFWS National Wetland Inventory and EPA Water Program "My Waters" Google Earth Pro data layer was also reviewed to determine whether any hydrologic features and wetland areas had been documented within the vicinity of the site. Similarly, the USDA NRCS Web Soil Survey was reviewed for soil types found within the Program Area to identify the soil series in the area and to check these soils to determine whether they are

regionally identified as hydric soils. Upstream and downstream connectivity of surface waters (if present) were reviewed on Google Earth Pro aerial photographs and topographic maps to determine jurisdictional status. The lateral extent of potential USACE jurisdiction was measured at the Ordinary High Watermark (OHWM) in accordance with regulations set forth in 33CFR part 328 and the USACE guidance documents listed below:

- *USACE Wetlands Research Program Technical Report Y-87-1 (on-line edition), Wetlands Delineation Manual, Environmental Laboratory, 1987 (Wetland Delineation Manual).*
- *USACE Minimum Standards for Acceptance of Preliminary Wetlands Delineations, November 30, 2001 (Minimum Standards).*
- *USACE Jurisdictional Determination Form Instructional Guidebook, May 30, 2007 (JD Form Guidebook).*
- *USACE Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0), May 2010.*
- *USACE A Guide to Ordinary High-Water Mark (OHWM) Delineation for Non-Perennial Streams in the Western Mountains, Valleys, and Coast Region of the United States, August 2014 (Delineation Manual).*

To be considered a *jurisdictional wetland* under the CWA, Section 404, an area must possess three (3) wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology.

- ▶ **Hydrophytic vegetation:** Hydrophytic vegetation is plant life that grows, and is typically adapted for life, in permanently or periodically saturated soils. The hydrophytic vegetation criterion is met if more than 50 % of the dominant plant species from all strata (tree, shrub, and herb layers) is considered hydrophytic. Hydrophytic species are those included on the 2018 National Wetland Plant Lists for the Arid West Region (USACE 2018). Each species on the lists is rated with a wetland indicator category, as shown in Table 1 (below). To be considered hydrophytic, the species must have *wetland indicator status*, i.e., be rated as Obligate Wetland (OBL), Facultative Wetland (FACW), or Facultative (FAC).

**Table 4.5-2
 WETLAND INDICATOR VEGETATION CATEGORIES**

Category	Probability
Obligate Wetland (OBL)	Almost always occur in wetlands (estimated probability >99%)
Facultative Wetland (FACW)	Usually occur in wetlands (estimated probability 67 to 99%)
Facultative (FAC)	Equally likely to occur in wetlands and non-wetlands (estimated probability 34 to 66%)
Facultative Upland (FACU)	Usually occur in non-wetlands (estimated probability 67 to 99%)
Obligate Upland (UPL)	Almost always occur in non-wetlands (estimated probability >99%)

- ▶ **Hydric Soil:** Soil maps from the USDA NRCS Web Soil Survey (USDA 2021) were reviewed for soil types found within the Program Area. Hydric soils are saturated or inundated long enough during the growing season to develop anaerobic conditions that favor growth and regeneration of hydrophytic vegetation. There are several indirect indicators that may signify the presence of hydric soils including hydrogen sulfide generation, the presence of iron and manganese concretions, certain soil colors, gleying, and the presence of mottling. Generally, hydric soils are dark in color or may be gleyed (bluish, greenish, or grayish), resulting from soil development under anoxic (without oxygen) conditions. Bright mottles within an otherwise dark soil matrix indicate periodic saturation with intervening periods of soil aeration. Hydric indicators are particularly difficult to observe in sandy soils, which are often recently deposited soils of flood plains

(entisols) and usually lack sufficient fines (clay and silt) and organic material to allow use of soil color as a reliable indicator of hydric conditions. Hydric soil indicators in sandy soils include accumulations of organic matter in the surface horizon, vertical streaking of subsurface horizons by organic matter, and organic pans.

The hydric soil criterion is satisfied at a location if soils in the area can be inferred or observed to have a high groundwater table, if there is evidence of prolonged soil saturation, or if there are any indicators suggesting a long-term reducing environment in the upper part of the soil profile. Reducing conditions are most easily assessed using soil color. Soil colors were evaluated using the Munsell Soil Color Charts (Munsell 2000). Soil pits are dug (when necessary) to an approximate depth of 16-20 inches to evaluate soil profiles for indications of anaerobic and redoximorphic (hydric) conditions in the subsurface.

- ▶ ***Wetland Hydrology:*** The wetland hydrology criterion is satisfied at a location based upon conclusions inferred from field observations that indicate an area has a high probability of being inundated or saturated (flooded, ponded, or tidally influenced) long enough during the growing season to develop anaerobic conditions in the surface soil environment, especially the root zone (USACE 1987 and USACE 2008).

Evaluation of CDFW jurisdiction followed guidance in the FGC. Specifically, CDFW jurisdiction would occur where a stream has a definite course with a distinguishable bed and bank showing evidence of where waters rise to their highest level and to the extent of associated riparian vegetation.

4.5.6 Potential Impacts

The following discussion represents an analysis of the impacts from implementing the Program as proposed in Chapter 3, Program Description, in the context of the existing conditions within the Big Bear Valley.

- a) Would the Program have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW or USFWS?**

The construction and operation of the infrastructure across all Program Categories required to support the Program may result in direct and indirect impacts on special-status wildlife species. The extent and nature of impacts on special-status wildlife species varies depending on the species under consideration, their range, and the type and quality of suitable habitats present.

In general, permanent and temporary direct impacts on special-status wildlife species during construction of the future infrastructure improvements across all Program Categories include mortality or injury, and disturbances to suitable habitats for special-status wildlife species, including disruption of wetland and streambeds; water pollution; and reptile, bird, and mammal burrow or nest disturbance. These habitat disturbances could lead to the permanent or temporary abandonment of these habitats by special-status species, a disruption in the life cycle of these species, or direct mortality or injury of individuals of these species.

Permanent and temporary indirect impacts on special-status wildlife species would occur through construction or maintenance activities associated with future Program facilities in a number of ways depending on the species and type of disturbance. Potential indirect impacts include erosion, soil compaction, increased siltation and sedimentation, fractures in the hardpan soils or

rock outcroppings, alteration of jurisdictional water hydrology, dust aerosolization, host plant stress, destruction of native vegetation, habitat fragmentation, and noise and light pollution. These indirect impacts could lead to the disturbance of special-status wildlife species such as a temporary shift in foraging patterns or territories, refugia abandonment, increased predation, decreased reproductive success, and reduced population viability.

Construction of any Program facility should only result in mostly minimal impacts on special-status wildlife species, because only a limited amount of marginal habitat for special-status wildlife species could be impacted by construction activities. The location where most of the proposed Program facilities will be installed or constructed occurs within built-up land, or otherwise disturbed locations (such as BBARWA's WWTP, etc.), and thus construction would potentially impact special-status wildlife species that use mostly urban/developed areas. This does not negate the fact that special-status species, critical habitat, and habitat supporting special status species exists within the Big Bear Valley, and may be impacted by a minimal number and type of facilities proposed as part of the Program, particularly the facilities that would be installed within Baldwin Lake or in more rural, native land areas such as Shay Pond.

Ongoing operations or maintenance activities requiring ground disturbance, clearing, or grubbing could cause erosion and sedimentation, or could indirectly affect the hydrology of nearby jurisdictional waters and the species that depend on these resources. Chemical runoff from trucks or equipment within the future Program facility ROW could indirectly degrade suitable habitat used by these species that are present adjacent to or within the management zone boundaries. If operational maintenance requires weed abatement activities, such as the use of herbicides, these activities could also contribute to chemical runoff and pollution of adjacent suitable habitats. However, maintenance activities that would have potential impacts on special-status wildlife species are limited to the Program ROW areas that are currently in service or that will be added to normal program operations and maintenance at existing facilities.

As biological resource impacts are highly site dependent, the following discussion analyzes the potential impacts on each project site location. These locations are:

- **BBARWA WWTP Upgrades Project**
 - BBARWA WWTP Upgrades
- **Solar Evaporation Ponds Project**
 - Solar Evaporation Ponds at the BBARWA WWTP Site
- **Sand Canyon Recharge Project**
 - Sand Canyon Recharge Conveyance Pipeline
 - Sand Canyon Conveyance Pipeline Discharge Outlet
 - Sand Canyon Booster Station
 - Sand Canyon Monitoring Wells (locations unknown)
- **Shay Pond Discharge Project**
 - Shay Pond Replacement Pipeline
 - Shay Pond Conveyance Pipeline Alignment
- **Stanfield Marsh/Big Bear Lake Discharge Project**
 - Stanfield Marsh Conveyance Pipeline Discharge Outlets
 - Alignment Option 1 to Discharge Point 1
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option

- Alignment Option 2 to Discharge Point 2
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option

BBARWA WWTP Upgrades Project

Ash-gray Paintbrush – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake Pipeline Alignment Option (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable habitat for this species within the proposed Program Area footprint near the western end of the BBARWA WWTP Site, in addition to potential hostplant species (*Artemisia* spp.) that are present in this area as well. However, ash-gray paintbrush was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, ash-gray paintbrush is considered absent from the proposed Program Area footprint at the time of survey and the Program will not affect this species. However, given that there is suitable habitat located in the vicinity of the BBARWA WWTP site, it is possible that the implementation of the facilities at the BBARWA WWTP site could impact this species. Therefore, mitigation is required to ensure that impacts to this species are avoided.

In order to identify the extent of special status species plants within a given Program component, the **MM BIO-2**, which requires preconstruction clearance surveys is necessary to avoid a potentially significant impact on this species.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Impacts would be less than significant through the implementation of mitigation.

San Bernardino Blue Grass – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond Conveyance Pipeline alignment and immediately adjacent the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 2) site, respectively. San Bernardino blue grass was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. No potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Bird-foot Checkerbloom – Endangered (Federal/State)

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the Solar Evaporation Ponds footprint at the BBARWA WWTP (**Figure 4.5-11**). According to the CNDDDB, bird-foot checkerbloom was

also documented within the proposed Baldwin Lake Pipeline Alignment Option in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). There is also suitable montane meadow habitat for this species within the possible Shay Pond Replacement Pipeline, as well as immediately adjacent the Shay Pond Conveyance Pipeline alignment and Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program, but not within the BBARWA WWTP Upgrade footprint, as this portion of the site has been developed with the facilities that support BBARWA's operations. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

California Dandelion – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake Pipeline Alignment Option (2008), near the west end of the alignment, respectively. There is suitable montane meadow habitat for this species within the Baldwin Lake Pipeline Alignment Option, as well as the proposed Solar Evaporation Ponds, immediately adjacent the Shay Pond Conveyance Pipeline alignment, and adjacent the Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program, but not within the BBARWA WWTP Upgrade footprint, as this portion of the site has been developed with the facilities that support BBARWA's operations. However, California dandelion was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Slender-petaled Thelypodium – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake Pipeline Alignment Option (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable montane meadow and big sagebrush habitat for this species within the Baldwin Lake Pipeline Alignment Option, as well as adjacent the Shay Pond Conveyance Pipeline components of the proposed Program, but not within the BBARWA WWTP Upgrade footprint, as this portion of the site has been developed with the facilities that support BBARWA's operations. However, slender-petaled thelypodium was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Unarmored Threespine Stickleback – Endangered (Federal/State)

Findings: Stickleback have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream extent of Shay Creek, but are not located within the BBARWA WWTP Upgrade footprint, as this portion of the site has been developed with the facilities that support BBARWA's operations and does not contain any water features that would support this species. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Bald Eagle – Delisted (Federal) / Endangered (State)

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair (known as Jackie and Shadow) has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately five miles west of the Stanfield Marsh Conveyance Pipeline Discharge Outlet locations.

Big Bear Lake and Baldwin Lake support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Southern Rubber Boa – Threatened (State)

Findings: According to the CNDDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake Pipeline Alignment Option, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). There is some marginally suitable rubber boa habitat throughout the Program Area, however, given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, Southern Rubber Boa are not likely to be affected by the implementation of this Program Component. Thus, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

San Bernardino Flying Squirrel – SSC

Findings: The Flying Squirrels of Southern California is a project of the SDNHM, in collaboration with the USFS and the USFWS, to try to determine the distribution and habitat use of the flying squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon Recharge Conveyance Pipeline, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane Pipeline Alignment Option. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, this species has been documented in residential areas in the Big Bear Valley and elsewhere. However, there is no suitable habitat at the BBARWA WWTP that could support this species, and therefore, no potential impacts to this species from implementation of the BBARWA WWTP Upgrades Project are anticipated.

Cushenbury Milk-vetch – Endangered (Federal)

Findings: According to the CNDDDB, the nearest documented Cushenbury milk-vetch occurrence (2021) is approximately 2.4 miles northeast of the BBARWA WWTP site. This occurrence is located along a ridge between Nelson ridge and Arrastre Creek, on soils derived from carbonate

and quartz monzonite in open pinyon woodland habitat (CNDDDB 2023). There are no documented Cushenbury milk-vetch occurrences in the Big Bear Valley.

The USFWS lists the primary constituent elements (PCEs) for Cushenbury milk-vetch designated Critical Habitat as:

1. Soils derived primarily from the upper and middle members of the Bird Spring Formation and Undivided Cambrian parent materials that occur on dry flats and slopes or along rocky washes with limestone outwash/deposits at elevations between 1,171 and 2,013 meters (3,864 and 6,604 feet).
2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).
3. Associated plant communities that have areas with an open canopy cover and little accumulation of organic material (e.g., leaf litter) on the surface of the soil.

The associated plant communities (PCE 3) and carbonate or limestone substrates (PCE 1) Cushenbury milk-vetch requires do not occur within the proposed Program Area footprint. Furthermore, most of the proposed Program Area footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Additionally, the Program Area is outside the known elevation range for this species, which has not been documented in the Big Bear Valley. Therefore, Cushenbury milk-vetch is presumed absent from the proposed Program Area footprint and the Program will not affect this species. No potential impacts to this species are anticipated.

Big Bear Valley Sandwort – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented Big Bear Valley sandwort occurrences are approximately 0.3 mile west (2021) and 0.5 mile north (1981) of the proposed Shay Pond Conveyance Pipeline alignment, within the Sawmill Pebble Plain Complex. However, there is no pebble plain or pebble plain-like habitat suitable for Big Bear Valley sandwort within the proposed Program Area footprint and this species was not detected during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, Big Bear Valley sandwort is considered absent from the proposed Program Area footprint at the time of survey and the Program will not affect this species. No potential impacts to this species are anticipated.

Parish's Daisy – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented Parish's daisy occurrence (1988) is approximately 1.8 miles northeast of the BBARWA WWTP site. This occurrence is located within a drainage along Nelson ridge, on soils derived from dolomite on carbonaceous rock in open pinyon and Joshua tree dominated woodland habitat (CNDDDB 2023). There are no documented Parish's daisy occurrences in the Big Bear Valley.

The USFWS lists the primary constituent elements (PCEs) for Parish's daisy designated Critical Habitat as:

1. Soils derived primarily from upstream or upslope limestone, dolomite, or quartz monzonite parent materials that occur on dry, rocky hillsides, shallow drainages, or outwash plains at elevations between 1,171 and 1,950 meters (3,842 and 6,400 feet).
2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).
3. Associated plant communities that have areas with an open canopy cover.

The associated plant communities (PCE 3) and limestone, dolomite, or quartz monzonite substrates (PCE 1) Parish's daisy requires do not occur within the proposed Program Area

footprint. Furthermore, most of the proposed Program Area footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Additionally, this species has not been documented in the Big Bear Valley. Therefore, Parish's daisy is presumed absent from the proposed Program Area footprint and the Program will not affect this species. No potential impacts to this species are anticipated.

Southern Mountain Buckwheat – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented southern mountain buckwheat occurrences are approximately 0.3 mile west (2021) and 0.5 mile north (1981) of the proposed Shay Pond Conveyance Pipeline alignment, within the Sawmill Pebble Plain Complex. However, there is no pebble plain or pebble plain-like habitat suitable for southern mountain buckwheat within the proposed Program Area footprint and this species was not detected during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, southern mountain buckwheat is considered absent from the proposed Program Area footprint at the time of survey and the Program will not affect this species. No potential impacts to this species are anticipated.

Cushenbury Buckwheat – Endangered (Federal)

Findings: According to the CNDDDB, the nearest documented Cushenbury buckwheat occurrence (2021) is approximately 0.5 miles northwest of the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 1) site, north of Stanfield Marsh, on limestone marble and dolomitic limestone soils (CNDDDB 2023).

The USFWS lists the primary constituent elements (PCEs) for Cushenbury buckwheat designated Critical Habitat as:

1. Soils derived primarily from the upper and middle members of the Bird Spring Formation and Bonanza King Formation parent materials that occur on hillsides at elevations between 4,600 to 7,900 feet (1,400 to 2,400 meters).
2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).
3. Associated plant communities that have areas with an open canopy cover (generally less than 15 % cover) and little accumulation of organic material (e.g., leaf litter) on the surface of the soil (USFWS 1994).

The associated plant communities (PCE 3) and carbonate or limestone substrates (PCE 1) Cushenbury buckwheat requires do not occur within the proposed Program Area footprint. Furthermore, most of the proposed Program Area footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Therefore, Cushenbury buckwheat is presumed absent from the proposed Program Area footprint and the Program will not affect this species. No potential impacts to this species are anticipated.

San Bernardino Mountains bladderpod – Endangered (Federal)

Findings: According to the CNDDDB, the nearest documented San Bernardino Mountains bladderpod occurrence (2019) is approximately 1,000 feet north of the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 1) site. This occurrence is located in mixed single leaf pinyon, mountain juniper, and white fir forest habitat, on several carbonate hills situated just north of Big Bear Lake and Stanfield Marsh (CNDDDB 2023).

The USFWS lists the primary constituent elements (PCEs) for San Bernardino Mountains bladderpod designated Critical Habitat as:

1. Soils derived primarily from Bonanza King Formation and Undivided Cambrian parent materials that occur on hillsides or on large rock outcrops at elevations between 6,883 and 8,800 feet (2,098 and 2,700 meters).
2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).
3. Associated plant communities that have areas with an open canopy cover and little accumulation of organic material (e.g., leaf litter) on the surface of the soil (USFWS 1994).

The associated plant communities (PCE 3) and limestone or dolomite soils (PCE 1) San Bernardino Mountains bladderpod requires do not occur within the proposed Program Area footprint. Furthermore, most of the proposed Program Area footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Therefore, San Bernardino Mountains bladderpod is presumed absent from the proposed Program Area footprint and the Program will not affect this species. No potential impacts to this species are anticipated.

Quino Checkerspot Butterfly – Endangered (Federal)

Findings: Although there is a single quino checkerspot butterfly historic collection (1969) from approximately 2.7 miles south/southeast of the Shay Pond Conveyance Pipeline, the identity of this specimen is questionable (CNDDDB 2023). Furthermore, there are no other occurrences of this species documented in the Big Bear Valley and this species is considered extirpated in San Bernardino County. Therefore, quino checkerspot butterfly is not likely to occur in the Program Area and the Program will not affect this species. No potential impacts to this species are anticipated.

California Spotted Owl – SSC

Findings: According to the CNDDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately one mile southeast of the Sand Canyon Recharge Conveyance Pipeline. However, the Program Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region. Therefore, SPOW are not likely to occur in the Program Area. However, While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW as a result of light pollution. Therefore, to minimize impacts to this species from light pollution, **MM BIO-12**, which would protect nocturnal species from direct night lighting, must be implemented to avoid a potentially significant impact on this species. Impacts would be less than significant with the implementation of **MM BIO-12**.

Solar Evaporation Ponds Project

Ash-gray Paintbrush – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake Pipeline Alignment Option (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable habitat for this species within the proposed Program Area footprint near the western end of the Baldwin Lake Pipeline Alignment Option and potential hostplant species (*Artemisia* spp.) are present in this area as well. Therefore, ash-gray paintbrush is considered absent from the proposed Program Area footprint at the time of survey and the Program will not affect this species. However, given that there is suitable habitat located in the vicinity of the BBARWA WWTP site

within which the Solar Evaporation Ponds would be installed, it is possible that the implementation of the Solar Evaporation Ponds could impact this species. Therefore, mitigation is required to ensure that impacts to this species are avoided.

In order to identify the extent of special status species plants within a given Program component, the **MM BIO-2**, which requires preconstruction clearance surveys is necessary to avoid a potentially significant impact on this species.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Impacts would be less than significant through the implementation of mitigation.

San Bernardino Blue Grass – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond Conveyance Pipeline alignment and immediately adjacent the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 2) site, respectively. There is also suitable montane meadow habitat for this species within the Baldwin Lake Pipeline Alignment Option, as well as the Solar Evaporation Ponds components of the proposed Program. However, San Bernardino blue grass was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. However, given that there is suitable habitat located in the vicinity of the BBARWA WWTP site within which the Solar Evaporation Ponds would be installed, it is possible that the implementation of the Solar Evaporation Ponds could impact this species. Therefore, mitigation is required to ensure that impacts to this species are avoided. In order to identify the extent of special status species plants within a given Program component, the **MM BIO-2**, which requires preconstruction clearance surveys, is necessary to avoid a potentially significant impact on this species.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Impacts would be less than significant through the implementation of mitigation.

Bird-foot Checkerbloom – Endangered (Federal/State)

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the proposed Solar Evaporation Ponds footprint at the BBARWA WWTP (**Figure 4.5-11**). According to the CNDDDB, bird-foot checkerbloom was also documented within the proposed Baldwin Lake Pipeline Alignment Option in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). There is also suitable montane meadow habitat for this species within the possible Shay Pond Replacement Pipeline, as well as immediately adjacent the Shay Pond Conveyance Pipeline alignment and Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program. Given that bird-foot checkerbloom is present within the proposed Program Area footprint, the Program may affect this species and construction of the proposed Solar Evaporation Ponds, as currently described, is likely to adversely affect this species. Thus, in order to avoid an adverse effect on this species, mitigation is necessary that would fully reduce impacts to a level of less than significant.

MM BIO-1 would minimize the potential for the Solar Evaporation Ponds to impact bird-foot checkerbloom as a result of Program implementation.

In order to identify the extent of the bird-foot checkerbloom, and other special status species plants within a given Program component, **MM BIO-2**, which requires preconstruction clearance surveys, shall be implemented.

MM BIO-3 and BIO-4 require orange construction fencing to be installed where special status plant species are found adjacent to a given project footprint. These measures will ensure that the bird-foot checkerbloom will be protected from construction impacts at the evaporation pond site within BBARWA's WWTP site (shown on **Figure 4.5-10**).

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

FIGURE 11

Bird-foot Checkerbloom (*Sidalcea pedata*) Observations
Replenish Big Bear Project

FIGURE 4.5-10

FIGURE 12a

FIGURE 4.5-11

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Thus, with the implementation of **MMs BIO-1 through BIO-4**, and **MMs BIO 13 through BIO-25**, impacts would be less than significant.

California Dandelion – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake Pipeline Alignment Option (2008), near the west end of the alignment, respectively. There is suitable montane meadow habitat for this species within the proposed Solar Evaporation Ponds. However, California dandelion was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. However, given that there is suitable habitat located in the vicinity of the BBARWA WWTP site within which the Solar Evaporation

Ponds would be installed, it is possible that the implementation of the Solar Evaporation Ponds could impact this species. Therefore, mitigation is required to ensure that impacts to this species are avoided.

In order to identify the extent of special status species plants within a given Program component, the **MM BIO-2**, which requires preconstruction clearance surveys, is necessary to avoid a potentially significant impact on this species.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Impacts would be less than significant through the implementation of mitigation.

Slender-petaled Thelypodium – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake Pipeline Alignment Option (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable montane meadow and big sagebrush habitat for this species within the Solar Evaporation Ponds area. However, slender-petaled thelypodium was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. However, given that there is suitable habitat located in the vicinity of the BBARWA WWTP site within which the Solar Evaporation Ponds would be installed, it is possible that the implementation of the Solar Evaporation Ponds could impact this species. Therefore, mitigation is required to ensure that impacts to this species are avoided.

In order to identify the extent of special status species plants within a given Program component, the **MM BIO-2**, which requires preconstruction clearance surveys, is necessary to avoid a potentially significant impact on this species.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

Impacts would be less than significant through the implementation of mitigation.

Unarmored Threespine Stickleback – Endangered (Federal/State)

Findings: Stickleback have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream

extent of Shay Creek, but are not located within the BBARWA WWTP Upgrade footprint, as this portion of the site is an extension of BBARWA's WWTP site and does not contain any water features that would support this species. Thus, no potential impacts to this species from implementation of the Solar Evaporation Ponds Project are anticipated.

Bald Eagle – Delisted (Federal) / Endangered (State)

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair (known as Jackie and Shadow) has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately five miles west of the Stanfield Marsh Conveyance Pipeline Discharge Outlet locations.

Big Bear Lake and Baldwin Lake support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. However, the Solar Evaporation Ponds and Baldwin Lake Pipeline Alignment Option should be constructed when those portions of Baldwin Lake are dry, as BAEA prey (i.e., fish, waterfowl.), BAEA would be expected to be absent from the Program Area. Bald eagle may utilize lakeshore perches when Baldwin Lake is dry, but since the Program will not be removing any Baldwin lakeshore trees, the only real potential for adverse impacts to overwintering BAEA is if the construction disturbance affects their utilization of these perches for foraging on fish and waterfowl. Foraging on fish and waterfowl only occurs when Baldwin Lake is wet. Thus, if construction occurs when Baldwin Lake is dry, the use of the perches would not be affected. Thus, **MM BIO-9** is required to ensure that construction occurs under these conditions, and impacts to Bald Eagle are fully mitigated. With the implementation of **MM BIO-9**, impacts would be less than significant.

Southern Rubber Boa – Threatened (State)

Findings: According to the CNDDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake Pipeline Alignment Option, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). There is some marginally suitable rubber boa habitat throughout the Program Area, however, given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, Southern Rubber Boa are not likely to be affected by the implementation of this Program Component. Thus, no potential impacts to this species from implementation of the Solar Evaporation Ponds Project are anticipated.

San Bernardino Flying Squirrel – SSC

Findings: The Flying Squirrels of Southern California is a project of the SDNHM, in collaboration with the USFS and the USFWS, to try to determine the distribution and habitat use of the flying

squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon Recharge Conveyance Pipeline, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane Pipeline Alignment Option. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, this species has been documented in residential areas in the Big Bear Valley and elsewhere. However, there is no suitable habitat at within the Solar Evaporation Ponds footprint that could support this species, and therefore, no potential impacts to this species are anticipated.

California Spotted Owl – SSC

Findings: According to the CNDDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately one mile southeast of the Sand Canyon Recharge Conveyance Pipeline. However, the Program Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region. Therefore, SPOW are not likely to occur in the Program Area. However, While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW as a result of light pollution. Therefore, to minimize impacts to this species from light pollution, **MM BIO-12**, which would protect nocturnal species from direct night lighting, must be implemented to avoid a potentially significant impact on this species. Impacts would be less than significant with the implementation of **MM BIO-12**.

Species Considered Absent for this Program Component Area

Findings: Please refer to the discussion under BBARWA WWTP, which describes the findings as to why the following species are considered absent from the entirety of the Program Area, including the Solar Evaporation Ponds.

- Cushenbury Milk-vetch – Endangered (Federal)
- Big Bear Valley Sandwort – Threatened (Federal)
- Parish's Daisy – Threatened (Federal)
- Southern Mountain Buckwheat – Threatened (Federal)
- Cushenbury Buckwheat – Endangered (Federal)
- San Bernardino Mountains bladderpod – Endangered (Federal)
- Quino Checkerspot Butterfly – Endangered (Federal)

No potential impacts to the above species are anticipated.

Sand Canyon Recharge Project

Ash-gray Paintbrush – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake Pipeline Alignment Option (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable habitat for this species within the proposed Program Area footprint near the western end of the Baldwin Lake Pipeline Alignment Option and potential hostplant species (*Artemisia* spp.) are present in this area as well. However, ash-gray paintbrush was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, ash-gray paintbrush is considered absent from

the proposed Program Area footprint at the time of survey and the Program will not affect this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

San Bernardino Blue Grass – Endangered (Federal)

Findings: San Bernardino blue grass has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond Conveyance Pipeline alignment and immediately adjacent the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 2) site, respectively. There is also suitable montane meadow habitat for this species within the Baldwin Lake Pipeline Alignment Option, as well as the Solar Evaporation Ponds components of the proposed Program. However, San Bernardino blue grass was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

Bird-foot Checkerbloom – Endangered (Federal/State)

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the proposed Solar Evaporation Ponds footprint at the BBARWA WWTP (**Figure 4.5-11**). According to the CNDDDB, bird-foot checkerbloom was also documented within the proposed Baldwin Lake Pipeline Alignment Option in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). There is also suitable montane meadow habitat for this species within the possible Shay Pond Replacement Pipeline, as well as immediately adjacent the Shay Pond Conveyance Pipeline alignment and Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program. Given that bird-foot checkerbloom is present within the proposed Program Area footprint, the Program may affect this species and construction of the Baldwin Lake Pipeline Alignment Option and proposed Solar Evaporation Ponds, as currently described, is likely to adversely affect this species. However, as no suitable habitat exists within the Sand Canyon Recharge Project footprint, it is not anticipated that this Program Component would impact this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

California Dandelion – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake Pipeline Alignment Option (2008), near the west end of the alignment, respectively. There is no suitable habitat for this species within the Sand Canyon Recharge Project footprint. California dandelion was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. However, as no suitable habitat exists within the Sand Canyon Recharge Project footprint, it is not anticipated that this Program Component would

impact this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

Slender-petaled Thelypodium – Endangered (Federal)

Findings: According to the CNDDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake Pipeline Alignment Option (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is no suitable habitat for this species within the Sand Canyon Recharge Project footprint. However, slender-petaled thelypodium was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. However, as no suitable habitat exists within the Sand Canyon Recharge Project footprint, it is not anticipated that this Program Component would impact this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

Unarmored Threespine Stickleback – Endangered (Federal/State)

Stickleback have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream extent of Shay Creek, but are not located within the Sand Canyon Recharge Project. Thus, no potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

Bald Eagle – Delisted (Federal) / Endangered (State)

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair (known as Jackie and Shadow) has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately five miles west of the Stanfield Marsh Conveyance Pipeline Discharge Outlet locations.

Big Bear Lake and Baldwin Lake support overwintering migratory BAEA, but this does not occur in the vicinity of the Sand Canyon Recharge Project footprint. This species is not known to nest in the Sand Canyon Recharge Project footprint, and therefore implementation of this Program Component would not result in any potential impacts to this species. No potential impacts to this species from implementation of the Sand Canyon Recharge Project are anticipated.

Southern Rubber Boa – Threatened (State)

Findings: According to the CNDDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake Pipeline Alignment Option, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). Additionally, although the Sand Canyon Recharge Pipe Outlet and portions of the Sand Canyon Recharge Conveyance Pipeline are adjacent undeveloped areas of potentially

suitable rubber boa habitat consisting of mixed Jeffrey pine forest and woodland and mountain juniper woodland habitats, there is no suitable rubber boa habitat within the proposed footprint of these Program components.

Due to the environmental conditions and existing disturbances within and adjacent the proposed Program Area footprint, as currently described, rubber boa is very unlikely to occur within the proposed Program Area footprint. Therefore, the proposed Program may affect, but is not likely to adversely affect this species. However, as described above, as there is some marginally suitable rubber boa habitat in the vicinity of the Sand Canyon Recharge Project. As such, **MM BIO-10** is required to avoid a potentially significant impact on this species, and ensure that pre-construction southern rubber boa surveys are conducted to ensure avoidance of impacts to this species. Impacts to this species would be less than significant with the implementation of **MM BIO-10**.

San Bernardino Flying Squirrel – SSC

Findings: The Flying Squirrels of Southern California is a project of the SDNHM, in collaboration with the USFS and the USFWS, to try to determine the distribution and habitat use of the flying squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon Recharge Conveyance Pipeline, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane Pipeline Alignment Option. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, this species has been documented in residential areas in the Big Bear Valley and elsewhere. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, there is a moderate potential for flying squirrel to occur in the Program Area and species-specific impacts avoidance and minimization measures are recommended, as required by **MM BIO-11**, for the Sand Canyon Recharge Conveyance Pipeline implementation. Impacts on this species from implementation of the Sand Canyon Recharge Conveyance Pipeline would be less than significant with the implementation of mitigation.

California Spotted Owl – SSC

Findings: According to the CNDDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately one mile southeast of the Sand Canyon Recharge Conveyance Pipeline. However, the Program Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region. Therefore, SPOW are not likely to occur in the Program Area. However, While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW as a result of light pollution. Therefore, to minimize impacts to this species from light pollution, **MM BIO-12**, which would protect nocturnal species from direct night lighting, must be implemented to avoid a potentially significant impact on this species. Impacts would be less than significant with the implementation of **MM BIO-12**.

Species Considered Absent for this Program Component Area

Findings: Please refer to the discussion under BBARWA WWTP, which describes the findings as to why the following species are considered absent from the entirety of the Program Area, including the Sand Canyon Recharge Project.

- Cushenbury Milk-vetch – Endangered (Federal)
- Big Bear Valley Sandwort – Threatened (Federal)

- Parish's Daisy – Threatened (Federal)
- Southern Mountain Buckwheat – Threatened (Federal)
- Cushenbury Buckwheat – Endangered (Federal)
- San Bernardino Mountains bladderpod – Endangered (Federal)
- Quino Checkerspot Butterfly – Endangered (Federal)

No potential impacts to the above species are anticipated.

Shay Pond Discharge Project

Ash-gray Paintbrush – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake Pipeline Alignment Option (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). Ash-gray paintbrush habitat is not anticipated to exist within the Shay Pond Discharge Project footprint. However, as the Shay Pond Replacement Pipeline alignment was not surveyed in detail, as a result of the fact that BBARWA anticipates that the existing pipeline between the BBARWA WWTP site and Shay Pond can be utilized, additional surveys must be conducted prior to implementation of Program activities within either both the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**), to assess potential Program related impacts to special status species and habitats that may occur in these areas, otherwise a potentially significant impact on a special status species may occur. This is necessary, in particular, to assess potential Program related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status plant species that may occur in this area. Thus, **MMs BIO-7 and BIO-8** are necessary to minimize impacts from the Shay Pond Discharge Project on this species. **MM BIO-7** would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat. Impacts would be less than significant with the implementation of mitigation.

San Bernardino Blue Grass – Endangered (Federal)

Findings: San Bernardino blue grass has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond Conveyance Pipeline alignment. However, San Bernardino blue grass was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, additional surveys would be necessary prior to implementation of Program activities, to assess potential Program related impacts to San Bernardino blue grass and other special status species that may occur in this area. The potential for this species to occur within these areas must be surveyed, otherwise a potentially significant impact on a special status species may occur. This is necessary, in

particular, to assess potential Program related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status plant species that may occur in this area. Thus, **MMs BIO-7 and BIO-8** are necessary to minimize impacts from the Shay Pond Discharge Project on this species. **MM BIO-7** would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat. Impacts would be less than significant with the implementation of mitigation.

Bird-foot Checkerbloom – Endangered (Federal/State)

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the proposed Solar Evaporation Ponds footprint at the BBARWA WWTP (**Figure 4.5-11**). According to the CNDDDB, bird-foot checkerbloom was also documented within the proposed Baldwin Lake Pipeline Alignment Option in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). There is also suitable montane meadow habitat for this species within the possible Shay Pond Replacement Pipeline, as well as immediately adjacent the Shay Pond Conveyance Pipeline alignment and Stanfield Marsh Conveyance Pipeline Discharge Outlet components of the proposed Program. Given that bird-foot checkerbloom is present within the proposed Program Area footprint, the Program may affect this species. Thus, prior to implementation of the Shay Pond Discharge Project, additional surveys would be necessary to assess potential Program related impacts to this species. The potential for this species to occur within these areas must be surveyed, otherwise a potentially significant impact on a special status species may occur. Thus, **MMs BIO-7 and BIO-8** are necessary to minimize impacts from the Shay Pond Discharge Project on this species. **MM BIO-7** would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat. Impacts would be less than significant with the implementation of mitigation.

California Dandelion – Endangered (Federal)

Findings: California dandelion has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake Pipeline Alignment Option (2008), near the west end of the alignment, respectively. There is suitable montane meadow habitat for this species immediately adjacent the Shay Pond Conveyance Pipeline alignment. However, California dandelion was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed

Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, additional surveys would be necessary prior to implementation of Program activities, to assess potential Program related impacts to California dandelion and other special status species that may occur in this area. Thus, prior to implementation of the Shay Pond Discharge Project, additional surveys would be necessary to assess potential Program related impacts to this species. The potential for this species to occur within these areas must be surveyed, otherwise a potentially significant impact on a special status species may occur. Thus, **MMs BIO-7 and BIO-8** are necessary to minimize impacts from the Shay Pond Discharge Project on this species. **MM BIO-7** would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat. Impacts would be less than significant with the implementation of mitigation.

Slender-petaled Thelypodium – Endangered (Federal)

Findings: Slender-petaled thelypodium has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake Pipeline Alignment Option (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable montane meadow and big sagebrush habitat for this species adjacent the Shay Pond Discharge Project components of the proposed Program. However, slender-petaled thelypodium was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, additional surveys would be necessary prior to implementation of Program activities, to assess potential Program related impacts to slender-petaled thelypodium and other special status species that may occur in this area. Thus, prior to implementation of the Shay Pond Discharge Project, additional surveys would be necessary to assess potential Program related impacts to this species. The potential for this species to occur within these areas must be surveyed, otherwise a potentially significant impact on a special status species may occur. Thus, **MMs BIO-7 and BIO-8** are necessary to minimize impacts from the Shay Pond Discharge Project on this species. **MM BIO-7** would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat. Impacts would be less than significant with the implementation of mitigation.

Unarmored Threespine Stickleback – Endangered (Federal/State)

Findings: Stickleback have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream extent of Shay Creek. The possible Shay Pond Replacement Pipeline extends through Shay Meadow, in the immediate vicinity of Shay Creek. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, the Program could potentially result in adverse effects to the Stickleback that intermittently inhabit this portion of Shay Creek. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline.

The goal of the Shay Pond Conveyance Pipeline and associated discharge outlet component of the proposed Program is to provide a more sustainable water source needed to maintain and enhance suitable Stickleback habitat conditions in Shay Pond. The Program could increase the amount of water supplied to Shay Pond from the current 50 AFY to a maximum of 80 AFY. The proposed Shay Pond Conveyance Pipeline would be constructed in an existing unpaved roadway and the discharge outlet would be constructed in an upland area immediately adjacent Shay Pond. Therefore, construction activities associated with the installation of the proposed conveyance pipeline and discharge outlet will not affect this species.

The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source supporting the Stickleback. The purified water generated by the AWPf at BBARWA, proposed under this Program, could potentially significantly impact the species, if the water source lacks the nutrients necessary to support the species, or contains any constituents that, when introduced into the Stickleback habitat, would adversely impact the species. The impacts to this species were analyzed on a more programmatic level, so that, should the individual project go forward in the future, mitigation would stipulate the steps necessary to minimize impacts from changing the water source at Shay Pond. Therefore, should the Program Team decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**, below. This **MM** details the additional studies that will be necessary to ensure that the product water is suitable to support this species. Impacts to this species would be less than significant with the implementation of **MM BIO-6**.

Bald Eagle – Delisted (Federal) / Endangered (State)

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair (known as Jackie and Shadow) has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately five miles west of the Stanfield Marsh Conveyance Pipeline Discharge Outlet locations.

Big Bear Lake and Baldwin Lake support overwintering migratory BAEA, but this does not occur in the vicinity of the Shay Pond Discharge Project footprint. This species is not known to nest in

the Shay Pond Discharge Project footprint, and therefore implementation of this Program Component would not result in any potential impacts to this species. No potential impacts to this species are anticipated.

Southern Rubber Boa – Threatened (State)

Findings: According to the CNDDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake Pipeline Alignment Option, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). There is some marginally suitable rubber boa habitat in the vicinity of the Baldwin Lake Pipeline Alignment Option consisting of mixed wet montane meadow and big sagebrush habitat, with scattered trees, large shrubs, and woody debris. Additionally, the Baldwin Lake Pipeline Alignment Option crosses an ephemeral stream (Caribou Creek) near the western end of the alignment. However, the mixed conifer-oak forest or woodland habitats that rubber boa typically occur in are absent from this area and there are no nearby rock outcrops, downed logs, or tree stumps that could provide potential rubber boa hibernacula.

There is suitable rubber boa habitat in the vicinity of the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline.

Due to the environmental conditions and existing disturbances within and adjacent the proposed Program Area footprint, as currently described, rubber boa is very unlikely to occur within the proposed Program Area footprint. Therefore, the proposed Program may affect, but is not likely to adversely affect this species. However, as described above, as there is some marginally suitable rubber boa habitat in the vicinity of the Shay Pond Discharge Project. As such, **MM BIO-10** is required to avoid a potentially significant impact on this species, and ensure that pre-construction southern rubber boa surveys are conducted to ensure avoidance of impacts to this species. Impacts to this species would be less than significant with the implementation of **MM BIO-10**.

San Bernardino Flying Squirrel – SSC

Findings: The Flying Squirrels of Southern California is a project of the SDNHM, in collaboration with the USFS and the USFWS, to try to determine the distribution and habitat use of the flying squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon Recharge Conveyance Pipeline, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane Pipeline Alignment Option. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, this species has been documented in residential areas in the Big Bear Valley and elsewhere. Thus, there is a moderate potential for flying squirrel to occur in the Program Area and species-specific impacts avoidance and minimization measures are recommended. However, as there is no suitable habitat located within the Shay Pond Discharge Project, no impacts to this species are anticipated.

California Spotted Owl – SSC

Findings: According to the CNDDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately one mile southeast of the Sand Canyon Recharge Conveyance Pipeline. However, the Program Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the

region. Therefore, SPOW are not likely to occur in the Program Area. However, While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW as a result of light pollution. Therefore, to minimize impacts to this species from light pollution, **MM BIO-12**, which would protect nocturnal species from direct night lighting, must be implemented to avoid a potentially significant impact on this species. Impacts would be less than significant with the implementation of **MM BIO-12**.

Species Considered Absent for this Program Component Area:

Findings: Please refer to the discussion under BBARWA WWTP, which describes the findings as to why the following species are considered absent from the entirety of the Program Area, including the Shay Pond Discharge Project.

- Cushenbury Milk-vetch – Endangered (Federal)
- Big Bear Valley Sandwort – Threatened (Federal)
- Parish's Daisy – Threatened (Federal)
- Southern Mountain Buckwheat – Threatened (Federal)
- Cushenbury Buckwheat – Endangered (Federal)
- San Bernardino Mountains bladderpod – Endangered (Federal)
- Quino Checkerspot Butterfly – Endangered (Federal)

No potential impacts to the above species are anticipated.

Stanfield Marsh/Big Bear Lake Discharge Project

Ash-gray Paintbrush – Threatened (Federal)

Findings: According to the CNDDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake Pipeline Alignment Option (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable habitat for this species within the proposed Program Area footprint near the western end of the Baldwin Lake Pipeline Alignment Option and potential hostplant species (*Artemisia* spp.) are present in this area as well. However, ash-gray paintbrush was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, ash-gray paintbrush is considered absent from the proposed Program Area footprint at the time of survey and the Program will not affect this species. Given that there is suitable habitat located in the vicinity of the Baldwin Lake Pipeline Alignment Option, it is possible that, if the Baldwin Lake Pipeline Alignment Option is selected, potentially significant impacts to this species could occur. In implementing the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option, no impacts would occur and no mitigation would be required. However, for the Baldwin Lake Pipeline Alignment Option mitigation, is required to ensure that impacts to this species are avoided.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant.

San Bernardino Blue Grass – Endangered (Federal)

Findings: San Bernardino blue grass has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond Conveyance Pipeline alignment and immediately adjacent the Stanfield Marsh Conveyance Pipeline Discharge Outlet (Option 2) site, respectively. There is also suitable montane meadow habitat for this species within the Baldwin Lake Pipeline Alignment Option, as well as the Solar Evaporation Ponds components of the proposed Program. However, San Bernardino blue grass was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Given that there is suitable habitat located in the vicinity of the Baldwin Lake Pipeline Alignment Option, it is possible that, if the Baldwin Lake Pipeline Alignment Option is selected, potentially significant impacts to this species could occur. In implementing the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option, no impacts would occur and no mitigation would be required. However, for the Baldwin Lake Pipeline Alignment Option mitigation, is required to ensure that impacts to this species are avoided.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant. Overall, through the implementation of mitigation, impacts to this species would be less than significant.

Bird-foot Checkerbloom – Endangered (Federal/State)

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake Pipeline Alignment Option and the proposed Solar Evaporation Ponds footprint at the BBARWA WWTP (**Figure 4.5-11**). According to the CNDDDB, bird-foot checkerbloom was also documented within the proposed Baldwin Lake Pipeline Alignment Option in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). Given that bird-foot checkerbloom is present within the proposed Program Area footprint, the Program may affect this species and construction of the Baldwin Lake Pipeline Alignment Option, as currently described, is likely to adversely affect this species. If the species cannot be avoided due to the design or other engineering constraints, impacts to this species from implementation of the Baldwin Lake Pipeline Alignment Option would be significant and unavoidable. In implementing the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option, no impacts

would occur and no mitigation would be required, as this species does not occur within these Alignment Options.

In order to identify the extent of the bird-foot checkerbloom, and other special status species plants within a given Program component, **MM BIO-2**, which requires preconstruction clearance surveys, shall be implemented.

The Baldwin Lake Pipeline Alignment Option is being considered by BBARWA, as it would avoid a large portion of construction within residential roadways that would otherwise occur under other Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options. If the Baldwin Lake Pipeline Alignment Option is selected, **MM BIO-5** would be necessary to minimize impacts to the bird-foot checkerbloom species to the greatest extent feasible without avoiding this Alignment Option completely, but it would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. Therefore, even with the implementation of the above mitigation measures, impacts to this species cannot be fully avoided due to its presence within the Baldwin Lake Pipeline Alignment Option.

While impacts to this species cannot be fully avoided, additional mitigation shall be implemented to further minimize impacts to this species to the greatest extent feasible. Thus, **MM BIO-13** would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to the greatest extent feasible. However, as stated above, **MM BIO-5** would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option. No impacts would occur to this species from implementation of the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option.

California Dandelion – Endangered (Federal)

Findings: California dandelion has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake Pipeline Alignment Option (2008), near the west end of the alignment, respectively. There is suitable montane meadow habitat for this species within the Baldwin Lake Pipeline Alignment Option. However, California dandelion was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Given that there is suitable habitat located in the vicinity of the Baldwin Lake Pipeline Alignment Option, it is possible that, if the Baldwin Lake Pipeline Alignment Option is selected, potentially significant impacts to this species could occur. In implementing the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option, no impacts would occur and no mitigation would be

required. However, for the Baldwin Lake Pipeline Alignment Option mitigation, is required to ensure that impacts to this species are avoided.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant. Overall, through the implementation of mitigation, impacts to this species would be less than significant.

Slender-petaled Thelypodium – Endangered (Federal)

Findings: Slender-petaled thelypodium has been documented within the possible Shay Pond Replacement Pipeline. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. According to the CNDDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake Pipeline Alignment Option (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable montane meadow and big sagebrush habitat for this species within the Baldwin Lake Pipeline Alignment Option. However, slender-petaled thelypodium was not observed within the proposed Program Area footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Program Area footprint at the time of survey and the Program, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, additional surveys would be necessary prior to implementation of Program activities, to assess potential Program related impacts to slender-petaled thelypodium and other special status species that may occur in this area. Given that there is suitable habitat located in the vicinity of the Baldwin Lake Pipeline Alignment Option, it is possible that, if the Baldwin Lake Pipeline Alignment Option is selected, potentially significant impacts to this species could occur. In implementing the Meadow Lane Pipeline Alignment Option, West Neighborhoods Pipeline Alignment Option, and/or the East Neighborhoods Pipeline Alignment Option, no impacts would occur and no mitigation would be required. However, for the Baldwin Lake Pipeline Alignment Option mitigation, is required to ensure that impacts to this species are avoided.

MM BIO-13 would ensure that the protective **MMs** provided herein are successfully implemented for the duration of construction and operation of future Program facilities through the implementation of a Biological Resources Management Plan, which would ensure direct and indirect impacts to this species are minimized to the extent feasible.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to this species are reduced to a level of less than significant. Overall, through the implementation of mitigation, impacts to this species would be less than significant.

Unarmored Threespine Stickleback – Endangered (Federal/State)

Stickleback have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream extent

of Shay Creek, but are not located within any of the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option footprints. Thus, no potential impacts to this species are anticipated.

Bald Eagle – Delisted (Federal) / Endangered (State)

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair (known as Jackie and Shadow) has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately five miles west of the Stanfield Marsh Conveyance Pipeline Discharge Outlet locations.

Big Bear Lake and Baldwin Lake support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. However, the Baldwin Lake Pipeline Alignment Option should be constructed when those portions of Baldwin Lake are dry, as BAEA prey (i.e., fish, waterfowl.), BAEA would be expected to be absent from the Program Area. Bald eagle may utilize lakeshore perches when Baldwin Lake is dry, but since the Program will not be removing any Baldwin lakeshore trees, the only real potential for adverse impacts to overwintering BAEA is if the construction disturbance affects their utilization of these perches for foraging on fish and waterfowl. Foraging on fish and waterfowl only occurs when Baldwin Lake is wet. Thus, if construction occurs when Baldwin Lake is dry, the use of the perches would not be affected. Thus, **MM BIO-9** is required to ensure that construction occurs under these conditions, and impacts to Bald Eagle are fully mitigated. With the implementation of **MM BIO-9**, impacts would be less than significant.

Southern Rubber Boa – Threatened (State)

Findings: According to the CNDDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake Pipeline Alignment Option, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). There is some marginally suitable rubber boa habitat in the vicinity of the Baldwin Lake Pipeline Alignment Option consisting of mixed wet montane meadow and big sagebrush habitat, with scattered trees, large shrubs, and woody debris. Additionally, the Baldwin Lake Pipeline Alignment Option crosses an ephemeral stream (Caribou Creek) near the western end of the alignment. However, the mixed conifer-oak forest or woodland habitats that rubber boa typically occur in are absent from this area and there are no nearby rock outcrops, downed logs, or tree stumps that could provide potential rubber boa hibernacula. Given the existing human disturbance adjacent the Program Area, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, Southern Rubber Boa are not likely to be affected by the implementation of this Program Component. Thus, no potential impacts to this species from implementation of the Stanfield Marsh/Big Bear Lake Discharge Project are anticipated.

San Bernardino Flying Squirrel – SSC

Findings: The Flying Squirrels of Southern California is a project of the SDNHM, in collaboration with the USFS and the USFWS, to try to determine the distribution and habitat use of the flying squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon Recharge Conveyance Pipeline, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane Pipeline Alignment Option. Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, there is a moderate potential for flying squirrel to occur in the Program Area and species-specific impacts avoidance and minimization measures are recommended, as required by **MM BIO-11**, for the Meadow Lane Pipeline Alignment Option, East Neighborhoods Pipeline Alignment Option, and West Neighborhoods Pipeline Alignment Option, implementation. Implementation of the Baldwin Lake Pipeline Alignment Option does not require implementation of mitigation to avoid impacts to this species, as no suitable habitat exists within this Alignment Option. Impacts on this species from implementation of the Meadow Lane Pipeline Alignment Option, East Neighborhoods Pipeline Alignment Option, and West Neighborhoods Pipeline Alignment Option would be less than significant with the implementation of mitigation.

California Spotted Owl – SSC

Findings: According to the CNDDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately one mile southeast of the Sand Canyon Recharge Conveyance Pipeline. However, the Program Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region. Therefore, SPOW are not likely to occur in the Program Area. However, While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW as a result of light pollution. Therefore, to minimize impacts to this species from light pollution, **MM BIO-12**, which would protect nocturnal species from direct night lighting, must be implemented to avoid a potentially significant impact on this species. Impacts would be less than significant with the implementation of **MM BIO-12**.

Species Considered Absent for this Program Component Area

Findings: Please refer to the discussion under BBARWA WWTP, which describes the findings as to why the following species are considered absent from the entirety of the Program Area, including the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options.

- Cushenbury Milk-vetch – Endangered (Federal)
- Big Bear Valley Sandwort – Threatened (Federal)
- Parish's Daisy – Threatened (Federal)
- Southern Mountain Buckwheat – Threatened (Federal)
- Cushenbury Buckwheat – Endangered (Federal)
- San Bernardino Mountains bladderpod – Endangered (Federal)
- Quino Checkerspot Butterfly – Endangered (Federal)

No potential impacts to the above species are anticipated.

Conclusion

Table 4.5-3 (below) provides a list of all state and/or federally listed or proposed threatened and endangered species identified by the CNDDDB and IPaC queries, where they are found (locally,

adjacent to the proposed Program Area footprint, or within the proposed Program Area footprint), if suitable habitat for that species exists within the Program Area and whether the Program may affect that species.

**Table 4.5-3
 LISTED SPECIES DOCUMENTED IN THE PROGRAM VICINITY**

Common Name	Scientific Name	Status	Found Locally	Found Adjacent	Found Within	Suitable Habitat	Program Affect
<u>Plants:</u>							
Cushenbury oxytheca	<i>Acanthoscyphus parishii</i> var. <i>goodmaniana</i>	FE	No	No	No	None	No impact
Cushenbury milk-vetch	<i>Astragalus albens</i>	FE	No	No	No	None	No impact
ash-gray paintbrush	<i>Castilleja cinerea</i>	FT	Yes	Yes	No	Yes	Less than significant impact with mitigation
Big Bear Valley sandwort	<i>Eremogone ursina</i>	FT	Yes	No	No	None	No impact
Parish's daisy	<i>Erigeron parishii</i>	FT	No	No	No	None	No impact
southern mountain buckwheat	<i>Eriogonum kennedyi</i> var. <i>austromontanum</i>	FT	Yes	No	No	None	No impact
Cushenbury buckwheat	<i>Eriogonum ovalifolium</i> var. <i>vineum</i>	FE	Yes	No	No	None	No impact
San Bernardino Mountains bladderpod	<i>Physaria kingii</i> ssp. <i>bernardina</i>	FE	No	No	No	None	No impact
San Bernardino blue grass	<i>Poa atropurpurea</i>	FE	Yes	Yes	No	Yes	Less than significant impact with mitigation
bird-foot checkerbloom	<i>Sidalcea pedata</i>	FE/SE	Yes	Yes	Yes	Yes	Significant Impact
California dandelion	<i>Taraxacum californicum</i>	FE	Yes	Yes	No	Yes	Less than significant impact with mitigation
slender-petaled thelypodium	<i>Thelypodium stenopetalum</i>	FE/SE	Yes	Yes	No	Yes	Less than significant impact with mitigation
<u>Insects:</u>							
quino checkerspot butterfly	<i>Euphydryas editha quino</i>	FE	No	No	No	None	No impact
<u>Amphibians:</u>							
southern mountain yellow-legged frog	<i>Rana muscosa</i>	FE/SE	No	No	No	None	No impact
<u>Fish:</u>							
unarmored threespine stickleback	<i>Gasterosteus aculeatus williamsoni</i>	FE/SE	Yes	Yes	No	Adjacent	Less than significant impact with mitigation
steelhead - southern California DPS	<i>Oncorhynchus mykiss irideus</i> pop. 10	FE	No	No	No	None	No impact
<u>Birds:</u>							
southwestern willow flycatcher	<i>Empidonax traillii extimus</i>	FE/SE	No	No	No	None	No impact

Common Name	Scientific Name	Status	Found Locally	Found Adjacent	Found Within	Suitable Habitat	Program Affect
bald eagle	<i>Haliaeetus leucocephalus</i>	FD/SE	Yes	Yes	No	Adjacent	Less than significant impact with mitigation
California spotted owl	<i>Strix occidentalis occidentalis</i>	FPE	No	No	No	None	Less than significant impact with mitigation
Reptiles:							
southern rubber boa	<i>Charina umbratica</i>	ST	Yes	No	No	Yes	Less than significant impact
Mojave desert tortoise	<i>Gopherus agassizii</i>	FT/ST	No	No	No	None	No impact

Notes: FE = Federally Endangered FT = Federally Threatened SE = State Endangered ST = State Threatened

Ultimately, several special status plant species have been documented in the vicinity of the possible Shay Pond Replacement Pipeline including the federally listed as endangered San Bernardino blue grass and California dandelion, and the state and federally listed as endangered slender-petaled thelypodium. However, the Program Team does not anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline and this alignment was not included in the floristic botanical field surveys. Should replacement of the existing pipeline to the new Shay Pond Conveyance Pipeline be required, additional surveys would be necessary prior to implementation of Program activities, to assess potential Program related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status species that may occur in this area. Additionally, precautionary measures are recommended to avoid Program related effects on the state and federally listed as endangered bird-foot checkerbloom for all Program Components except for implementation of the Baldwin Lake Pipeline Alignment Option, if selected as the preferred Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Option.

The Program would have a potentially significant impact the state and federally listed as endangered Stickleback, the state listed (federally delisted) as endangered BAEA, and the state listed as threatened southern rubber boa. Additionally, there is a moderate potential for the California SSC San Bernardino flying squirrel to occur in the Program Area. Therefore, precautionary measures are recommended to avoid or minimize any potential Program related effects on Stickleback, BAEA, rubber boa, and flying squirrel to a level of less than significant. Each of these measures are necessary to reduce impacts to these species, and their purpose in reducing impacts to each these species are discussed in detail under **MMs**, below.

Other Physical Changes to the Environment

No physical changes to the present conditions at the LV Site would be expected to occur at the LV Site from the change in discharge volume that would occur under the proposed Program. As such, no biological resources are expected to be directly or indirectly impacted by the reduced discharge to the LV Site that would occur as a result of Program implementation.

The impacts to the Shay Pond from the introduction of the new purified water source resulting from the implementation of the Program, have been identified above, and mitigative actions are proposed below under *Mitigation Measures*. The Program would provide a more sustainable water source needed to maintain and enhance suitable Stickleback habitat conditions in Shay Pond. The utilization of the Program Water in support of Shay Pond resulting from implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the regulatory costs and hurdles that would be necessary to modify the water source

supporting the Stickleback. However, the necessary steps required to ensure protection of the Stickleback should the Shay Pond Discharge Project go forward in the future has been documented herein and the change in water source at Shay Pond in support of the Stickleback has been analyzed herein at a programmatic level. The purified water generated by the AWPf at BBARWA, proposed under this Program, could potentially significantly impact the species if the water source lacks the nutrients necessary to support the species, or contains any constituents that, when introduced into the Stickleback habitat, would adversely impact the species. The impacts to this species were analyzed on a more programmatic level, so that, should the individual project go forward in the future, mitigation would stipulate the steps necessary to minimize impacts from changing the water source at Shay Pond. Therefore, should the Program Team decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**, below. This **MM** details the additional studies that will be necessary to ensure that the product water is suitable to support this species. Impacts to this species would be less than significant with the implementation of **MM BIO-6**.

Impacts to special status species may occur if the beneficial uses listed in **Table 3-2** are obstructed as a result of the proposed Program from the discharge of purified water to Big Bear Lake via Stanfield Marsh. Beneficial uses of Big Bear Lake and Stanfield Marsh include Wildlife Habitat (WILD)—i.e. uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources—and Rare, Threatened, or Endangered Species (RARE)—uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered. Thus, maintaining the beneficial uses of these water bodies is paramount to protecting the rare, threatened, and/or endangered species, and wildlife habitats found therein.

In order to determine whether the Program would impact beneficial uses of Stanfield Marsh or Big Bear Lake, water quality objectives must be analyzed, as these objectives inform the beneficial use determination analyzed below. If the water quality objectives are met by the purified water discharge to Stanfield Marsh and Big Bear Lake, then the beneficial uses can demonstrably be preserved by the Program, and thereby protect special status habitats and species that are protected by the beneficial uses of these waters.

A technical memorandum (Memo) was prepared by GEI titled “*Analysis of Aquatic Life Effects of Replenish Big Bear Program’s Discharge to Stanfield Marsh,*” and dated October 2023 (**Appendix 19**) to determine whether the Program Water would contain any constituents of interest (COI) that could impact rare, threatened, and endangered species, or any other beneficial use of either Big Bear Lake or Stanfield Marsh. This Memo evaluated modeled outputs from Dr. Anderson’s Big Bear Lake model, partial data from the BBARWA AWPf pilot study collected from June through September 2023, and the antidegradation analysis to evaluate potential impacts on beneficial uses related to aquatic life. The Memo also described the data gaps that limit GEI’s understanding of how the Stanfield Marsh/Big Bear Lake discharge will affect beneficial uses related to aquatic life and how these beneficial uses of Stanfield Marsh and Big Bear Lake will be protected through the implementation of the Program. Data gaps and sources of uncertainty were addressed by recommending an adaptive management and monitoring plan.

The discharge to Shay Pond was not evaluated by GEI in this Memo because this Program Component will not be implemented in the near future. This is because the utilization of the Program Water in support of Shay Pond resulting from the implementation of the proposed Program is currently being considered at a conceptual level by the Program Team due to the

regulatory costs and hurdles that would be necessary to modify the water source supporting the Stickleback. Should the Program Team decide to modify the water supply at Shay Pond, the water quality impacts on the Stickleback and Shay Pond shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**.

The GEI Memo reviewed and identified the beneficial uses of Stanfield Marsh and Big Bear Lake that protect aquatic life, wildlife, and habitats to assess the water quality conditions that could impact these beneficial uses. The beneficial uses of both Stanfield Marsh and Big Bear Lake are listed in **Table 4.11-1**. The beneficial uses defined in the Santa Ana Basin Plan for Big Bear Lake and Stanfield Marsh that protect aquatic life, wildlife, and habitats and are described below:

- **Commercial and Sport Fishing (COMM)** Uses of water for commercial or recreational collection of fish and shellfish, or other organisms including, but not limited to, uses involving organisms intended for human consumption or bait purposes.
 - This beneficial use protects commercial fishing, which can be an indicator of the health of the wildlife and special status species utilizing Big Bear Lake for foraging and food, such as Bald Eagle. Thus, the preservation of this beneficial use indicates that discharge of Program Water to Stanfield Marsh and Big Bear Lake would not significantly impact wildlife, special status habitats, and special status species.
- **Warm Freshwater Habitat (WARM)** Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
 - This beneficial use protects warm water ecosystems that may support wildlife, special status habitats, and special status species. Thus, the preservation of this beneficial use indicates that discharge of Program Water to Stanfield Marsh and Big Bear Lake would not significantly impact wildlife, special status habitats, and special status species.
- **Cold Freshwater Habitat (COLD)** Uses of water that support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
 - This beneficial use protects cold water ecosystems that may support wildlife, special status habitats, and special status species. Thus, the preservation of this beneficial use indicates that discharge of Program Water to Stanfield Marsh and Big Bear Lake would not significantly impact wildlife, special status habitats, and special status species.
- **Wildlife Habitat (WILD)** Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.
 - This beneficial use protects ecosystems that may support wildlife, special status habitats, and special status species. Thus, the preservation of this beneficial use indicates that discharge of Program Water to Stanfield Marsh and Big Bear Lake would not significantly impact wildlife, special status habitats, and special status species.
- **Rare, Threatened, or Endangered Species (RARE)** Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.
 - This beneficial use protects habitats that may support wildlife, special status habitats, and special status species. Thus, the preservation of this beneficial use

indicates that discharge of Program Water to Stanfield Marsh and Big Bear Lake would not significantly impact wildlife, special status habitats, and special status species.

The parameters that were identified by the GEI Memo that could potentially impact these beneficial uses are algae, temperature, nutrients, dissolved oxygen, pH, boron, and reinvasion by undesirable species. The general observations, analyses, and conclusions of are summarized in Section 4.11. A brief overview of these indicators is provided below, which discusses how the COMM, WARM, COLD, WILD, and RARE beneficial uses can be maintained as part of the Program, thereby protecting the special status species and habitats by which the beneficial uses support.

Algae

It is possible that the rewetting of Stanfield Marsh will result in an increase in biologically available phosphorus,⁷³ which would increase algal growth in Stanfield Marsh, and in Big Bear Lake, if Stanfield Marsh spilled to the lake during rewetting. The increase in phosphorus depends on interstitial pore size, total organic carbon in soils,⁷⁴ presence of aquatic vegetation, and the extent of the varial zone.⁷⁵ A small varial zone may help reduce the amount of phosphorus that is re-released into the aquatic environment. Other factors can include the seasonal timing of rewetting and the amount of uptake and storage by rooted and floating macrophytes – management strategies such as planting of rooted macrophytes can be employed during rewetting, to reduce the amount of phosphorus that remains in Stanfield Marsh and moved into the Big Bear Lake.⁷⁶ Limiting the available nutrients in the water column would reduce the probability of nuisance algae blooms. Physical conditions in the rewetted Stanfield Marsh and projected levels of phosphorus in the Program Water should not contribute to increased levels of cyanobacteria. The rewetted Stanfield Marsh will be shallow and well-mixed.⁷⁷ Cyanobacteria benefit from stratified conditions because of their natural buoyancy but do not thrive in well-mixed water columns. Thus, it is not anticipated that excessive algal growth in inland surface receiving waters would occur, and therefore, the narrative criterion for algae is predicted to be met by the proposed Program. As a result, the beneficial uses would be maintained under the Program, thereby protecting the special status species and habitats by which the beneficial uses support. No impacts related to beneficial uses from algae are anticipated to occur.

Temperature

The COLD beneficial use is more stringent than the WARM beneficial use. Because Stanfield Marsh was mostly dry from 2015 through 2022, temperature modeling was required to estimate Program effects.⁷⁸ Dr. Anderson used his Big Bear Lake model to simulate a run for a five-year period, with minimum effluent temperatures of 12 degrees Celsius (°C), a maximum temperature of 22°C, and a scenario of approximately 2,200 AFY of discharge.

⁷⁷ Dr. Anderson, personal communication 08/2023

⁷⁸ Dr. Anderson, M. 2022a. Assessment of Inflow Temperature on Temperature in Stanfield Marsh and Big Bear Lake.

Under the modeling scenario, water temperature excursions over 5°F/2.8°C in Stanfield Marsh only occurred during discrete periods when water levels were exceptionally low (≤ 1 meter). However, because of the frequency at which low water levels would occur, the number of excursions would be substantial. Results from the Assessment of Inflow Temperature on Temperature in Stanfield Marsh and Big Bear Lake prepared by Dr. Anderson highlighted some important general findings. Stanfield Marsh and Big Bear Lake are hydrologically connected through a set of culverts. For water flows to move from Stanfield Marsh into Big Bear Lake, Stanfield Marsh must first be filled before it starts flowing into the Big Bear Lake. Warm Program Water discharged to the easternmost section of Stanfield Marsh will quickly lose heat through exchange with the atmosphere and will be diluted with existing water. Higher lake levels afford greater opportunity for heat loss and dilution such that temperature effects are more likely at low lake levels. As a result of the modeling, the addition of warm Program Water to Stanfield Marsh does not alter the heat budget for Big Bear Lake and is not predicted to alter lake temperature, duration, or intensity of thermal stratification.

Program-specific information about inflow temperatures is needed to conduct a more complete analysis. Temperature represents beneficial uses for both Stanfield Marsh and Big Bear Lake that could potentially impact special status species if obstructed by the Program. As such, mitigation is necessary to minimize the potential for inflow temperature to Stanfield Marsh and Big Bear Lake falls within the confines of the narrative temperature WQO. **MM HYD-1** would monitor the temperature of the Program Water and, if observed exceeding the NPDES permit requirements (which would be crafted pursuant to the WQOs), corrective actions would be taken, thereby ensuring the temperature based beneficial uses are maintained under the Program, thereby protecting the special status species and habitats by which the beneficial uses support. Thus, impacts to beneficial uses from temperature would be less than significant through the implementation of mitigation.

Nutrients

Nutrient constituents are typically TIN, TN, TP, and chlorophyll-a. As discussed in the Antidegradation Analysis (**Appendix 3**), the proposed discharge is estimated to improve water quality in Big Bear Lake for TN, TP, and chlorophyll-a, maintain similar water quality for TIN. The predicted long-term average concentrations of TIN, TN, TP, and chlorophyll-a were lower with the proposed Program Water at various rates as compared to the predicted baseline condition, except for TIN under the 2,210 AFY + TP Offset. It is unclear why the model predicted increased TIN under this scenario while all other scenarios showed significantly reduced TIN values relative to the modeled baseline; however, the modeled difference in TIN between the Baseline and 2,210 AFY + TP Offset scenarios is approximately 4 percent, which is within the range of model variance and is considered statistically insignificant.

Although modeling shows the projected long-term average concentration of TIN is similar to the modeled baseline condition, the pilot study results (**Appendix 19** Table 3 of GEI's TM) indicated that the average TIN exceeded the Santa Ana Basin Plan WQO. Treatment process optimization is being explored to attain a higher removal efficiency to meet the most stringent TIN WQO of 0.15 ppm. As TIN has a WQO under the Basin Plan, if this objective is not met, the beneficial uses of Stanfield Marsh and/or Big Bear Lake that could potentially impact special status species may be obstructed by the Program. For the purposes of this analysis, it is assumed that treatment optimization will result in attainment of 0.15 ppm TIN. As a result, the beneficial uses would be maintained under the Program, thereby protecting the special status species and habitats by which the beneficial uses support. However, if additional treatment equipment is needed to meet this objective or if regulatory compliance mechanisms are pursued to allow discharge above the objectives, consistency with the Program CEQA documentation will be verified, and, if determined

necessary to comply with CEQA, subsequent CEQA documentation will be conducted. Impacts under this issue would therefore be less than significant.

Data Gaps and Limitations

Although modeling and a pilot study has been conducted for this Program, there are still some data gaps to better understand the potential impacts to the designated beneficial uses for Stanfield Marsh and Big Bear Lake with respect to aquatic wildlife and plants. These data gaps would be best resolved when Program Water is discharged to Stanfield Marsh, and and further, would be monitored with mitigative adaptation to any impacts through **MM HYD-1**. Constituents of interest with data gaps are boron, dissolved oxygen, pH, and temperature. These constituents are further explained below. However, the specific data gaps for each COI are outlined as follows:

- **Boron:** There is uncertainty as to how boron would be assimilated into Stanfield Marsh. It appears that uptake by plants can be a significant source of sequestration of boron, suggesting that management of rooted macrophytes may provide a method of removing excess boron from Stanfield Marsh. To determine potential impacts on aquatic wildlife and plants in Stanfield Marsh and Big Bear Lake, it is recommended to conduct boron monitoring once Program Water is discharged to Stanfield Marsh. Quarterly monitoring is recommended of the Program Water to observe the boron concentration prior to introduction into Stanfield Marsh and at the existing TMDL Sampling Station MWDL9. This location is already an established sampling station through the Big Bear Lake Nutrient TMDL and is representative of Stanfield
- **Dissolved Oxygen:** Dissolved Oxygen has a narrative WQO that must be met pursuant to the WARM and COLD beneficial uses, and is therefore integral to protecting the special status species and habitats that are supported by the beneficial uses of Stanfield Marsh and Big Bear Lake. Data is not currently available to predict dissolved oxygen levels in Stanfield Marsh, Big Bear Lake, or purified water. However, low dissolved oxygen levels could be ameliorated through aeration of effluent. Stanfield Marsh is shallow enough that stratification is unlikely to occur (Dr. Anderson, personal communication). In other words, the water column in Stanfield Marsh would be mixed through water movement and via wind mixing, which would facilitate roughly equal concentrations of dissolved oxygen throughout the water column. Also, it is possible to speculate on dissolved oxygen levels in the Program Water, but there is considerable uncertainty surrounding what will happen when this Program Water enters Stanfield Marsh. Low-nutrient water entering Stanfield Marsh may also suppress dissolved oxygen levels by reducing algae and macrophyte production of dissolved oxygen (Dr. Anderson, personal communication). To determine potential impacts to aquatic wildlife, once Program Water is discharged into Stanfield Marsh, dissolved oxygen should be monitored during and after re-wetting of Stanfield Marsh at the Program Water effluent and at existing TMDL Sampling Station MWDL9. If observed dissolved oxygen levels do not meet the Basin Plan WQO designated beneficial uses for COLD and WARM, mitigative actions may include but not be limited to the introduction of a chemical or mechanical intervention to stabilize dissolved oxygen levels. **MM HYD-1** would monitor the dissolved oxygen levels of the Program Water and, if observed exceeding the NPDES permit requirements (which would be crafted pursuant to the WQOs), corrective actions would be taken, thereby ensuring the beneficial uses are maintained under the Program by meeting the WQOs, and thereby protecting the special status species and habitats by which the beneficial uses support. Thus, impacts to beneficial uses from dissolved oxygen would be less than significant through the implementation of mitigation.
- **pH:** The buffering capacity of Stanfield Marsh itself is currently unknown because it has been mostly dry since 2015, but soil chemistry has a large effect on the pH of small bodies of water. As such, it is not presently known precisely how the Program will impact the pH

of Stanfield Marsh, and therefore observation of how the Program Water interacts with the existing water sources in Stanfield Marsh and Big Bear Lake upon Program operation, is necessary to bridge this data gap. To determine potential impacts to aquatic wildlife, once Program Water is discharged into Stanfield Marsh, pH should be monitored during and after re-wetting of Stanfield Marsh at the Program Water effluent and at existing TMDL Sampling Station MWDL9. If observed pH levels do not meet the Basin Plan WQO for inland surface waters, the beneficial uses of Stanfield Marsh and/or Big Bear Lake that could potentially impact special status species may be obstructed by the Program. As such, mitigative actions may include but not be limited to introduction of a chemical intervention to stabilize pH levels. **MM HYD-1** would monitor the pH levels of the Program Water and, if observed exceeding the NPDES permit requirements (which would be crafted pursuant to the WQOs), corrective actions would be taken, thereby ensuring the beneficial uses are maintained under the Program by meeting the WQOs, and thereby protecting the special status species and habitats by which the beneficial uses support. Thus, impacts to beneficial uses from pH would be less than significant through the implementation of mitigation.

- **Temperature:** There is uncertainty about predicted temperatures arise because no temperature data are available for the Program's Water - theoretical temperature ranges were developed using data from a pilot project near sea level and corrected for elevation, but still, there is a gap in data that can only be filled once the Program is operational. As indicated in earlier discussions on the temperature modeling data, additional monitoring is recommended once the Program's Water is discharged into Stanfield Marsh. Temperature modeling is recommended to be conducted using an online analyzer to obtain continuous readings of the Program Water effluent and in Stanfield Marsh. Similar to previous discussions on location of monitoring, the existing TMDL Sampling Station MWDL9 can be utilized. If observed temperature levels do not meet the Basin Plan WQO designated beneficial uses for COLD and WARM, mitigative actions may include but not be limited to introduction of a temperature cooling mechanism to lower the temperature of the Program Water introduced into Stanfield Marsh. **MM HYD-1** would monitor the temperature of the Program Water discharge, and if observed exceeding the NPDES permit requirements (which would be crafted pursuant to the WQOs), corrective actions would be taken, thereby ensuring the temperature based beneficial uses are maintained under the Program, thereby protecting the special status species and habitats by which the beneficial uses support. Thus, impacts to beneficial uses from temperature would be less than significant through the implementation of mitigation.
- **Reinvasion of Invasive Species:** Invasive plants and aquatic animals (vertebrate or otherwise) will be able to access Stanfield Marsh when it is rewetted. Because it is upstream of Big Bear Lake, it may be desirable to prevent contamination of Stanfield Marsh by species such as Eurasian Watermilfoil (*Myriophyllum spicatum*) and Common Carp (*Cyprinus carpio*), which are known invasive species that appear in Big Bear Lake. Proliferation of Eurasian Watermilfoil can cause periodic depression in dissolved oxygen levels, and this species adversely affects all beneficial uses relating to the protection of aquatic life. As the reinvasion by undesirable species can only occur once Stanfield Marsh is rewetted, monitoring is the only means by which to observe whether such species become invasive in Stanfield Marsh from Program implementation. Thus, it is recommended for monitoring to be conducted at least on a bi-yearly basis to observe the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake, which shall be a requirement of Program implementation through **MM HYD-1**. Furthermore, mitigative actions under **MM HYD-1** if invasive species are observed would include invasive plant removal, introduction of native species known to eradicate invasive species, or other mitigative actions to remove the invasive species present as a result of

introduction of the Program Water. Additionally, **MM HYD-1** requires an account of invasive species within Stanfield Marsh and Big Bear Lake to be undertaken prior to discharge into Stanfield Marsh to set a baseline for what invasive species exist prior to operation of the Program. This would protect the beneficial uses of Stanfield Marsh and Big Bear Lake by preventing invasive species proliferation in Stanfield Marsh and Big Bear Lake, thereby protecting the special status species and habitats by which the beneficial uses support. Thus, impacts to beneficial uses from invasive species would be less than significant through the implementation of mitigation.

Overall, the general findings of this Memo are that the Program water discharge to Big Bear Lake via Stanfield Marsh is not anticipated to have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW or USFS. In fact, the provision of additional high-quality water to Big Bear Lake via Stanfield Marsh is more likely to benefit the habitat and thereby the species supported by the habitat at Big Bear Lake and Stanfield Marsh because the provision of additional water would promote growth of the existing habitat and creation of new habitat that would facilitate a commensurate increase in habitat availability for species supported by the habitat within the Stanfield Marsh. However, there are data gaps that must be addressed to support GEI's understanding of the impacts. Data gaps and sources of uncertainty are addressed as part of an AMMP that will be enforced through **MM HYD-1**.

The Program's Water would help support the RARE and WILD beneficial uses simply by re-wetting the area. **Exhibit 4.5-1** shows Big Bear Lake area was at a record low in 2018 and Stanfield Marsh was dry. Extensive modeling by Dr. Anderson showed that the release of water into Big Bear Lake through Stanfield Marsh would result in large increases in lake water surface elevation and lake water surface area. **Exhibit 4.5-2** shows this increase in inundated area would extend into Stanfield Marsh. Even under a scenario of protracted drought, defined as the fifth percentile of flows entering Stanfield Marsh and Big Bear Lake, at least some water would remain in Stanfield Marsh. This is in stark contrast to existing conditions, wherein the Stanfield Marsh has been mostly dry for several years. Some potential benefits are outlined below.

- Availability of water will allow the establishment of riparian plants, macrophytes, and algae, as well as the invertebrate and vertebrate fauna that rely upon them.
- Some organisms have the ability to adapt to extremely variable environments. For example, highly mobile animals (e.g., waterfowl) will avoid or emigrate from dry areas, and drought-tolerant plants can survive in a wide variety of moisture regimes or can remain dormant for long periods of time. However, less mobile/more specialized species are excluded from highly unpredictable environments. Reducing the degree of disturbance (i.e., episodic drying) will allow more species to utilize the area.
- Maintaining water levels in Stanfield Marsh may also increase lakeshore fringe habitat, which is currently limited due to water level fluctuations. This habitat type is utilized by rare birds (American Bald Eagle *Haliaeetus leucocephalus*, Southwestern Willow Flycatcher *Empidonax traillii extimus*), rare mammals (San Bernardino Flying Squirrel *Glaucomys sarinus*), and rare plants (Slender-petaled Thelypodium *Thelypodium stenopetalum*). Other more common species would benefit from the presence of lakeshore fringe and open water habitat as well. These include amphibians, ducks/wading birds, and bats that forage over open water.

Returning a reliable source of water to Stanfield Marsh would unequivocally benefit wildlife, particularly aquatic or semi-aquatic species.

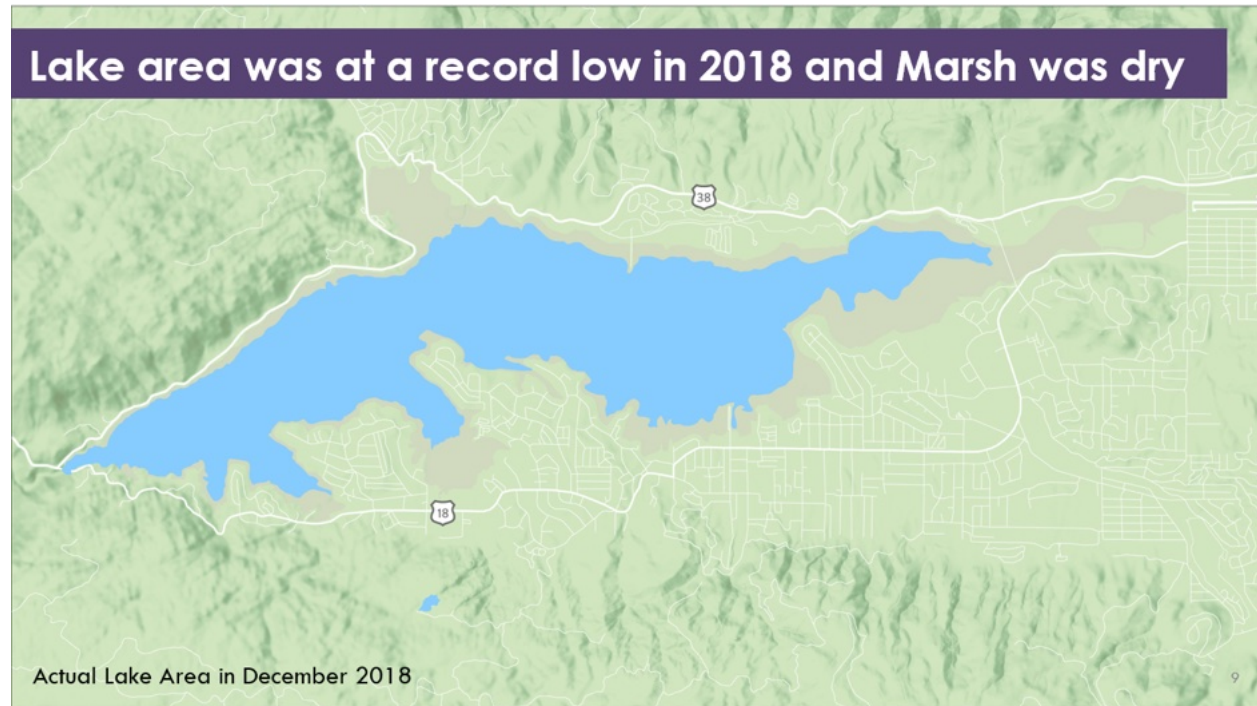

Exhibit 4.5-1: Lake Area at Record Low in 2018

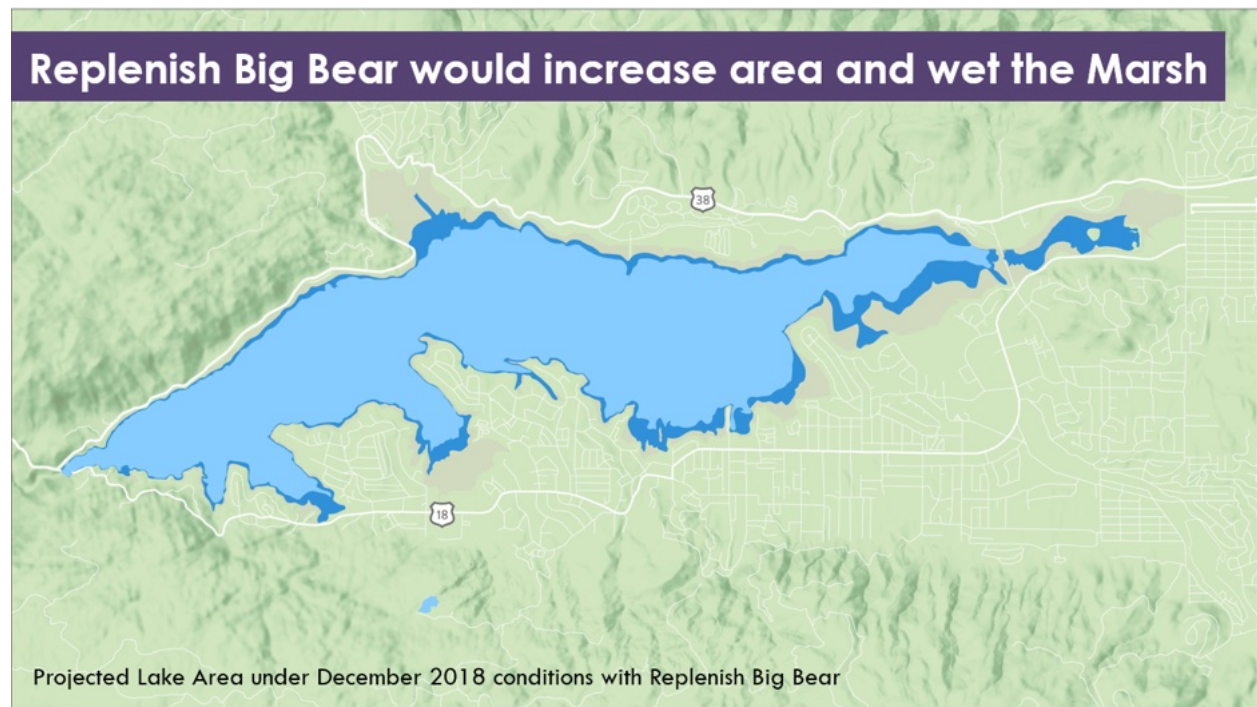

Exhibit 4.5-2: Lake Area with Program Implementation Under Dry Conditions

Beneficial Use Conclusion

As previously stated, impacts to special status species may occur if the beneficial uses listed in **Table 3-2** are obstructed as a result of the proposed Program from the discharge of purified water

to Big Bear Lake via Stanfield Marsh. Beneficial uses of Big Bear Lake and Stanfield Marsh include Wildlife Habitat (WILD)—i.e. uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources—and Rare, Threatened, or Endangered Species (RARE)—uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered. Thus, maintaining the beneficial uses of these water bodies is paramount to protecting the rare, threatened, and/or endangered species, and wildlife habitats found therein. Based on the above discussion, the Program's Water to Stanfield Marsh/Big Bear Lake would have a less than significant potential to obstruct the beneficial use of either Stanfield Marsh or Big Bear Lake with the implementation of **MM HYD-1**. Impacts would be less than significant through the implementation of mitigation. In addition, the Program's Water would help support the RARE and WILD beneficial uses simply by re-wetting the area.

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures:

To reduce or prevent activities that may adversely affect sensitive species identified in **Table 4.5-3**, above, the following **MMs** will be incorporated into any specific projects and/or contractor specifications for future project-specific impacts to protect sensitive resources and habitat.

MM BIO-1 would minimize the potential for the Solar Evaporation Ponds to impact bird-foot checkerbloom as a result of Program implementation.

BIO-1 *The Solar Evaporation Ponds shall be designed to avoid areas where bird-foot checkerbloom is known to occur (specifically, the areas that are delineated on Figure 4.5-10). The area where bird-foot checkerbloom is known to occur shall be verified by a qualified biologist prior to the commencement of construction. Orange construction fencing, or similarly visible material should be installed around the area where bird-foot checkerbloom is located, as determined by the qualified biologist, and this area shall be completely avoided as a feature of the solar evaporation pond design.*

In order to identify the extent of the bird-foot checkerbloom, and other special status species plants within a given Program component, the following measure requiring preconstruction clearance surveys shall be required.

BIO-2 *Preconstruction clearance surveys shall be conducted by a qualified biologist who is familiar with the local flora, to determine if any special status plant species are present within the proposed disturbance area prior to construction of any individual Program component. Botanical surveys shall be conducted during the appropriate time of year, when target species are both evident and identifiable.*

Should any special status plants be located within the area of potential effect (APE) during the preconstruction survey (excluding the Baldwin Lake Pipeline Option), the Implementing Agency shall fully avoid the plant(s) in accordance with the provisions of MM BIO-3 or due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, if the species is federally listed, or an Incidental Take Permit (ITP) from CDFW shall be obtained. Subject to CDFW and/or USFWS concurrence, the Implementing Agency shall mitigate the loss of the plant(s) through the purchase of mitigation credits from a CDFW-approved bank, or the acquisition and conservation of land approved by CDFW at a minimum 1:1 (replacement-to-impact) ratio.

MM BIO-3 and **BIO-4** requires orange construction fencing to be installed where special status plant species are found adjacent to a given project footprint. This measure will ensure that the bird-foot checkerbloom will be protected from construction impacts at the evaporation pond site within BBARWA's WWTP site (shown on **Figure 4.5-10**).

BIO-3 *If any listed bird-foot checkerbloom is found by the onsite biological monitor, or by construction personnel who are educated in species avoidance pursuant to MM BIO-16, within the proposed disturbance area(s), then orange construction fencing, or similarly visible material should be installed around the area where they are located, and this area shall be completely avoided. This measure applies to the Solar Evaporation Ponds Project as shown on Figure 4.5-10. This measure does not apply to the Baldwin Lake Pipeline Alignment Option, should this alignment be the selected Alignment Option. If the Baldwin Lake Pipeline Alignment Option is selected, the bird-foot checkerbloom plants shall be handled pursuant to MM BIO-5.*

BIO-4 *If any other listed special status species are found within the proposed disturbance area(s), then orange construction fencing, or similarly visible material should be installed around the area where they are located, and this area shall be completely avoided. This measure does not apply to the Baldwin Lake Pipeline Alignment Option, should this alignment be the selected alternative. If the Baldwin Lake Pipeline Alignment Option is selected, the bird-foot checkerbloom plants shall be handled pursuant to MM BIO-5.*

The Baldwin Lake Pipeline Alignment Option is being considered by BBARWA, as it would avoid a large portion of construction within residential roadways that would otherwise occur under other Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options. If the Baldwin Lake Pipeline Alignment Option is selected, **MM BIO-5** would be necessary to minimize impacts to the bird-foot checkerbloom species, but it would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option.

BIO-5 *Where feasible, the Baldwin Lake Pipeline Alignment Option shall be designed to avoid the areas within BBARWA's property where bird-foot checkerbloom is known to occur (shown on Figure 4.5-10). Otherwise, should BBARWA choose to install the Baldwin Lake Pipeline Alignment Option as it is currently proposed, BBARWA shall proceed as follows:*

- ~~• At least 20 days prior to construction within areas containing the bird-foot checkerbloom, BBARWA shall notify USFWS and CDFW of the construction plan, and potential impacts to the bird-foot checkerbloom. BBARWA shall offer USFWS and CDFW a window of 20 days to opt to collect plants and/or plant seeds prior to construction. Due to the federal involvement in the Project, Section 7 Consultation with the USFWS shall be conducted, and an Incidental Take Permit (ITP) from CDFW shall be obtained.~~
- If neither CDFW nor USFWS opt to collect plants and/or plant seeds Subject to CDFW and USFWS concurrence, with the ultimate mitigation strategy to be approved by CDFW and USFWS prior to implementation, BBARWA shall proceed with the following approach to mitigate impacts to this species:
 - BBARWA shall ~~transplant the plants~~ implement a translocation program in which the plants shall be moved out of the way during construction, and shall be watered and maintained in a holding area and then either:
 - (a) replanted over the ~~to a location where the plants can be conserved and protected outside of the~~ Baldwin Lake Pipeline Alignment Option APE. BBARWA shall establish at a minimum, an informal, but in preference, a formal

- conservation easement over the Baldwin Lake Pipeline Alignment Option APE to ensure protection of the species in perpetuity; or,
(b) replanted in BBARWA's established conservation area to protect the species in perpetuity.

The proposed Program may result in a change in water source to the Stickleback, which has a potential to significantly impact the species, if the water source lacks the nutrients necessary to support the species, or contains any constituents that, when introduced into the Stickleback habitat, would adversely impact the species. The impacts to this species have been analyzed on a more programmatic level, so that, should the individual project go forward in the future, the mitigation described below would stipulate the steps necessary to minimize impacts from changing the water source at Shay Pond. Therefore, should the Program Team ultimately decide to modify the water supply at Shay Pond, the implementation of an AMMP would ensure that the change in water source is supportive of the Stickleback and does not result in any adverse impacts to the species, as required by **MM BIO-6**, below. Furthermore, should the impacts to the Stickleback fall outside the scope of that which has been analyzed in this DPEIR, preparation of a project-specific subsequent CEQA documentation would be required. **MM BIO-6** would be required to ensure the preparation of the additional studies that will be necessary to ensure that the product water is suitable to support the Stickleback at Shay Pond. Therefore, should the Program Team ultimately modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**, below.

BIO-6 *In order to change the water source at Shay Pond, an AMMP shall be developed by BBARWA. The implementing agency—BBARWA, in association with BBCCSD—shall coordinate with USFWS and CDFW to obtain verbal agreement on the approach to forecast impacts to the Stickleback. Then, the implementing agency or biologist familiar with the Stickleback contracted to the implementing agency shall draft a MOU (that would be between BBARWA and/or BBCCSD and USFWS and/or CDFW) to lay a solid framework for the development of an AMMP. The MOU will determine if additional permitting will be required from both the State and Federal government for the take of an endangered species.*

The AMMP shall identify a sampling and monitoring program for the lifespan of the Program. This will include any triggers or adaptive management strategies that could be implemented to improve conditions for the Stickleback, including alterations to water temperature, inclusion of bubblers to increase dissolved oxygen or other techniques to be identified. The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.

As part of the MOU and AMMP implementation process, BBARWA, in association with BBCCSD shall obtain the following data to be provided to CDFW and/or USFWS:

- Data on the chemical characteristics of the Program Water to be used for the Project;
- Data on the physical characteristics of the Program Water that are likely to impact fish species, such as water temperature, dissolved oxygen, and pH;
- A comparison of water quality for the Program Water versus the groundwater currently being used to discharge to Shay Pond to ascertain if the change in water source would introduce contaminants that may impact the reproduction and survival of the stickleback.

The possible Shay Pond Replacement Pipeline (**Figures 4.5-7 through 4.5-8**) was not surveyed because the Program Team does not currently anticipate utilizing this alignment to convey water to the new Shay Pond Conveyance Pipeline. This is because BBARWA expects that the existing

pipeline that extends to Shay Pond will be sufficient in the event that this project (utilization of Program Water to replace the potable water utilized to support the Stickleback at Shay Pond) ultimately was to go forward. Additional surveys should be conducted prior to implementation of Program activities within either both the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**), to assess potential Program related impacts to special status species and habitats that may occur in these areas. In particular, to assess potential Program related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status species that may occur in this area.

MM BIO-7 would ensure that the Shay Pond Discharge Project is subject to a site-specific biological resources assessment, wherein, if sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken to avoid significant impacts to these species.

BIO-7 *Prior to implementation of the Sand Canyon Monitoring Wells (once the final locations have been selected), and prior to the replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8), a site-specific biological resources assessment shall be conducted by a qualified biologist familiar with Big Bear Valley flora and fauna. This survey shall be conducted in accordance with appropriate standards by a qualified biologist/ ecologist. If sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the CNDDDB will be notified and the following subsequent mitigation actions will be taken:*

- a. *BBARWA—The Implementing Agency shall provide compensation for sensitive habitat acreage lost by acquiring and protecting in perpetuity (through property or mitigation bank credit acquisition) habitat for the sensitive species at a ratio of not less than 1:1 for habitat lost, with the ultimate compensatory mitigation ratio being determined through negotiation with USFWS and/or CDFW, and never less than 1:1. The property acquisition shall include the presence of at least one animal or plant per animal or plant lost at the development site to compensate for the loss of individual sensitive species.*
- b. *The final mitigation may differ from the above values based on negotiations between the implementing agency and USFWS and CDFW for any incidental take permits for listed species. BBARWA and/or the implementing agency shall retain a copy of the incidental take permit as verification that the mitigation of significant biological resource impacts at a project site with sensitive biological resources has been accomplished.*
- c. *Preconstruction botanical surveys for special-status plant communities and special-status plant species will be conducted in areas that were not previously surveyed because of access or timing issues or project design changes; pre-construction surveys for special-status plant communities and special-status plant species will be conducted before the start of ground-disturbing activities during the appropriate blooming period(s) for the species. If special-status plants or plant communities are identified, the following hierarchy of actions shall be taken: a) find an alternative site; b) avoid the plants and maintain them onsite after completing the project; or c) provide compensatory mitigation offsite.*

MM BIO-8 would ensure that no sediment or pollutants enter Shay Pond/Shay Creek during construction to avoid impacts to Stickleback and its habitat, thereby protecting this species and its habitat.

BIO-8 *Appropriate BMPs (e.g., silt fence) should be implemented during construction of the Shay Pond Conveyance Pipeline to ensure that no sediment or pollutants enter Shay Pond/Shay Creek, such that construction does not impact the Stickleback and/or its habitat.*

Bald Eagle perches in the immediate vicinity of lakeshores form an essential habitat requirement for BAEA in the Big Bear Valley. Big Bear Lake and Baldwin Lake support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Program Area and given the existing human disturbance adjacent the Program site, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear Airport operations and maintenance, BAEA are not likely to nest within the Program Area. However, the proposed Solar Evaporation Ponds and Baldwin Lake Pipeline Alignment Option should be constructed when those portions of Baldwin Lake are dry, as BAEA prey (i.e., fish, waterfowl.), BAEA would be expected to be absent from the Program Area. Bald eagle may utilize lakeshore perches when Baldwin Lake is dry, but since the Program will not be removing any Baldwin lakeshore trees, the only real potential for adverse impacts to overwintering BAEA is if the construction disturbance affects their utilization of these perches for foraging on fish and waterfowl. Foraging on fish and waterfowl only occurs when Baldwin Lake is wet. Thus, if construction occurs when Baldwin Lake is dry, the use of the perches would not be affected. Thus, **MM BIO-9** is required to ensure that construction occurs under these conditions, and impacts to Bald Eagle are fully mitigated.

BIO-9 *All construction activities associated with the proposed Solar Evaporation Ponds shall be conducted when the portion of Baldwin Lake where this Program component will occur is dry.*

There is some marginally suitable rubber boa habitat in the vicinity of the Baldwin Lake Pipeline Alignment Option and there is suitable rubber boa habitat in the vicinity of the possible replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline. Also, the Sand Canyon Recharge Pipe Outlet and portions of the Sand Canyon Recharge Conveyance Pipeline are adjacent undeveloped areas of potentially suitable rubber boa habitat consisting of mixed Jeffrey pine forest and woodland and mountain juniper woodland habitats. As such, **MM BIO-10** is required to ensure that pre-construction southern rubber boa surveys are conducted to ensure avoidance of impacts to this species.

- BIO-10**
- 1. Preconstruction rubber boa surveys shall be conducted for each Program component that would provide 100% visual coverage of any undeveloped areas within the proposed Program Area footprint and would consist of a systematic ground search that would focus on moveable surface materials such as rocks, logs, duff, and man-made debris that may provide shelter for rubber boa.*
 - 2. Rubber boa exclusion fence (e.g., silt fence) shall be installed around the perimeter of the Sand Canyon Recharge Pipe Outlet construction site prior to commencement of any Program related ground disturbing activities in this area. All construction activities shall be restricted to within the fenced disturbance limits to avoid potential harm to rubber boa that may be present in nearby habitat.*
 - 3. A qualified biologist who is familiar with southern rubber boa and its habits shall be present on site during initial ground disturbing activities within or adjacent any potential rubber boa habitat to monitor the clearing/removal of any surface objects that could potentially provide rubber boa refugia or hibernacula (e.g., rotting logs/stumps, duff layer). The biological monitor shall visually inspect under any*

surface cover objects prior to their removal to ensure no rubber boa are harmed or killed.

4. *All open trenches shall be backfilled or covered at the end of the day and ramped to allow rubber boa and other wildlife to escape.*
5. *If a rubber boa is found during preconstruction presence/absence surveys or during construction activities, all site-specific project activities shall be halted, CDFW shall be contacted, and a CESA Incidental Take Permit shall be obtained from CDFW prior to reinitiating project activities.*

Although the Program Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, there is a moderate potential for flying squirrel to occur in the Program Area and species-specific impacts avoidance and minimization measures are recommended, as required by **MM BIO-11**, below.

- BIO-11**
1. *To ensure the Program does not impact flying squirrel, preconstruction surveys for each Program Component (except those occurring at the BBARWA WWTP) shall be conducted to identify potentially suitable cavity nesting sites and foraging habitat, prior to the removal of any trees or downed woody debris.*
 2. *If suitable flying squirrel cavity nesting sites are detected within the proposed Program Area footprint, then coordination with the CDFW would be necessary to determine appropriate minimization and MMs to offset Program related impacts to this species prior to the commencement of construction within the area within which the suitable flying squirrel cavity nesting sites are located.*

While the Program Area does not support the old growth montane hardwood and montane hardwood-conifer forests that SPOW typically occupy in the region, there is a minor potential for the Program to impact SPOW or flying squirrel as a result of light pollution. Therefore, to minimize impacts to these species from light pollution, the following MM shall be implemented.

- BIO-12** *To avoid potential impacts to nocturnal species such as the California Spotted Owl (SPOW) and flying squirrel, due to light pollution, project related night lighting (both temporary and permanent) shall be directed away from adjacent areas to protect nocturnal species from direct night lighting. Shielding shall be incorporated in project designs to ensure ambient lighting in adjacent areas is not increased.*

MM BIO-13 would ensure that the protective MMs provided herein are successfully implemented for the duration of construction and operation of future Program facilities, which would ensure direct and indirect impacts to the species identified under **Table 4.5-3** with a potential for the Program to affect, are minimized to the extent feasible.

- BIO-13** *During final design and prior to issuance of construction permits each specific infrastructure improvement project, a BRMP shall be prepared to:*
- *Assemble the biological resources MMs to be applied for each specific infrastructure improvement in the future;*
 - *Specify the terms and conditions from applicable permits and agreements and make provisions for monitoring assignments, scheduling, and responsibility;*
 - *Discuss habitat replacement and revegetation, protection during ground-disturbing activities, performance (growth) standards, maintenance criteria, and monitoring requirements for temporary and permanent native plant community impacts.*
 - *The parameters of the BRMP will be formed with the MMs from subsequent CEQA documentation (if required), including terms and conditions as applicable from the*

USFWS, USACE, SWRCB/RWQCB, and CDFW.

Implementation of the following **MMs BIO-14 through BIO-25** will ensure that Program-related construction impacts, both direct, and indirect, to sensitive biological resources and the species identified under **Table 4.5-2**, including the potential effects of invasive species, are reduced to a level of less than significant, except where otherwise noted herein.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on habitat values within the area.

BIO-14 **Prior to the commencement of construction within or adjacent to any natural area, and during the appropriate periods (e.g., seasons, weather conditions, times of day), a biologist/botanist shall survey the APE to identify native species (alliances, variety, and/or subspecies) within the natural areas that would be appropriate for revegetation. As part of completion of the final site development, after ground disturbance has occurred within or adjacent to any natural area, the disturbed areas shall be revegetated using a plant mix of native plant species that are suitable for long term vegetation management at the specific site as identified by the site biologist/botanist pre-construction survey, which shall be implemented in cooperation with regulatory agencies and with oversight from a biologist. The seeds mix shall be verified to contain the minimum amount of no invasive plant species seeds. If seed mix without potential invasive species does not exist for the native species to the APE, the seed mix shall contain the absolute minimum amount of invasive species reasonably available for the Program Area.**

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species.

BIO-15 *During construction, equipment will be washed before entering the project footprint to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species. Mud and plant materials will be removed from construction equipment when working in native plant communities, near special-status plant communities, or in areas where special-status plant species have been identified.*

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for special status species to be impacted during construction as a result of construction worker awareness.

BIO-16 *Personnel who work onsite will attend a Contractor Education and Environmental Training session conducted by a biologist. The environmental training will cover general and specific biological information on the special-status plant species that may be present near the construction site, including the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws.*

The Contractor Education and Environmental Training sessions will be given before the initiation of construction activities and repeated, as needed, when new personnel begin work within the project limits. Daily updates and synopsis of the training will be performed during the daily safety ("tailgate") meeting. All personnel who attend the training will be required to sign an attendance list stating that they have received the Contractor Education and Environmental Training, and such tracking sheets shall be maintained for inspection by the implementing agency.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, thereby minimizing any impacts thereof.

BIO-17 *A biological monitor shall be present during construction Activities in areas where impacts to riparian, riverine, wetland, endangered species or endangered species Critical Habitat occurs. A biological monitor (or monitors) will be present onsite during construction activities that could result in direct or indirect impacts on sensitive biological resources (including listed species) and to oversee permit compliance and monitoring efforts for all special-status resources.*

A biological monitor (biologist) is any person who has a bachelor's degree in biological sciences, zoology, botany, ecology, or a closely related field and/or has demonstrated field experience in and knowledge about the identification and life history of the special-status species or jurisdictional waters that could be affected by project activities. The biological monitor(s) will be responsible for monitoring the Contractor to ensure compliance with the Section 404 Individual Permit, Section 401 Water Quality Certification and LSA Agreements. Activities to ensure compliance would include performing construction-monitoring activities, including monitoring environmental fencing, identifying areas where special-status plant species are or may be present, and advising the Contractor of methods that may minimize or avoid impacts on these resources. Biological monitor(s) will be required to be present in all areas during ground disturbance activities and for all construction activities conducted within or adjacent to identified Environmentally Sensitive Areas, Wildlife Exclusion Fencing, and Non-Disturbance Zones as defined by the project biologist.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby habitats, thereby minimizing any impacts thereof.

BIO-18 *All food-related trash items (e.g., wrappers, cans, bottles, food scraps) will be disposed of in closed containers and removed at least once a week from the construction site.*

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species, thereby minimizing any impacts thereof.

BIO-19 *Use of rodenticides and herbicides in the project footprint will be restricted at the direction of the project biologist. This measure is necessary to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species. Where pesticides must be used, they must be used in full accordance with use instructions for the particular chemical and at the direction of the project biologist.*

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, thereby minimizing any impacts thereof.

BIO-20 *Exclusion barriers (e.g., silt fences) will be installed at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and*

Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction. The design specifications of the exclusion fencing will be determined through consultation with the USFWS and/or CDFW, as appropriate. Clearance surveys will be conducted for special-status species after the exclusion fence is installed in compliance with USFWS and/or CDFW requirements. The project biologist shall determine the frequency in which clearance surveys will be conducted to determine the efficacy of the exclusion fencing.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

BIO-21 ***Prior to the commencement of construction, the implementing agency shall identify staging areas for construction equipment to be utilized during construction that will be located outside sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridors.***

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wildlife, thereby minimize impacts thereof.

BIO-22 ***Plastic mono-filament netting (erosion-control matting) or similar material will not be used in erosion control materials to prevent potential harm to wildlife. Materials such as coconut coir matting or tackified hydroseeding compounds will be used as substitutes.***

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats that may be present outside of these established routes. This would minimize impacts to sensitive habitats and species.

BIO-23 ***During ground-disturbing activities, project-related vehicle traffic will be restricted within the construction area to established roads, construction areas, and other designated areas to prevent avoidable impacts. Access routes will be clearly flagged; traffic outside of the designated areas will be prohibited. Furthermore, the use of motorized vehicles within sensitive habitat areas and linkages shall be prohibited except for crucial maintenance and/or construction activities.***

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, and thereby minimize impacts thereof.

BIO-24 ***All excavated, steep-sided holes or trenches more than 8 inches deep will be covered at the close of each working day with plywood or similar materials, or a minimum of one escape ramp constructed of earth fill for every 10 feet of trenching will be provided to prevent the entrapment of wildlife. Before such holes or trenches are filled, they will be thoroughly inspected for trapped animals. All culverts or similar enclosed structures with a diameter of 4 inches or greater will be covered, screened, or stored more than 1 foot off the ground to prevent use by wildlife. Stored material will be cleared for common and special-status wildlife species before the pipe is subsequently used or moved.***

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, thereby minimizing impacts thereof.

BIO-25 ***Prior to the commencement of construction, a Weed Control Plan will be developed for the implementing agency by the project biologist to minimize or avoid the spread of***

weeds during ground-disturbing activities. In the Weed Control Plan, the following topics will be addressed:

- *A Schedule for noxious weed surveys shall be addressed.*
- *Weed control treatments shall be addressed and ultimately implemented by the implementing agency, including permitted herbicides, and manual and mechanical methods for application; herbicide application will be restricted in Environmentally Sensitive Areas (as defined by the project biologist).*
- *The timing of the weed control treatment for each plant species shall be addressed.*
- *Fire prevention measures shall be addressed.*

The implementing agency shall maintain records demonstrating implementation of the Weed Control Plan, and shall make those records available to inspection by the implementing agency upon request.

MM HYD-1 is required to ensure that monitoring and adaptive mitigation is implemented to protect to beneficial uses of Stanfield Marsh and Big Bear Lake, minimizing impacts to the RARE and WILD designations thereof. This would ensure that the protection of special status habitats and species extended as part of the beneficial use of these water bodies, would be maintained, thereby minimizing potential impacts thereof.

HYD-1 *BBARWA, in collaboration with BBMWD and BBCCSD, will collect samples at the pertaining locations. That is BBARWA will monitor the Program Water, BBMWD will collect samples in the Stanfield Marsh and Big Bear Lake, and BBCCSD will collect samples in Shay Pond. BBARWA will develop the AAMP and will coordinate with BBMWD and BBCCSD to implement the AMMP for the proposed discharges to Stanfield Marsh/Big Bear Lake and Shay Pond (when implemented). The AMMP will consist of the following;*

- *Conduct a monitoring plan to:*
 - *Collect quarterly boron samples of Program Water (i.e., purified water before it is discharged to Stanfield Marsh or Shay Pond (when implemented)), at the existing TMDL Sampling Station MWDL9, and at Shay Pond (when implemented);*
 - *Monitor the dissolved oxygen and pH of the Program Water, in Stanfield Marsh (if permitted), at the existing TMDL Sampling Station MWDL9, and at Shay Pond (when implemented) during and after re-wetting of Stanfield Marsh or Shay Pond;*
 - *Continuously monitor temperature of the Program Water, Stanfield Marsh, and Shay Pond (when implemented); and*
 - *Collect quarterly chloride samples of Program Water stored in Big Bear Lake at the existing TMDL Sampling Station MWDL9 to assess the impacts on the Bear Valley Basin.*
 - *Collect nutrient (i.e., TIN, TP, TN, ammonia, nitrate as N, nitrite as N) samples of the Program Water at the frequency stated in the NPDES permit.*
- *Implement a TP Offset Program, expected to be stipulated in BBARWA's future NPDES permit;*
- *Monitor the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake on at least a bi-yearly basis. If observed, mitigative actions, such as invasive plant removal, introduction of native species known to eradicate invasive species, or other mitigative actions shall be undertaken to remove the invasive species present as a result of introduction of the Program Water. An account of invasive species within Stanfield Marsh and Big Bear Lake shall be undertaken prior to discharge into Stanfield Marsh to set a baseline for what invasive species exist prior to operation of the Program.*

If temperature, dissolved oxygen, boron, or pH levels exceed the NPDES permit requirements, BBARWA shall pursue mitigation actions which may include, but are not limited to the following:

- *Introduction of chemical or mechanical intervention to stabilize pH levels and dissolved oxygen.*

- **Introduction of native plants to absorb boron at Stanfield Marsh or Shay Pond (when implemented).**
- **Introduction of a temperature cooling mechanism to lower the temperature of the Program Water before being introduced to the Stanfield Marsh or Shay Pond (when implemented).**

If recharging Program Water stored in Big Bear Lake would result in exceedance of any of the limits set in the future Sand Canyon Recharge Area WDR permit, the discharge of Program Water to the Sand Canyon Recharge Area would be paused until permit conditions are met.

The AMMP shall be aligned with the future requirements of the NPDES and WDR permits.

Level of Significance After Mitigation: Significant and Unavoidable

Impacts to all species identified under **Table 4.5-3**—specifically, to BAEA, southern rubber boa, and San Bernardino flying squirrel—can be avoided through implementation of **MMs BIO-9** through **BIO-25** and **HYD-1**, with the exception of impacts to the bird-foot checkerbloom. As discussed above, impacts to the bird-foot checkerbloom, which is a Federally and State designated endangered plant species, would be potentially significant and unavoidable. While **MMs BIO-1** through **BIO-4** would minimize impacts to bird-foot checkerbloom from construction of the Solar Evaporation Ponds to a level of less than significant, **MM BIO-5** would not fully mitigate adverse impacts to the bird-foot checkerbloom species, and as such, a significant impact on this species may occur as a result of selecting the Baldwin Lake Pipeline Alignment Option.

Impacts to the Stickleback have not been fully analyzed herein, as the implementation of the Shay Pond Discharge Project has been tabled by the Program Team for the foreseeable future. As such, if the Program Team envisions utilizing the purified water generated by the AWPf proposed by this Program, a follow-on environmental determination shall fully assess these impacts. Furthermore, the provisions of **MM BIO-6** shall be followed to ensure that the proper procedure is followed to determine how the use of purified water generated by the AWPf would impact these species, in cooperation with the regulatory agencies (CDFW and USFWS) governing the protection of this species.

Additional surveys must be conducted prior to implementation of Program activities within both the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**) to assess potential Program related impacts to special status species and habitats that may occur in these areas. In particular, to assess potential Program related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status species that may occur in this area, because as with the impacts to the Stickleback, the habitat within the Shay Pond Replacement Pipeline has not been fully analyzed as the implementation of the Shay Pond Discharge Project has been tabled by the Program Team for the foreseeable future. Implementation of **MM BIO-7** and **BIO-8** would ensure that impacts from installation of the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline would be minimized to a level of less than significant.

Cumulative Impact Analysis

Cumulative development within the Big Bear Valley includes conversion of open undeveloped land to urban and rural development. This future cumulative development has the potential to reduce the availability of suitable habitat for special-status species. To mitigate the effects of the cumulative impacts on special status species and habitat values from implementation of the proposed Program, MMs identified above would ensure that Program related impacts on all

special status species would be minimized to a level of less than significant, except for the Program impacts on the bird-foot checkerbloom.

There are other areas within the overall Program Area of potential impact where the resource impacts from constructing new infrastructure may cause unavoidable significant adverse impacts on biological resources. These areas are highly dependent upon the final design of each Program facility, i.e., individual project, and if those actions cannot be reasonably or feasibly offset, the ultimate design of these Program improvements must be based on sound engineering. In each case where most environmental impacts cannot be fully avoided, it may be possible to avoid certain impacts by designs that avoid such impacts through sound mitigation-based planning at each step. Given the speculative nature of the locations of proposed Program facilities, there is a potential that an individual Program facility may be developed and have operations within an area containing biological resources that cannot be avoided, even at the design level. This is anticipated to be the case for the bird-foot checkerbloom.

The loss of potentially suitable habitat for special-status species as a result of cumulative development would primarily result from the total conversion of undeveloped land to urban and rural development. This potential conversion by cumulative development is considered a potentially significant impact on special-status species. Since the Program would also result in potentially significant impacts on special-status species, the Program's contribution is considered cumulatively considerable, however, for all species identified in **Table 4.5-3**, except the bird-foot checkerbloom, the Program's contributions to cumulatively considerable significant impacts under this issue, can be mitigated to a level of less than cumulatively considerable. Regardless, impacts to the bird-foot checkerbloom are forecast to potentially experience an unavoidable cumulatively significant impact if the Baldwin Lake Pipeline Alignment Option is selected as the preferred Lake Discharge Alignment. Thus, a cumulatively significant impact may result.

*Cumulative Measures: **MMs BIO-1 through BIO-25** are required to minimize cumulative impacts on special status species to the greatest extent feasible.*

Level of Significance After Mitigation: Cumulatively Significant

b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS?

Critical habitat has been designated for several species adjacent to, directly overlapping, or in the general vicinity of the Program Area. As discussed under **Subsection 4.5.3.1.3**, several special status habitats have been documented in the Program vicinity (within approximately three miles) including pebble plains, southern California threespine stickleback stream, and USFWS designated Critical Habitat for several Federally listed threatened or endangered species. There is no pebble plain or pebble plain-like habitat within the entirety of the proposed Program Area footprint.

As biological resource impacts are highly site dependent, the following discussion analyzes the potential impacts to sensitive habitats on each project site location. These locations are:

- **BBARWA WWTP Upgrades Project**
 - BBARWA WWTP Upgrades
- **Solar Evaporation Ponds Project**
 - Solar Evaporation Ponds at the BBARWA WWTP Site
- **Sand Canyon Recharge Project**
 - Sand Canyon Recharge Conveyance Pipeline

- Sand Canyon Conveyance Pipeline Discharge Outlet
- Sand Canyon Booster Station
- Sand Canyon Monitoring Wells (locations unknown)
- **Shay Pond Discharge Project**
 - Shay Pond Replacement Pipeline
 - Shay Pond Conveyance Pipeline Alignment
- **Stanfield Marsh/Big Bear Lake Discharge Project**
 - Stanfield Marsh Conveyance Pipeline Discharge Outlets
 - Alignment Option 1 to Discharge Point 1
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option
 - Alignment Option 2 to Discharge Point 2
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option

BBARWA WWTP Upgrades Project

The nearest USFWS designated Critical Habitat units to this Program Component are adjacent the east side of the BBARWA WWTP and adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option, respectively. The Critical Habitat unit adjacent the east side of the BBARWA WWTP site consists of the North Shay Meadow USFWS designated Critical Habitat unit (Unit 6) for the Federally listed as endangered California dandelion. The Critical Habitat unit adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option consists of the Pan Hot Springs Meadow USFWS designated Critical Habitat unit (Unit 1) for the Federally listed as endangered San Bernardino blue grass and California dandelion. However, no portion of the proposed Program Component footprint is within these Critical Habitat units, or any other Critical Habitat. Therefore, the BBARWA WWTP Upgrades Project will not result in the loss or adverse modification of USFWS designated Critical Habitat. Impacts would be less than significant.

Solar Evaporation Ponds Project

The nearest USFWS designated Critical Habitat units to this Program Component are adjacent the east side of the Solar Evaporation Ponds site and adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option, respectively. The Critical Habitat unit adjacent the east side of the BBARWA WWTP and Solar Evaporation Ponds site consists of the North Shay Meadow USFWS designated Critical Habitat unit (Unit 6) for the Federally listed as endangered California dandelion. The Critical Habitat unit adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option consists of the Pan Hot Springs Meadow USFWS designated Critical Habitat unit (Unit 1) for the Federally listed as endangered San Bernardino blue grass and California dandelion. However, no portion of the proposed Program Component footprint is within these Critical Habitat units, or any other Critical Habitat. Therefore, the Solar Evaporation Ponds Project will not result in the loss or adverse modification of USFWS designated Critical Habitat. Impacts would be less than significant.

Sand Canyon Recharge Project

The nearest USFWS designated Critical Habitat units to this Program Component are adjacent the east side of the BBARWA site and adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option, respectively. No portion of the proposed Program Component footprint is within these Critical Habitat units, or any other Critical Habitat. Therefore, the Solar Evaporation Ponds Project will not result in the loss or adverse modification of USFWS designated Critical Habitat. Impacts would be less than significant.

Shay Pond Discharge Project

There is southern California threespine stickleback stream habitat within the Shay Pond Conveyance Pipeline alignment and possible Shay Pond Replacement Pipeline. However, BBARWA expects that the existing pipeline that extends from the BBARWA WWTP to Shay Pond, which is presently not in use, will be sufficient to convey Program Water from the AWPf at BBARWA's WWTP to the proposed short length of pipeline to Shay Pond Conveyance Pipeline (**Figures 4.5-7 through 4.5-8**). As a replacement pipeline is not anticipated to be necessary from the AWPf at the BBARWA WWTP to Shay Pond, the conveyance pipeline was not surveyed. Furthermore, as this replacement pipeline alignment would not be installed in the near-term future (due to the regulatory requirements related to changing the water source at Shay Pond), BBARWA anticipates that surveys of this replacement pipeline alignment would better reflect current conditions if performed within a more proximate timeframe to construction, should this Program component be necessary. Additionally, the proposed footprint of the Shay Pond Conveyance Pipeline is entirely within existing unpaved roadway and upland. The Program could increase the amount of water supplied to Shay Pond from the current 50 AFY to an anticipated maximum of 80 AFY, which, if the amount of water supplied to Shay Pond was increased, it could enhance Stickleback habitat conditions in Shay Pond and potentially, the downstream portion of Shay Creek. Therefore, the Program would not result in any loss or adverse modification pebble plains or southern California threespine stickleback stream. However, additional surveys must be conducted prior to implementation of Program activities within the Shay Pond Replacement Pipeline (**Figures 4.5-7 through 4.5-8**) to assess potential project-related impacts to special status habitats that may occur in the Program Area. Therefore, without **MMs BIO-6 through BIO-8**, a significant impact to the southern California threespine stickleback stream habitat could occur. Implementation of **MM BIO-7** and **BIO-8** would ensure that impacts to critical habitat, riparian habitat or other sensitive natural communities from installation of the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline would be minimized to a level of less than significant.

As such, implementation of **MM BIO-6 through BIO-8** are necessary to minimize impacts to southern California threespine stickleback stream habitat from Program implementation. Impacts would be less than significant with the implementation of mitigation.

Stanfield Marsh/Big Bear Lake Discharge Project

The nearest USFWS designated Critical Habitat units are adjacent the east side of the BBARWA WWTP and adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option, respectively. The Critical Habitat unit adjacent the east side of the BBARWA WWTP site consists of the North Shay Meadow USFWS designated Critical Habitat unit (Unit 6) for the Federally listed as endangered California dandelion. The Critical Habitat unit adjacent the north side of the proposed Baldwin Lake Pipeline Alignment Option consists of the Pan Hot Springs Meadow USFWS designated Critical Habitat unit (Unit 1) for the Federally listed as endangered San Bernardino blue grass and California dandelion. However, no portion of the proposed Program Area footprint is within these Critical Habitat units, or any other Critical Habitat. Therefore, the Program will not result in the loss or adverse modification of USFWS designated Critical Habitat. Impacts would be less than significant.

Other Physical Changes to the Environment

No physical changes beyond that which presently occurs or could occur under the existing conditions at the LV Site are proposed by the Program. As such, no biological resources, including critical habit, of which none exists at the LV Site, are expected to be directly or indirectly impacted by the reduced discharge to the LV Site that would occur as a result of Program implementation.

Level of Significance Before Mitigation: Potentially Significant

*Mitigation Measures: **MMs BIO-6 through BIO-8** are necessary to minimize impacts to southern California threespine stickleback stream habitat from Program implementation.*

BIO-6 *In order to change the water source at Shay Pond, an AMMP shall be developed by BBARWA. The implementing agency—BBARWA, in association with BBCCSD—shall coordinate with USFWS and CDFW to obtain verbal agreement on the approach to forecast impacts to the Stickleback. Then, the implementing agency or biologist familiar with the Stickleback contracted to the implementing agency shall draft a MOU (that would be between BBARWA and/or BBCCSD and USFWS and/or CDFW) to lay a solid framework for the development of an AMMP. The MOU will determine if additional permitting will be required from both the State and Federal government for the take of an endangered species.*

The AMMP shall identify a sampling and monitoring program for the lifespan of the Program. This will include any triggers or adaptive management strategies that could be implemented to improve conditions for the Stickleback, including alterations to water temperature, inclusion of bubblers to increase dissolved oxygen or other techniques to be identified. The AMMP must be approved by USFWS and CDFW in order to carry out a pilot study in which it will be determined whether the change in water source for the Stickleback is feasible.

As part of the MOU and AMMP implementation process, BBARWA, in association with BBCCSD shall obtain the following data to be provided to CDFW and/or USFWS:

- Data on the chemical characteristics of the Program Water to be used for the Project;*
- Data on the physical characteristics of the Program Water that are likely to impact fish species, such as water temperature, dissolved oxygen, and pH;*
- A comparison of water quality for the Program Water versus the groundwater currently being used to discharge to Shay Pond to ascertain if the change in water source would introduce contaminants that may impact the reproduction and survival of the stickleback.*

BIO-7 *Prior to implementation of the Sand Canyon Monitoring Wells (once the final locations have been selected), and prior to the replacement pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline and the new Shay Pond Conveyance Pipeline (Figures 4.5-7 through 4.5-8), a site-specific biological resources assessment shall be conducted by a qualified biologist familiar with Big Bear Valley flora and fauna. This survey shall be conducted in accordance with appropriate standards by a qualified biologist/ ecologist. If sensitive species are identified as a result of the survey for which mitigation/compensation must be provided in accordance with regulatory requirements, the California Natural Diversity Database (CNDDDB) will be notified and the following subsequent mitigation actions will be taken:*

- a. BBARWA—The Implementing Agency shall provide compensation for sensitive habitat acreage lost by acquiring and protecting in perpetuity (through property or mitigation bank credit acquisition) habitat for the sensitive species at a ratio of not less than 1:1 for habitat lost, with the ultimate compensatory mitigation ratio being determined through negotiation with USFWS and/or CDFW, and never less than 1:1. The property acquisition shall include the presence of at least one animal or plant per animal or plant lost at the development site to compensate for the loss of individual sensitive species.*
- b. The final mitigation may differ from the above values based on negotiations between the project proponent and USFWS and CDFW for any incidental take permits for listed species. BBARWA and/or the implementing agency shall retain a copy of the incidental take permit as verification that the mitigation of significant biological*

resource impacts at a project site with sensitive biological resources has been accomplished.

- c. *Preconstruction botanical surveys for special-status plant communities and special-status plant species will be conducted in areas that were not previously surveyed because of access or timing issues or project design changes; pre-construction surveys for special-status plant communities and special-status plant species will be conducted before the start of ground-disturbing activities during the appropriate blooming period(s) for the species. If special-status plants or plant communities are identified, the following hierarchy of actions shall be taken: a) find an alternative site; b) avoid the plants and maintain them onsite after completing the project; or c) provide compensatory mitigation offsite.*

BIO-8 *Appropriate BMPs (e.g., silt fence) should be implemented during construction of the Shay Pond Conveyance Pipeline to ensure that no sediment or pollutants enter Shay Pond/Shay Creek, such that construction does not impact the Stickleback and/or its habitat.*

Level of Significance After Mitigation: Less Than Significant

The proposed Program may result in a change in water source to the Stickleback, which has a potential to significantly impact the species, if the water source lacks the nutrients necessary to support the species, or contains any constituents that, when introduced into the Stickleback habitat, would adversely impact the species. The impacts to this species have been analyzed on a more programmatic level, so that, should the individual project go forward in the future, the mitigation described below would stipulate the steps necessary to minimize impacts from changing the water source at Shay Pond. Therefore, should the Program Team ultimately decide to modify the water supply at Shay Pond, the impacts shall be fully analyzed through the implementation of an AMMP, as required by **MM BIO-6**. **MM BIO-6** would ensure that impacts to critical habitat, riparian habitat or other sensitive natural communities from the change in water source at Shay Pond would be minimized to a level of less than significant.

Furthermore, as discussed under issue (a), above, implementation of **MMs BIO-7** and **BIO-8** would ensure that impacts to critical habitat, riparian habitat or other sensitive natural communities from installation of the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline would be minimized to a level of less than significant.

Cumulative Impact Analysis

Implementation of cumulative development within the Big Bear Valley could result in potential impacts to riparian habitat and special status natural communities. Cumulative development could encroach into areas adjacent to existing drainages and creeks that could contain riparian habitat. In addition, cumulative development could result in potential impacts on riparian habitat. Certain areas within the Big Bear Valley that contain critical habitat for species may not be fully mitigable, and an unavoidable significant adverse biological resource impact may occur. As project specific impacts on critical habitat, riparian habitat or other sensitive natural communities are less than significant with mitigation, the project-specific impacts to critical habitat, riparian habitat or other sensitive natural communities would not be substantial enough to contribute cumulatively considerable contributions to significant adverse impacts thereof. Thus, the Program's contribution to cumulative impacts would be less than cumulatively considerable.

*Cumulative Measures: **MMs BIO-6, BIO-7, and BIO-8** are required to minimize direct and indirect cumulative effects to riparian habitat or other sensitive natural communities.*

Level of Significance After Mitigation: Less Than Significant

- c) **Would the project have a substantial adverse effect on Federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Direct impacts on natural and man-made features include the removal or modification of local hydrology, the redirection of flow, and the placement of fill material. In the case of man-made features, these impacts would remove or disrupt the limited biological functions that these features provide. In natural areas, these activities would remove or disrupt the hydrology, vegetation, wildlife use, water quality conditions, and other biological functions provided by the resources.

Temporary impacts on jurisdictional waters include the placement of temporary fill during construction in both man-made and natural jurisdictional waters. Temporary fill could be placed during the construction of access roads and staging/equipment storage areas. The temporary fill would result in a temporary loss of jurisdictional waters and could potentially increase erosion and sediment transport into adjacent areas.

Potential indirect impacts on jurisdictional waters include a number of water-quality-related impacts: erosion and transport of fine sediments or fill downstream of construction to unintentional release of contaminants into jurisdictional waters that are outside of the project footprint. These discharges would indirectly impact adjacent or downstream jurisdictional waters.

As wetland impacts are highly site dependent, the following discussion analyzes the potential impacts to sensitive habitats on each project site location. These locations are:

- **BBARWA WWTP Upgrades Project**
 - BBARWA WWTP Upgrades
- **Solar Evaporation Ponds Project**
 - Solar Evaporation Ponds at the BBARWA WWTP Site
- **Sand Canyon Recharge Project**
 - Sand Canyon Recharge Conveyance Pipeline
 - Sand Canyon Conveyance Pipeline Discharge Outlet
 - Sand Canyon Booster Station
 - Sand Canyon Monitoring Wells (locations unknown)
- **Shay Pond Discharge Project**
 - Shay Pond Replacement Pipeline
 - Shay Pond Conveyance Pipeline Alignment
- **Stanfield Marsh/Big Bear Lake Discharge Project**
 - Stanfield Marsh Conveyance Pipeline Discharge Outlets
 - Alignment Option 1 to Discharge Point 1
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option
 - Alignment Option 2 to Discharge Point 2
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option

BBARWA WWTP Upgrades Project

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to

authorize the discharge of dredged or fill material into Waters of the U.S. are: a nation-wide permit (NWP) or an individual permit (IP). NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources. The discharge must not cause the loss of greater than 1/2 acre to Waters of the U.S., including the loss of no more than 300 LF of streambed. Projects proposed under this Program that would exceed these limits would likely require an IP. If the USACE 404 Permit requirements were not met by Program implementation, a significant impact under this issue could occur. Based on the type of site modifications proposed as part of the BBARWA WWTP Upgrades Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. Therefore, no impacts related to compliance with a USACE 404 Permit would be anticipated.

Regional Water Quality Control Board 401 Certification

The Program Area in the Big Bear Valley is within the jurisdiction of the Santa Ana Regional Board. Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into Waters of the U.S. does not violate State water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter-Cologne Act through issuance of a CGP, State General WDR, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application. If the RWQCB 401 Certification requirements were not met by Program implementation, a significant impact under this issue could occur. However, based on the type of site modifications proposed as part of the BBARWA WWTP Upgrades Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring CWA Section 401 Water Quality Certification would be required. Therefore, no impacts related to compliance with the CWA Section 401 Water Quality Certification would be anticipated.

FGC Section 1602 Lake or Streambed Alteration Agreement

An FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application. In addition to the BRA field survey, Jacobs also assessed the proposed Program Area footprint for the presence of any State and/or Federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (**Figure 4.5-11**). Any potential Program impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Program Components that may impact State and/or Federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Program related impacts to aquatic resources and the appropriate regulatory permitting (if any) required. If the FGC Section 1602 LSA Agreement requirements were not met by Program implementation, a significant impact under this issue could occur. In the case of the BBARWA WWTP Upgrades Project, the BBARWA WWTP site area that would be impacted has been completely developed, and therefore, it is not anticipated that an FGC Section 1602 LSA Agreement would be required. Therefore, no impacts related to compliance with the FGC Section 1602 would be anticipated.

Solar Evaporation Ponds Project

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into Waters of the U.S. are: a NWP or IP. NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic

resources. The discharge must not cause the loss of greater than 1/2 acre to Waters of the U.S., including the loss of no more than 300 LF of streambed. Projects proposed under this Program that would exceed these limits would likely require an IP. If the USACE 404 Permit requirements were not met by Program implementation, a significant impact under this issue could occur. Based on the type of site modifications proposed as part of the BBARWA WWTP Upgrades Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. Therefore, no impacts related to compliance with a USACE 404 Permit would be anticipated.

Regional Water Quality Control Board 401 Certification

The Program Area in the Big Bear Valley is within the jurisdiction of the Santa Ana Regional Board. Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into Waters of the U.S. does not violate State water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter-Cologne Act through issuance of a CGP, State General WDR, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application. If the RWQCB 401 Certification requirements were not met by Program implementation, a significant impact under this issue could occur. However, based on the type of site modifications proposed as part of the Solar Evaporation Ponds Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring CWA Section 401 Water Quality Certification would be required. Therefore, no impacts related to compliance with the CWA Section 401 Water Quality Certification would be anticipated.

Waste discharges that can be exempted from the California Code of Regulations requirements are issued WDRs and are regulated by the WDR Program. Typical discharge types include domestic or municipal wastewater, food processing related wastewater, and industrial wastewater. Thus, the actions proposed by the Solar Evaporation Ponds Project is anticipated to require a WDR issued by the RWQCB. This is a mandatory requirement that does not require mitigation to ensure compliance. Thus, impacts related to compliance with RWQCB WDR requirements from implementation of the Solar Evaporation Ponds Project would be less than significant.

FGC Section 1602 Lake or Streambed Alteration Agreement

An FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application. In addition to the BRA field survey, Jacobs also assessed the proposed Program Area footprint for the presence of any State and/or Federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (**Figure 4.5-11**). Any potential Program impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Program Components that may impact State and/or Federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Program related impacts to aquatic resources and the appropriate regulatory permitting (if any) required. If the FGC Section 1602 LSA Agreement requirements were not met by Program implementation, a significant impact under this issue could occur. Baldwin Lake is a water of the State of California, and as the Solar Evaporation Ponds would be installed within Baldwin Lake, potential Program impacts to aquatic resources from implementation of this project would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. **MM BIO-26** would ensure that jurisdictional features are documented in

accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on wetlands within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species that could impact wetlands.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for wetlands to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, including wetlands thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby wetlands habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of wetlands, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, and movement adjacent to the construction area that could impact wetlands, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, mitigation is required to minimize impacts to a level of less than significant.

Sand Canyon Recharge Project

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into Waters of the U.S. are: a NWP or an IP. NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources. The discharge must not cause the loss of greater than 1/2 acre to Waters of the U.S., including the loss of no more than 300 LF of streambed. Projects proposed under this Program that would exceed these limits would likely require an IP. If the USACE 404 Permit requirements were not met by Program implementation, a significant impact under this issue could occur. Based on the type of site modifications proposed as part of the Sand Canyon Recharge Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. Therefore, no impacts related to compliance with a USACE 404 Permit would be anticipated.

Regional Water Quality Control Board 401 Certification

The Program Area in the Big Bear Valley is within the jurisdiction of the Santa Ana Regional Board. Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into Waters of the U.S. does not violate State water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter-Cologne Act through issuance of a CGP, State General WDR, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application. If the RWQCB 401 Certification requirements were not met by Program implementation, a significant impact under this issue could occur. However, based on the type of site modifications proposed as part of the Sand Canyon Recharge Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring CWA Section 401 Water Quality Certification would be required. Therefore, no impacts related to compliance with the CWA Section 401 Water Quality Certification would be anticipated.

Waste discharges that can be exempted from the California Code of Regulations requirements are issued WDRs and are regulated by the WDR Program. Typical discharge types include domestic or municipal wastewater, food processing related wastewater, and industrial wastewater. Thus, the actions proposed by the Sand Canyon Conveyance Pipeline Discharge Outlet is anticipated to require a WDR issued by the RWQCB. This is a mandatory requirement that does not require mitigation to ensure compliance. Thus, impacts related to compliance with

RWQCB WDR requirements from implementation of the Sand Canyon Conveyance Pipeline Discharge Outlet would be less than significant.

FGC Section 1602 Lake or Streambed Alteration Agreement

An FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application. In addition to the BRA field survey, Jacobs also assessed the proposed Program Area footprint for the presence of any State and/or Federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (**Figure 4.5-11**). Any potential Program impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Program Components that may impact State and/or Federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Program related impacts to aquatic resources and the appropriate regulatory permitting (if any) required. If the FGC Section 1602 LSA Agreement requirements were not met by Program implementation, a significant impact under this issue could occur. The Sand Canyon Channel is a water of the State of California, and as the Sand Canyon Conveyance Pipeline Discharge Outlet would outlet to the Sand Canyon Channel, potential Program impacts to aquatic resources from implementation of this project would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on wetlands within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species that could impact wetlands.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for wetlands to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, including wetlands thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby wetlands habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of wetlands, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, and movement adjacent to the construction area that could impact wetlands, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, mitigation is required to minimize impacts to a level of less than significant.

Shay Pond Discharge Project

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into Waters of the U.S. are: a NWP or IP. NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources. The discharge must not cause the loss of greater than 1/2 acre to Waters of the U.S., including the loss of no more than 300 LF of streambed. Projects proposed under this Program that would exceed these limits would likely require an IP. If the USACE 404 Permit requirements were not met by Program implementation, a significant impact under this issue could occur. Based on the type of site modifications proposed as part of the Shay Pond Discharge Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. Therefore, no impacts related to compliance with a USACE 404 Permit would be anticipated.

Regional Water Quality Control Board 401 Certification

The Program Area in the Big Bear Valley is within the jurisdiction of the Santa Ana Regional Board. Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into Waters of the U.S. does not violate State water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter-Cologne Act through issuance of a CGP, State General WDR, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application. If the RWQCB 401 Certification requirements were not met by Program implementation, a significant impact under this issue could occur. However, based on the type of site modifications proposed as part of the Shay Pond Discharge Project, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring CWA Section 401 Water Quality Certification would be required. Therefore, no impacts related to compliance with the CWA Section 401 Water Quality Certification would be anticipated.

Waste discharges that can be exempted from the California Code of Regulations requirements are issued WDRs and are regulated by the WDR Program. Typical discharge types include domestic or municipal wastewater, food processing related wastewater, and industrial wastewater. Thus, the actions proposed by the Shay Pond Conveyance Pipeline Discharge Outlet and Shay Pond Replacement Pipeline are anticipated to require a WDR issued by the RWQCB. This is a mandatory requirement that does not require mitigation to ensure compliance. Thus, impacts related to compliance with RWQCB WDR requirements from implementation of the Shay Pond Conveyance Pipeline Discharge Outlet and Shay Pond Replacement Pipeline would be less than significant.

FGC Section 1602 Lake or Streambed Alteration Agreement

An FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application. In addition to the BRA field survey, Jacobs also assessed the proposed Program Area footprint for the presence of any State and/or Federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (**Figure 4.5-11**). Any potential Program impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Program Components that may impact State and/or Federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Program related impacts to aquatic resources and the appropriate regulatory permitting (if any) required. If the FGC Section 1602 LSA Agreement requirements were not met by Program implementation, a significant impact under this issue could occur. Shay Pond is a water of the State of California, and as the Shay Pond Conveyance Pipeline Discharge Outlet would be installed to discharge into Shay Pond, potential Program impacts to aquatic resources from implementation of this project would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could

affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on wetlands within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species that could impact wetlands.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for wetlands to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, including wetlands thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby wetlands habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of wetlands, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, and movement adjacent to the construction area that could impact wetlands, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, mitigation is required to minimize impacts to a level of less than significant.

Caribou Creek is a water of the State of California, and as the Shay Pond Replacement Pipeline traverses through Caribou Creek, potential Program impacts to aquatic resources from implementation of this project would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Thus, mitigation (**MM BIO-14 through BIO-25, BIO-26 and BIO-27**) is required to minimize impacts to a level of less than significant.

Stanfield Marsh/Big Bear Lake Discharge Project

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into Waters of the U.S. are: a NWP or IP. NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources. The discharge must not cause the loss of greater than 1/2 acre to Waters of the U.S., including the loss of no more than 300 LF of streambed. Projects proposed under this Program that would exceed these limits would likely require an IP. If the USACE 404 Permit requirements were not met by Program implementation, a significant impact under this issue could occur.

Based on the type of site modifications proposed as part of the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. However, as the Stanfield Marsh Conveyance Pipeline Discharge Outlet(s) is a part of this Project, and, based on the design of this project, it is known that discharge to Waters of the U.S. will occur. Thus, as discharge to Waters of the U.S. are anticipated to occur as a result of the Stanfield Marsh Conveyance Pipeline Discharge Outlet discharge of Program Water to Stanfield Marsh, impacts to Waters of the U.S. may occur and a USACE 404 Permit is likely to be required. Thus, mitigation is required to minimize impacts to a level of less than significant. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with State and Federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of State or Federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on wetlands within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species that could impact wetlands.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for wetlands to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, including wetlands thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby wetlands habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of wetlands, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, and movement adjacent to the construction area that could impact wetlands, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, through the implementation of the above mitigation measures, impacts would be less than significant.

Regional Water Quality Control Board 401 Certification

The Program Area in the Big Bear Valley is within the jurisdiction of the Santa Ana Regional Board. Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or

fill material into Waters of the U.S. does not violate State water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter-Cologne Act through issuance of a CGP, State General WDR, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application. If the RWQCB 401 Certification requirements were not met by Program implementation, a significant impact under this issue could occur.

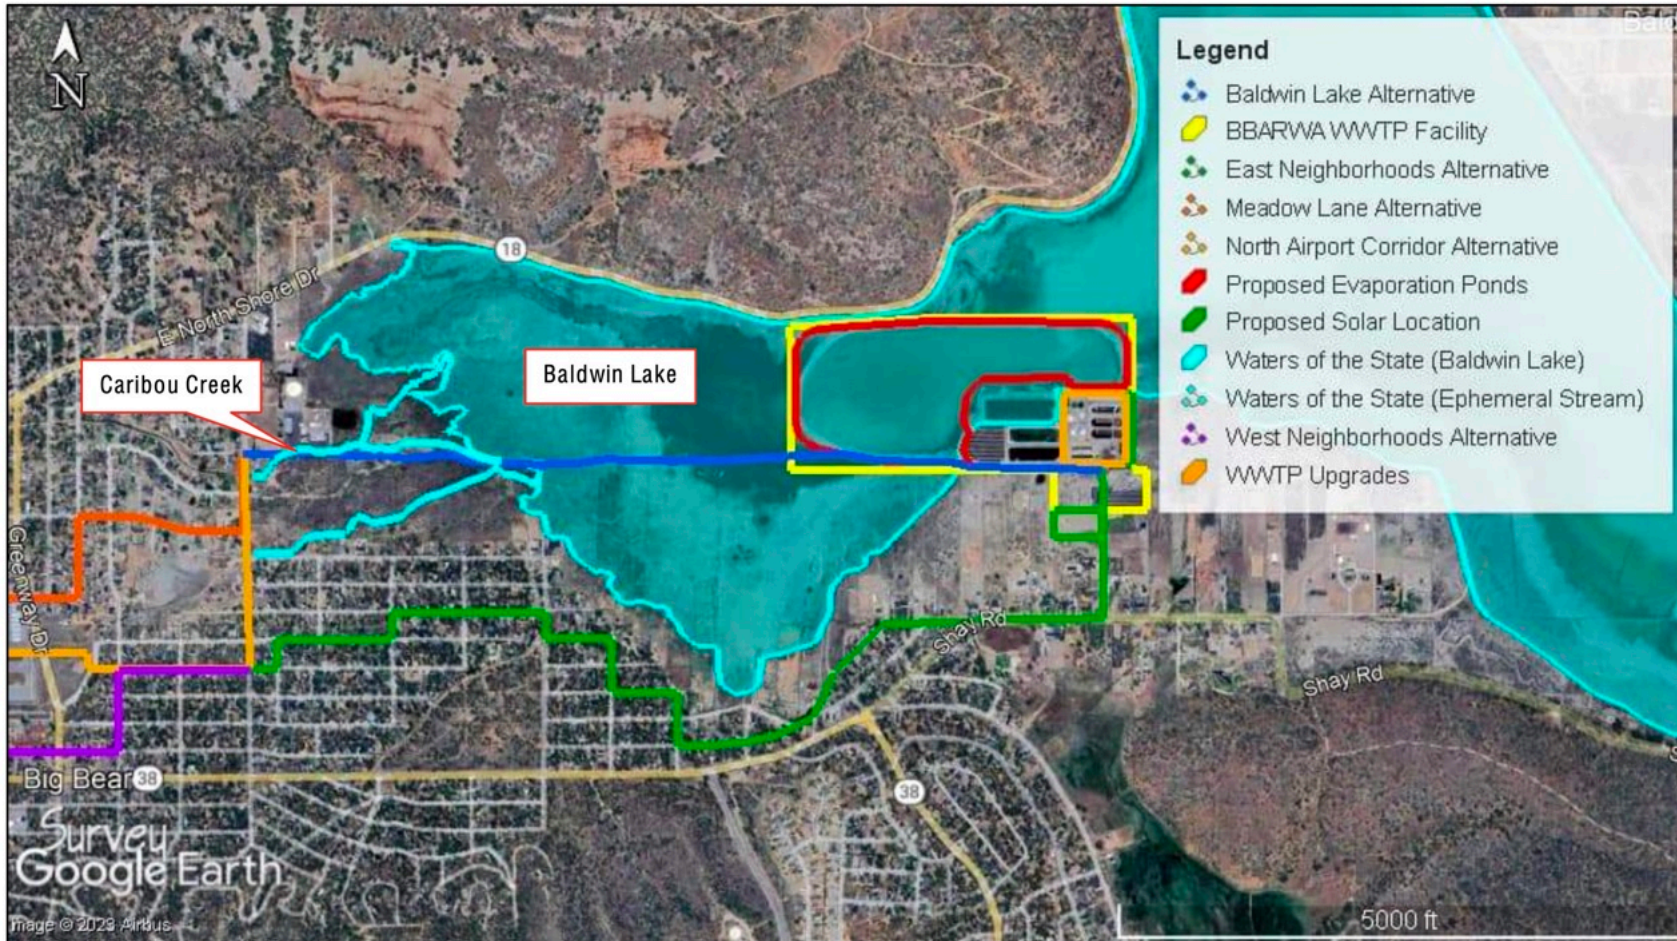

Based on the type of site modifications proposed as part of the Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, it is not anticipated that discharge of dredged or fill material into Waters of the U.S. requiring a USACE 404 Permit would be required. However, as the Stanfield Marsh Conveyance Pipeline Discharge Outlet(s) is a part of this Project, and, for the same reasons outlined above under CWA Section 401 permitting, based on the design of this project, it is known that discharge to Waters of the U.S. will occur. Therefore, violation of State water quality standards for Waters of the U.S. may occur and a CWA Section 401 permit is likely to be required. Thus, mitigation (**MM BIO-26** and **BIO-27**) is required to minimize impacts to a level of less than significant.

Waste discharges that can be exempted from the California Code of Regulations requirements are issued WDRs and are regulated by the WDR Program. Typical discharge types include domestic or municipal wastewater, food processing related wastewater, and industrial wastewater. Thus, the actions proposed by the Baldwin Lake Pipeline Alignment Option is anticipated to require a WDR issued by the RWQCB. This is a mandatory requirement that does not require mitigation to ensure compliance. Thus, impacts related to compliance with RWQCB WDR requirements from implementation of the Baldwin Lake Pipeline Alignment Option would be less than significant.

FGC Section 1602 Lake or Streambed Alteration Agreement

An FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the project), a copy of the appropriate CEQA documentation must be included with the application.

In addition to the BRA field survey, Jacobs also assessed the proposed Program Area footprint for the presence of any State and/or Federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (**Figure 4.5-11**). Therefore, any proposed permanent or temporary impacts to Stanfield Marsh associated with the Stanfield Marsh Conveyance Pipeline Discharge Outlet may require CWA Sections 404/401 permits from the USACE and RWQCB, as well as a LSA Agreement from the CDFW. Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel are all waters of the State of California (**Figures 4.5-12 through 4.5-15**). Therefore, potential Program impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Program Components that may impact State and/or Federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Program related impacts to aquatic resources and the appropriate regulatory permitting (if any) required. If the FGC Section 1602 LSA Agreement requirements were not met by Program implementation, a significant impact under this issue could occur. Based on the design of this project, temporary impacts to Stanfield Marsh associated with the Stanfield Marsh Conveyance Pipeline Discharge Outlet may require CWA Sections 404/401 permits from the USACE and RWQCB, as well as a LSA Agreement from the CDFW.

FIGURE 12e

FIGURE 4.5-15

Thus, mitigation is required to minimize impacts to a level of less than significant. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project.

The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, mitigation is required to minimize impacts to a level of less than significant.

Baldwin Lake is a water of the State of California, and as the Baldwin Lake Pipeline Alignment Option traverses through Baldwin Lake, potential Program impacts to aquatic resources from implementation of this project would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Thus, mitigation (**MM BIO-14 through BIO-25, BIO-26 and BIO-27**) is required to minimize impacts to a level of less than significant.

For all other Stanfield Marsh/Big Bear Lake Discharge Pipeline Alignment Options, the area that would be impacted has been completely developed, and therefore, it is not anticipated that an FGC Section 1602 LSA Agreement would be required. Therefore, no impacts related to compliance with the FGC Section 1602 would be anticipated.

Other Physical Changes to the Environment

No physical changes beyond that which presently occurs or could occur under the existing conditions at the LV Site are proposed by the Replenish Big Bear Program. As such, no biological resources, including federally protected wetlands, of which none exists at the LV Site, are expected to be directly or indirectly impacted by the reduced discharge to the LV Site that would occur as a result of Program implementation.

Level of Significance Before Mitigation: Potentially Significant

Mitigation Measures:

MMs BIO-14 through BIO-25 are required to minimize direct and indirect effects to federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means. For discussion of **MMs BIO-14 through BIO-25**, please refer to analysis above throughout this section. **BIO-26 and BIO-27** are discussed below:

BIO-14 **Prior to the commencement of construction within or adjacent to any natural area, and during the appropriate periods (e.g., seasons, weather conditions, times of day), a biologist/botanist shall survey the APE to identify native species (alliances, variety, and/or subspecies) within the natural areas that would be appropriate for revegetation.**

As part of completion of the final site development, after ground disturbance has occurred within or adjacent to any natural area, the disturbed areas shall be revegetated using a plant mix of native plant species that are suitable for long term vegetation management at the specific site **as identified by the site biologist/botanist pre-construction survey**, which shall be implemented in cooperation with regulatory agencies and with oversight from a biologist. The seeds mix shall be verified to contain **the minimum amount of no** invasive plant species seeds. **If seed mix without potential invasive species does not exist for the native species to the APE, the seed mix shall contain the absolute minimum amount of invasive species** reasonably available for the Program Area.

BIO-15 *During construction, equipment will be washed before entering the project footprint to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species. Mud and plant materials will be removed from construction equipment when working in native plant communities, near special-status plant communities, or in areas where special-status plant species have been identified.*

BIO-16 *Personnel who work onsite will attend a Contractor Education and Environmental Training session conducted by a biologist. The environmental training will cover general and specific biological information on the special-status plant species that may be present near the construction site, including the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws.*

The Contractor Education and Environmental Training sessions will be given before the initiation of construction activities and repeated, as needed, when new personnel begin work within the project limits. Daily updates and synopsis of the training will be performed during the daily safety (“tailgate”) meeting. All personnel who attend the training will be required to sign an attendance list stating that they have received the Contractor Education and Environmental Training, and such tracking sheets shall be maintained for inspection by the implementing agency.

BIO-17 *A biological monitor shall be present during construction Activities in areas where impacts to riparian, riverine, wetland, endangered species or endangered species Critical Habitat occurs. A biological monitor (or monitors) will be present onsite during construction activities that could result in direct or indirect impacts on sensitive biological resources (including listed species) and to oversee permit compliance and monitoring efforts for all special-status resources.*

A biological monitor (biologist) is any person who has a bachelor’s degree in biological sciences, zoology, botany, ecology, or a closely related field and/or has demonstrated field experience in and knowledge about the identification and life history of the special-status species or jurisdictional waters that could be affected by project activities. The

biological monitor(s) will be responsible for monitoring the Contractor to ensure compliance with the Section 404 Individual Permit, Section 401 Water Quality Certification and LSA Agreements. Activities to ensure compliance would include performing construction-monitoring activities, including monitoring environmental fencing, identifying areas where special-status plant species are or may be present, and advising the Contractor of methods that may minimize or avoid impacts on these resources. Biological monitor(s) will be required to be present in all areas during ground disturbance activities and for all construction activities conducted within or adjacent to identified Environmentally Sensitive Areas, Wildlife Exclusion Fencing, and Non-Disturbance Zones as defined by the project biologist.

- BIO-18** *All food-related trash items (e.g., wrappers, cans, bottles, food scraps) will be disposed of in closed containers and removed at least once a week from the construction site.*
- BIO-19** *Use of rodenticides and herbicides in the project footprint will be restricted at the direction of the project biologist. This measure is necessary to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species. Where pesticides must be used, they must be used in full accordance with use instructions for the particular chemical and at the direction of the project biologist.*
- BIO-20** *Exclusion barriers (e.g., silt fences) will be installed at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction. The design specifications of the exclusion fencing will be determined through consultation with the USFWS and/or CDFW, as appropriate. Clearance surveys will be conducted for special-status species after the exclusion fence is installed in compliance with USFWS and/or CDFW requirements. The project biologist shall determine the frequency in which clearance surveys will be conducted to determine the efficacy of the exclusion fencing.*
- BIO-21** *Prior to the commencement of construction, the implementing agency shall identify staging areas for construction equipment to be utilized during construction that will be located outside sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridors.*
- BIO-22** *Plastic mono-filament netting (erosion-control matting) or similar material will not be used in erosion control materials to prevent potential harm to wildlife. Materials such as coconut coir matting or tackified hydroseeding compounds will be used as substitutes.*
- BIO-23** *During ground-disturbing activities, project-related vehicle traffic will be restricted within the construction area to established roads, construction areas, and other designated areas to prevent avoidable impacts. Access routes will be clearly flagged; traffic outside of the designated areas will be prohibited. Furthermore, the use of motorized vehicles within sensitive habitat areas and linkages shall be prohibited except for crucial maintenance and/or construction activities.*
- BIO-24** *All excavated, steep-sided holes or trenches more than 8 inches deep will be covered at the close of each working day with plywood or similar materials, or a minimum of one escape ramp constructed of earth fill for every 10 feet of trenching will be provided to prevent the entrapment of wildlife. Before such holes or trenches are filled, they will be thoroughly inspected for trapped animals. All culverts or similar enclosed structures with a diameter of 4 inches or greater will be covered, screened, or stored more than 1 foot off the ground to prevent use by wildlife. Stored material will be cleared for common and special-status wildlife species before the pipe is subsequently used or moved.*

BIO-25 *Prior to the commencement of construction, a Weed Control Plan will be developed for the implementing agency by the project biologist to minimize or avoid the spread of weeds during ground-disturbing activities. In the Weed Control Plan, the following topics will be addressed:*

- *A Schedule for noxious weed surveys shall be addressed.*
- *Weed control treatments shall be addressed and ultimately implemented by the implementing agency, including permitted herbicides, and manual and mechanical methods for application; herbicide application will be restricted in Environmentally Sensitive Areas (as defined by the project biologist).*
- *The timing of the weed control treatment for each plant species shall be addressed.*
- *Fire prevention measures shall be addressed.*

The implementing agency shall maintain records demonstrating implementation of the Weed Control Plan, and shall make those records available to inspection by the implementing agency upon request.

BIO-26 *Any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation. Mitigation can be provided by restoration of temporary impacts, enhancement of existing resources, or purchasing into any authorized mitigation bank or in-lieu fee program; by selecting a site of comparable acreage near the site and enhancing it with a native riparian habitat or invasive species removal in accordance with a habitat mitigation plan approved by regulatory agencies; or by acquiring sufficient compensating habitat to meet regulatory agency requirements. ~~Typically, regulatory agencies require mitigation for~~ Impacts to jurisdictional waters ~~without any riparian or wetland habitat shall to~~ be mitigated at a minimum 1:1 ratio, with the ultimate compensatory mitigation ratio being determined through negotiation with regulatory agency, and never at a rate of less than 1:1. For loss of any riparian or other wetland areas, the mitigation ratio will begin at 2:1, and t~~t~~ The ratio will rise based on the type of habitat, habitat quality, and presence of sensitive or listed plants or animals in the affected area. This increase in ratio will be determined by the regulatory agency, and must be deemed sufficient by the regulatory agency issuing the permit to compensate for/offset the impacts to the jurisdictional waters and supported species and habitats therein. A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.*

BIO-27 *A federal and state jurisdictional water preconstruction survey shall be conducted by a biologist or regulatory specialist at least six months before the start of ground-disturbing activities to identify and map all jurisdictional waters in the project footprint and up to a 250-foot buffer around the project footprint, subject to legal property access restrictions. The purpose of this survey is to confirm the extent of jurisdictional waters as defined by state and federal law are within the project footprint and adjacent up to 250-foot buffer. If possible, surveys would be performed during the spring, when plant species are in bloom and hydrological indicators are most readily identifiable. These results would then be used to calculate impact acreages and determine the amount of compensatory mitigation required to offset the loss of wetland functions and values in accordance with MM BIO-26.*

Level of Significance After Mitigation: Less Than Significant

As stated above, unforeseen direct impacts, indirect impacts, and temporary impacts to natural and man-made water bodies may occur depending upon the design of the infrastructure improvement, and the construction methodology required. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. Furthermore, **MMs BIO-14 through BIO-25** address the potential for ongoing and project-specific protections to the environment to prevent direct and indirect effects that could affect federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means by future Program facilities.

MM BIO-14 would require revegetation of natural areas with native species to minimize the Project's temporary impacts on wetlands within the area.

MM BIO-15 would require equipment to be washed to reduce potential indirect impacts from inadvertent introduction of nonnative invasive plant species that could impact wetlands.

MM BIO-16 would require contractor education and environmental training to be conducted by a biologist that would cover specific biological information on the special status species and habitats that may occur in the Program area, and inform the construction workers of the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws. This would further minimize the potential for wetlands to be impacted during construction as a result of construction worker awareness.

MM BIO-17 would require a biological monitor to be present during construction in areas where Riparian, Riverine, Wetland, Endangered Species or Endangered Species Critical habitat occurs. The monitor would ensure that construction workers avoid direct or indirect impacts on sensitive biological resources, including wetlands thereby minimizing any impacts thereof.

MM BIO-18 would ensure that food related trash items are disposed of properly so as to not inadvertently attract any wildlife to the site, or result in litter that could result in impacts to nearby wetlands habitats, thereby minimizing any impacts thereof.

MM BIO-19 would prevent the use of rodenticides and herbicides to prevent poisoning of wetlands, thereby minimizing any impacts thereof.

MM BIO-20 would require exclusion barriers at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction, and movement adjacent to the construction area that could impact wetlands, thereby minimizing any impacts thereof.

MM BIO-21 would identify construction staging areas outside of sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridor to reduce impacts thereof.

MM BIO-22 would prevent the use of plastic mono-filament netting (erosion-control matting) or similar material in order to prevent potential harm to wetlands, thereby minimize impacts thereof.

MM BIO-23 would require construction traffic to be limited to established roads to prevent impacts to sensitive habitats, including wetlands, that may be present outside of these established routes. This would minimize impacts to wetlands.

MM BIO-24 would require the closure of holes or trenches at the end of each day to avoid entrapment of wildlife, including wildlife that is supported by wetlands, and thereby minimize impacts thereof.

MM BIO-25 would require the implementation of a weed control plan to minimize or avoid the spread of weeds that could encroach on special status species and habitats, including wetlands, thereby minimizing impacts thereof.

Thus, through the implementation of mitigation, the Program would have a less than significant impact on federally and state protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

Cumulative Impact Analysis

The conversion of undeveloped areas to cumulative development, within the Big Bear Valley may increase effects on protected wetland habitats. Cumulative development that encroaches into wetland habitat areas or indirectly impacts wetland habitat through the increase of upstream urban runoff could result in a cumulatively significant impact. Other cumulative impacts may include direct impacts such as the removal or modification of local hydrology, the redirection of flow, and the placement of fill material. Potential indirect impacts on jurisdictional waters include a number of water-quality-related impacts: erosion and transport of fine sediments or fill downstream of construction to unintentional release of contaminants into jurisdictional waters that are outside of the project footprint. Temporary impacts on jurisdictional waters include the placement of temporary fill during construction in both man-made and natural jurisdictional waters. Temporary fill could be placed during the construction of access roads and staging/equipment storage areas. The temporary fill would result in a temporary loss of jurisdictional waters and could potentially increase erosion and sediment transport into adjacent areas.

Since the Program could potentially benefit wetlands and habitats at Stanfield Marsh and Big Bear Lake, and because the proposed Program would not significantly impact wetlands elsewhere in the Big Bear Valley as a result of development of Program facilities, the Program's contribution to potential impacts on wetland habitat would be less than cumulatively considerable with the implementation of mitigation. Implementation of **MMs BIO-14 through BIO-27** would reduce the future facilities under the Program's contribution to cumulative wetland impacts to less than cumulatively considerable through compensation and implementation of construction and operational BMPs to control stormwater pollutants from exiting a proposed facility site and compliance with regulatory requirements.

*Cumulative Measures: **MMs BIO-14 through BIO-27** are required to minimize direct and indirect cumulative effects to riparian habitat or other sensitive natural communities.*

Level of Significance After Mitigation: Less Than Significant

d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Please refer to the discussion under issue (a), above. The proposed Program will be developed within the Big Bear Valley, which contains many areas that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites.

As biological resource impacts are highly site dependent, the following discussion analyzes the potential impacts to sensitive habitats on each project site location. These locations are:

- **BBARWA WWTP Upgrades Project**
 - BBARWA WWTP Upgrades
- **Solar Evaporation Ponds Project**
 - Solar Evaporation Ponds at the BBARWA WWTP Site
- **Sand Canyon Recharge Project**
 - Sand Canyon Recharge Conveyance Pipeline
 - Sand Canyon Conveyance Pipeline Discharge Outlet
 - Sand Canyon Booster Station
 - Sand Canyon Monitoring Wells (locations unknown)
- **Shay Pond Discharge Project**
 - Shay Pond Replacement Pipeline
 - Shay Pond Conveyance Pipeline Alignment
- **Stanfield Marsh/Big Bear Lake Discharge Project**
 - Stanfield Marsh Conveyance Pipeline Discharge Outlets
 - Alignment Option 1 to Discharge Point 1
 - Baldwin Lake Pipeline Alignment Option
 - Meadow Lane Pipeline Alignment Option
 - Alignment Option 2 to Discharge Point 2
 - East Neighborhoods Pipeline Alignment Option
 - West Neighborhoods Pipeline Alignment Option

BBARWA WWTP Upgrades Project

There are many stream channels that traverse this area that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. The creeks and bodies of water listed below are shown on **Figures 4.5-11 through 4.5-15**. For the BBARWA WWTP Upgrades, the following impacts on wildlife movement or migration may occur:

- **Construction Impacts:** These facilities are anticipated to be confined to already developed spaces that would not serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. This is particularly the case because the BBARWA facility is fenced, which prevents wildlife movement on the ground in the area. However, it is possible that trees or vegetation within the existing BBARWA site may support nesting birds. As such, mitigation to protect nesting birds (**MMs BIO-16, BIO-28 and BIO-29**) is necessary to minimize impacts thereof. Impacts would be less than significant with the implementation of mitigation.
- **Operational Impacts:** Once installed, these facilities installed at the BBARWA site would be consistent with the existing wastewater facilities located at the BBARWA site, and as

the overall setting of the site would remain confined to the existing developed spaces, no operational changes in wildlife movement would be anticipated to occur.

Solar Evaporation Ponds Project

There are many stream channels that traverse this area that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. The creeks and bodies of water listed below are shown on **Figures 4.5-11 through 4.5-15**. For the Solar Evaporation Ponds, the following impacts on wildlife movement or migration may occur:

- **Construction Impacts:** This facility is anticipated to be confined to already developed spaces that would not serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. This is particularly the case because the BBARWA facility is fenced, which prevents wildlife movement on the ground in the area. However, it is possible that trees or vegetation within the existing BBARWA site may support nesting birds. As such, mitigation to protect nesting birds (**MMs BIO-16, BIO-28 and BIO-29**) is necessary to minimize impacts thereof. Impacts would be less than significant with the implementation of mitigation.
- **Operational Impacts:** One of the commenters on the NOP raised concern that waterfowl may utilize the brine settlement ponds, when full, which could result in significant impacts should the waterfowl consume the brine. As such, as mitigation is necessary to minimize the potential for birds to utilize the Solar Evaporation Ponds.

Sand Canyon Recharge Project

There are many stream channels that traverse this area that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. The creeks and bodies of water listed below are shown on **Figures 4.5-11 through 4.5-15**. For the Sand Canyon Monitoring Wells downstream of Sand Canyon, the following impacts on wildlife movement or migration may occur:

- **Construction Impacts:** The monitoring wells are anticipated to be confined to already developed spaces that would not serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. However, as the locations are presently unknown, it is possible that trees or vegetation within these sites may support nesting birds. As such, mitigation to protect nesting birds (**MMs BIO-16, BIO-28 and BIO-29**) is necessary to minimize impacts thereof. Impacts would be less than significant with the implementation of mitigation.
- **Operational Impacts:** Once installed, the monitoring wells would occupy a small footprint within already developed spaces that would not serve to enable movement of native resident or migratory fish or wildlife species, and as the overall setting of the site would remain confined to developed spaces, no operational changes in wildlife movement would be anticipated to occur.

For the Sand Canyon Recharge Conveyance Pipeline, the following impacts on wildlife movement or migration may occur:

- **Construction Impacts:** This pipeline alignment would occur within existing road ROW or within a small portion of forested area within residentially owned property by which an easement would be acquired to facilitate the installation of the proposed Sand Canyon Recharge Conveyance Pipeline. It is anticipated that the entirety of the pipeline alignment

is confined within roadways and developed populated areas that would not serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. However, it is possible that trees or vegetation within the project footprint may support nesting birds. As such, mitigation to protect nesting birds (**MMs BIO-16, BIO-28 and BIO-29**) is necessary to minimize impacts thereof.

- Operational Impacts: Once installed, the pipeline would be located below ground, and the outlet would be located below grade. The surface will be recompacted and returned to original condition, thereby no operational changes in wildlife movement would be anticipated to occur.

For the Sand Canyon Conveyance Pipeline Discharge Outlet, the following impacts on wildlife movement or migration may occur:

- Construction Impacts: The Sand Canyon Channel could result in construction impacts from the installation of the Sand Canyon outlet may cause adverse impacts on migratory species through disturbing or harming nesting birds, which protected under the MTBA, but given the very small footprint of the outlet, and similar to the discharge point at Stanfield Marsh, these impacts would be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that wildlife linkages and corridors are maintained and impacts thereof are minimized for the temporary duration of construction. As stated above, **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project, and thereby may impact wildlife linkages and/or wildlife corridors. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. The impacts to jurisdictional features would thereby be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that wildlife linkages and corridors are maintained for the temporary duration of construction. Thus, with implementation of mitigation, impacts would be less than significant.
- Operational Impacts: Once installed, the outlet would be located below grade. The footprint of the outlet would occupy less than a 10' x 10' area, including the erosion control, which would be designed to blend in with the existing channel surface area. As this feature would be of a small footprint and would be of a small surface area that would not block access to the channel by wildlife, no wildlife movement would be anticipated to be impacted over the long-term.

For the Sand Canyon Booster Station, the following impacts on wildlife movement or migration may occur:

- Construction Impacts: This facility is anticipated to be confined to already developed spaces that would not serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. However, it is possible that trees or vegetation within the Sand Canyon Booster Station site may support nesting birds. As such, mitigation to protect nesting birds (**MMs BIO-28 and BIO-29**) is necessary to minimize impacts thereof.

- Operational Impacts: Once installed, the Sand Canyon Booster Station would be consistent with the existing water storage facilities located at the Pump Station site, and as the overall setting of the site would remain confined to the existing developed spaces, no operational changes in wildlife movement would be anticipated to occur.

Shay Pond Discharge Project

There are many stream channels that traverse this area that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. The creeks and bodies of water listed below are shown on **Figures 4.5-11 through 4.5-15**. For the new Shay Pond Pipeline and Shay Pond Replacement Pipeline, the following impacts on wildlife movement or migration may occur:

- Construction Impacts: Shay Pond/Shay Creek could result in construction impacts from the installation of the Shay Pond Replacement Pipeline and new Shay Pond Conveyance Pipeline. Construction may cause adverse impacts on migratory species through disturbing or harming nesting birds, which protected under the MTBA, but similar to the discharge point at Stanfield Marsh, these impacts would be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that wildlife linkages and corridors are maintained and impacts thereof are minimized for the temporary duration of construction. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project, and thereby may impact wildlife linkages and/or wildlife corridors. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. The impacts to jurisdictional features would thereby be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that wildlife linkages and corridors are maintained for the temporary duration of construction. Thus, with implementation of mitigation, impacts would be less than significant.
- Operational Impacts: Once installed, the Shay Pond pipeline would be located below ground, and the outlet would be located below grade. The surface will be recompact and returned to original condition, thereby no operational changes in wildlife movement would be anticipated to occur.

Stanfield Marsh/Big Bear Lake Discharge Project

There are many stream channels that traverse this area that could serve to enable movement of native resident or migratory fish or wildlife species, or serve established native resident or migratory wildlife movement corridors, or serve as native wildlife nursery sites. The creeks and bodies of water listed below are shown on **Figures 4.5-11 through 4.5-15**. Discharge Pipeline and outlet to Stanfield Marsh:

- Construction Impacts: Baldwin Lake, Caribou Creek, Stanfield Marsh and Big Bear Lake could be impacted in various ways by the proposed Program. Stanfield Marsh and Big Bear Lake are anticipated to benefit from the implementation of the proposed Program as a result of increased water available in Big Bear Lake. The discharge point at Stanfield Marsh will be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that

wildlife linkages and corridors are maintained for the temporary duration of construction. **MM BIO-26** would ensure that jurisdictional features are documented in accordance with state and federal guidelines. This would aid in identification of jurisdictional features that may be impacted by discharge of fill or streambed alteration by a future Program project, and thereby may impact wildlife linkages and/or wildlife corridors. The implementation of **MM BIO-27** would ensure that future projects that would discharge of fill or streambed alteration of state or federal water jurisdictional areas are designed to minimize and be protective of the environment both during construction, and once operational for activities that would require ongoing maintenance within jurisdictional features. The impacts to jurisdictional features would thereby be subject to the provisions of regulatory permitting (CWA Section 401 and 404 permitting, and FGC Section 1602 LSA Agreement permitting), which would ensure that wildlife linkages and corridors are maintained for the temporary duration of construction. Thus, with implementation of mitigation, impacts would be less than significant.

Based on the discussion under issue (a) (which asks, would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the CDFW and USFWS?), above, the proposed discharge of Program Water to Stanfield Marsh/Big Bear Lake would have a less than significant potential to obstruct the beneficial use of either Stanfield Marsh or Big Bear Lake with the implementation of **MM HYD-1**. Protecting the beneficial uses of these water bodies would protect the RARE⁷⁹ and WILD⁸⁰ designations of Stanfield Marsh and Big Bear Lake, thereby minimizing impacts to migratory species supported by Stanfield Marsh and Big Bear Lake. This is because migratory species, in addition to special status species, and other animals and habitats are protected under these beneficial use designations. Furthermore, migratory species utilizing Stanfield Marsh and Big Bear Lake would likely experience enhanced habitat as a result of the proposed Program, and thereby would not be subject to adverse impacts from the proposed Program.

- Operational Impacts: Once installed, the pipeline would be located below ground, and the outlet would be located below grade. The surface will be recompacted and returned to original condition, thereby no operational changes in wildlife movement would be anticipated to occur.

All facilities: in regards to nesting bird impacts, although BAEA and SPOW are not likely to nest in the Program Area due to existing disturbances within and adjacent the proposed Program footprint, the Program Area is suitable to support other nesting bird species. Most native bird species are protected from unlawful take by the MBTA. Additionally, the State of California provides protection for native bird species and their nests in the FGC. In general, impacts to all bird species (common and special status) can be avoided by conducting work outside of the nesting season, which is generally February 1st through August 31st. However, if all work cannot be conducted outside of nesting season, the precautionary measures are recommended to ensure MBTA compliance.

⁷⁹ Rare, Threatened, or Endangered Species (RARE) Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

⁸⁰ Wildlife Habitat (WILD) Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.

Other Physical Changes to the Environment

No physical changes beyond that which presently occurs or could occur under the existing conditions at the LV Site are proposed by the Replenish Big Bear Program. As such, no wildlife movement would be expected to be directly or indirectly impacted by the reduced discharge to the LV Site that would occur as a result of Program implementation.

Level of Significance Before Mitigation: Potentially Significant

*Mitigation Measures: **MMs BIO-16 and BIO-26, BIO-27, BIO-28, BIO-29 and HYD-1** are required to minimize the Program's potential to interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. For discussion of **MMs BIO-16 and HYD-1** please refer to analysis above throughout this section. **MMs BIO-28 and BIO-29** are discussed below:*

BIO-16 *Personnel who work onsite will attend a Contractor Education and Environmental Training session conducted by a biologist. The environmental training will cover general and specific biological information on the special-status plant species that may be present near the construction site, including the distribution of the resources, the recovery efforts, the legal status of the resources, and the penalties for violation of project permits and laws.*

The Contractor Education and Environmental Training sessions will be given before the initiation of construction activities and repeated, as needed, when new personnel begin work within the project limits. Daily updates and synopsis of the training will be performed during the daily safety ("tailgate") meeting. All personnel who attend the training will be required to sign an attendance list stating that they have received the Contractor Education and Environmental Training, and such tracking sheets shall be maintained for inspection by the implementing agency.

BIO-17 *A biological monitor shall be present during construction Activities in areas where impacts to riparian, riverine, wetland, endangered species or endangered species Critical Habitat occurs. A biological monitor (or monitors) will be present onsite during construction activities that could result in direct or indirect impacts on sensitive biological resources (including listed species) and to oversee permit compliance and monitoring efforts for all special-status resources.*

A biological monitor (biologist) is any person who has a bachelor's degree in biological sciences, zoology, botany, ecology, or a closely related field and/or has demonstrated field experience in and knowledge about the identification and life history of the special-status species or jurisdictional waters that could be affected by project activities. The biological monitor(s) will be responsible for monitoring the Contractor to ensure compliance with the Section 404 Individual Permit, Section 401 Water Quality Certification and LSA Agreements. Activities to ensure compliance would include performing construction-monitoring activities, including monitoring environmental fencing, identifying areas where special-status plant species are or may be present, and advising the Contractor of methods that may minimize or avoid impacts on these resources. Biological monitor(s) will be required to be present in all areas during ground disturbance activities and for all construction activities conducted within or adjacent to identified Environmentally Sensitive Areas, Wildlife Exclusion Fencing, and Non-Disturbance Zones as defined by the project biologist.

BIO-18 *All food-related trash items (e.g., wrappers, cans, bottles, food scraps) will be disposed of in closed containers and removed at least once a week from the construction site.*

- BIO-19** *Use of rodenticides and herbicides in the project footprint will be restricted at the direction of the project biologist. This measure is necessary to prevent poisoning of special-status species and the potential reduction or depletion of the prey populations of special-status wildlife species. Where pesticides must be used, they must be used in full accordance with use instructions for the particular chemical and at the direction of the project biologist.*
- BIO-20** *Exclusion barriers (e.g., silt fences) will be installed at the edge of the construction footprint and along the outer perimeter of Environmentally Sensitive Areas and Environmentally Restricted Areas as defined by the project biologist prior to the commencement of construction activities to restrict special-status species from entering the construction area during construction. The design specifications of the exclusion fencing will be determined through consultation with the USFWS and/or CDFW, as appropriate. Clearance surveys will be conducted for special-status species after the exclusion fence is installed in compliance with USFWS and/or CDFW requirements. The project biologist shall determine the frequency in which clearance surveys will be conducted to determine the efficacy of the exclusion fencing.*
- BIO-21** *Prior to the commencement of construction, the implementing agency shall identify staging areas for construction equipment to be utilized during construction that will be located outside sensitive biological resources areas, including habitat for special-status species, jurisdictional waters, and wildlife movement corridors.*
- BIO-22** *Plastic mono-filament netting (erosion-control matting) or similar material will not be used in erosion control materials to prevent potential harm to wildlife. Materials such as coconut coir matting or tackified hydroseeding compounds will be used as substitutes.*
- BIO-23** *During ground-disturbing activities, project-related vehicle traffic will be restricted within the construction area to established roads, construction areas, and other designated areas to prevent avoidable impacts. Access routes will be clearly flagged; traffic outside of the designated areas will be prohibited. Furthermore, the use of motorized vehicles within sensitive habitat areas and linkages shall be prohibited except for crucial maintenance and/or construction activities.*
- BIO-24** *All excavated, steep-sided holes or trenches more than 8 inches deep will be covered at the close of each working day with plywood or similar materials, or a minimum of one escape ramp constructed of earth fill for every 10 feet of trenching will be provided to prevent the entrapment of wildlife. Before such holes or trenches are filled, they will be thoroughly inspected for trapped animals. All culverts or similar enclosed structures with a diameter of 4 inches or greater will be covered, screened, or stored more than 1 foot off the ground to prevent use by wildlife. Stored material will be cleared for common and special-status wildlife species before the pipe is subsequently used or moved.*
- BIO-25** *Prior to the commencement of construction, a Weed Control Plan will be developed for the implementing agency by the project biologist to minimize or avoid the spread of weeds during ground-disturbing activities. In the Weed Control Plan, the following topics will be addressed:*
- *A Schedule for noxious weed surveys shall be addressed.*
 - *Weed control treatments shall be addressed and ultimately implemented by the implementing agency, including permitted herbicides, and manual and mechanical methods for application; herbicide application will be restricted in Environmentally Sensitive Areas (as defined by the project biologist).*
 - *The timing of the weed control treatment for each plant species shall be addressed.*
 - *Fire prevention measures shall be addressed.*

The implementing agency shall maintain records demonstrating implementation of the Weed Control Plan, and shall make those records available to inspection by the implementing agency upon request.

BIO-26 *Any future project that must discharge fill into a channel or otherwise alter a streambed shall be minimized to the extent feasible, and any discharge of fill not avoidable shall be mitigated through compensatory mitigation. Mitigation can be provided by restoration of temporary impacts, enhancement of existing resources, or purchasing into any authorized mitigation bank or in-lieu fee program; by selecting a site of comparable acreage near the site and enhancing it with a native riparian habitat or invasive species removal in accordance with a habitat mitigation plan approved by regulatory agencies; or by acquiring sufficient compensating habitat to meet regulatory agency requirements. ~~Typically, regulatory agencies require mitigation for~~ Impacts to jurisdictional waters ~~without any riparian or wetland habitat shall to~~ be mitigated at a minimum 1:1 ratio, with the ultimate compensatory mitigation ratio being determined through negotiation with regulatory agency, and never at a rate of less than 1:1. For loss of any riparian or other wetland areas, the mitigation ratio will begin at 2:1, and tThe ratio will rise based on the type of habitat, habitat quality, and presence of sensitive or listed plants or animals in the affected area. This increase in ratio will be determined by the regulatory agency, and must be deemed sufficient by the regulatory agency issuing the permit to compensate for/offset the impacts to the jurisdictional waters and supported species and habitats therein. A Habitat Mitigation and Monitoring Proposal shall be prepared by a biologist or regulatory specialist and reviewed and approved by the appropriate regulatory agencies. These agencies (USACE, RWQCB, CDFW and any other applicable regulatory agency with jurisdiction over the proposed facility improvement) can impose greater mitigation requirements in their permits, but the implementing agency will utilize the ratios outlined above as the minimum required to offset or compensate for impacts to jurisdictional waters, riparian areas or other wetlands.*

BIO-27 *A federal and state jurisdictional water preconstruction survey shall be conducted by a biologist or regulatory specialist at least six months before the start of ground-disturbing activities to identify and map all jurisdictional waters in the project footprint and up to a 250-foot buffer around the project footprint, subject to legal property access restrictions. The purpose of this survey is to confirm the extent of jurisdictional waters as defined by state and federal law are within the project footprint and adjacent up to 250-foot buffer. If possible, surveys would be performed during the spring, when plant species are in bloom and hydrological indicators are most readily identifiable. These results would then be used to calculate impact acreages and determine the amount of compensatory mitigation required to offset the loss of wetland functions and values in accordance with BIO-26.*

BIO-28 *To avoid an illegal take of active bird nests, any grubbing, brushing or tree removal will be conducted outside of the State identified nesting season for applicable bird species (nesting season is approximately from February 15 through September 15 of a given calendar year, depending on the species). ~~Alternatively~~ Additionally, at the discretion of a qualified avian biologist, nesting bird surveys shall be required, where appropriate, regardless of the time of year shall be conducted by a qualified avian biologist no more than three (3) days prior to vegetation clearing or ground disturbance activities.*

- Preconstruction surveys shall focus on both direct and indirect evidence of nesting, including nest locations and nesting behavior. The qualified avian biologist will make every effort to avoid potential nest predation as a result of survey and monitoring efforts. If no active nests are found, no further action would be required. If an active nest is found, the biologist shall set appropriate no-work buffers around the nest which would be based upon the nesting species, its sensitivity to*

disturbance, nesting stage and expected types, intensity, and duration of disturbance. There are no standard nest buffers specified in the MBTA or within the FGC. Disturbance factors including nest location, human activity, activity duration, and noise level may influence nesting behavior and reproductive success, shall be considered by the project biologist in coordination with CDFW and USFWS (as appropriate) in establishing standard buffer distances for individual species on a project- and site-specific basis. The nest(s) and buffer zones shall be field checked weekly by a qualified biological monitor. The approved no-work buffer zone shall be clearly marked in the field, within which no disturbance activity should commence until the qualified biologist has determined the young birds have successfully fledged and the nest is inactive.

- *Preconstruction nesting bird surveys shall include a nighttime component to address the potential for presence of nocturnal species. The nesting bird surveys shall consist of a minimum of five (5) consecutive survey days and shall include an additional three (3) consecutive nights of survey for nocturnal species. Nocturnal surveys shall be conducted between the hours of 9:00 pm. and midnight, during appropriate weather conditions (e.g., no rain or winds).*
- *Vegetation removal, including any tree removal or pruning, and structure demolition shall be conducted outside the typical nesting season (i.e., between September 1st and January 31st), to the maximum extent feasible. Otherwise, the provisions of the preconstruction nesting bird surveys, above, shall suffice to ensure impacts to nesting birds are minimized.*

BIO-29 *To avoid any harm to waterfowl that may utilize the Solar Evaporation Ponds, BBARWA shall install bird deterrents at the Solar Evaporation Ponds to discourage waterfowl use of the ponds. The deterrent shall encompass access control through tarps or screens limiting bird access to the surface of the Solar Evaporation Ponds.*

HYD-1 *BBARWA, in collaboration with BBMWD and BBCCSD, will collect samples at the pertaining locations. That is BBARWA will monitor the Program Water, BBMWD will collect samples in the Stanfield Marsh and Big Bear Lake, and BBCCSD will collect samples in Shay Pond. BBARWA will develop the AAMP and will coordinate with BBMWD and BBCCSD to implement the AMMP for the proposed discharges to Stanfield Marsh/Big Bear Lake and Shay Pond (when implemented). The AMMP will consist of the following;*

- *Conduct a monitoring plan to:*
 - *Collect quarterly boron samples of Program Water (i.e., purified water before it is discharged to Stanfield Marsh or Shay Pond (when implemented)), at the existing TMDL Sampling Station MWDL9, and at Shay Pond (when implemented);*
 - *Monitor the dissolved oxygen and pH of the Program Water, in Stanfield Marsh (if permitted), at the existing TMDL Sampling Station MWDL9, and at Shay Pond (when implemented) during and after re-wetting of Stanfield Marsh or Shay Pond;*
 - *Continuously monitor temperature of the Program Water, Stanfield Marsh, and Shay Pond (when implemented); and*
 - *Collect quarterly chloride samples of Program Water stored in Big Bear Lake at the existing TMDL Sampling Station MWDL9 to assess the impacts on the Bear Valley Basin.*
 - *Collect nutrient (i.e., TIN, TP, TN, ammonia, nitrate as N, nitrite as N) samples of the Program Water at the frequency stated in the NPDES permit.*
- *Implement a TP Offset Program, expected to be stipulated in BBARWA's future NPDES permit;*
- *Monitor the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake on at least a bi-yearly basis. If observed, mitigative actions, such as invasive plant removal, introduction of native species known to eradicate*

invasive species, or other mitigative actions shall be undertaken to remove the invasive species present as a result of introduction of the Program Water. An account of invasive species within Stanfield Marsh and Big Bear Lake shall be undertaken prior to discharge into Stanfield Marsh to set a baseline for what invasive species exist prior to operation of the Program.

If temperature, dissolved oxygen, boron, or pH levels exceed the NPDES permit requirements, BBARWA shall pursue mitigation actions which may include, but are not limited to the following:

- *Introduction of chemical or mechanical intervention to stabilize pH levels and dissolved oxygen.*
- *Introduction of native plants to absorb boron at Stanfield Marsh or Shay Pond (when implemented).*
- *Introduction of a temperature cooling mechanism to lower the temperature of the Program Water before being introduced to the Stanfield Marsh or Shay Pond (when implemented).*

If recharging Program Water stored in Big Bear Lake would result in exceedance of any of the limits set in the future Sand Canyon Recharge Area WDR permit, the discharge of Program Water to the Sand Canyon Recharge Area would be paused until permit conditions are met.

The AMMP shall be aligned with the future requirements of the NPDES and WDR permits.

Level of Significance After Mitigation: Less Than Significant

Mitigation to protect nesting birds will be implemented by Watermaster and stakeholders of the Big Bear Valley in future through **MM BIO-28**. **MM BIO-28** will require a nesting bird survey that demonstrates that no bird nests will be disturbed during project construction, or construction will occur entirely outside of nesting season. This will ensure that nesting birds are not impacted by construction activities thereby ensuring compliance with the MBTA and Bird nesting protections (Sections 3503, 3503.5, 3511, and 3513) in the FGC. **MM BIO-29** would protect migratory birds that may otherwise use the Solar Evaporation Ponds when full during operation of the proposed Program in the future, and would therefore minimize operational impacts to migratory and nesting birds.
